SELECTED WATER RESOURCES ABSTRACTS

VOLUME 13, NUMBER 14
JULY 15, 1980

W80-04501-W80-04800
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the
Office of Water Research and Technology
U.S. Department of the Interior

VOLUME 13, NUMBER 14
JULY 15, 1980

W80-04501-W80-04800

The Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most our our nationally owned-public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographic citation and a set of identifiers or descriptors which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Office of Water Research and Technology.

To provide SWRA with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

The input from these Centers, and from the 54 Water Resources Research Institutes administered under the Water Research and Development Act of 1978, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies becomes the information base from which this journal is derived.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology
U.S. Department of the Interior
Washington, D.C. 20240

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

ROLE OF BOREHOLE GEOPHYSICS IN DEFINING THE PHYSICAL CHARACTERISTICS OF THE RAFT RIVER GEOTHERMAL RESERVOIR, IDAHO,
Geological Survey, Denver, CO. Water Resources Div.
W. S. Keys, and J. K. Sullivan.
Geophysics, Vol 44, No 6, p 1116-1141, June 1979. 26 Fig, 4 Tab, 11 Ref.

Descriptors: *Borehole geophysics, *Geothermal studies, *Groundwater, *Thermal water, *Idaho, Physical properties, Reservoirs, Logging(Recording), Deep wells, Computer models, Instrumentation, Borehole cameras, Radioisotopes, Raft River(Idaho).

Numerous geophysical logs have been made in three deep wells and in several intermediate depth core holes in the Raft River geothermal reservoir, Idaho. Laboratory analyses of cores from the intermediate depth holes were used to provide a qualitative and quantitative basis for a detailed interpretation of logs from the shallow part of the reservoir. A less detailed interpretation of logs from the deeper part of the reservoir is based on much less corroborative evidence. Extensive use was made of computer plotting techniques to arrive at some interpretations. Both the stratigraphic correlation utilizing a full suite of lots and the attitude of bedding calculated from acoustic televiewer logs indicate gentle dips throughout most of the reservoir with some local flexures. Televiewer logs permitted the location and orientation of numerous fractures and several features that may be faults. Temperature and flowmeter logs provide evidence that these fractures and faults are conduits that conduct hot water to the wells. One of the intermediate depth core holes penetrated a hydrothermally altered zone that includes several fractures producing hot water. This altered production zone could be distinguished by several logs. Borehole gamma spectrometry can be used to identify anomalous concentration of uranium, thorium, and potassium which are probably due to transportation by hydrothermal solutions. Computer crossplotting was used as an aid to the identification of such rock types as quartzite, quartz monzonite, and biotite schist in the deeper wells. Alteration of biotite schist to chlorite schist was also recognizable on these logs using computer-based analysis. Borehole geophysics not only provided much information on the Raft River geothermal reservoir but also permitted the lateral and vertical extrapolation of core and test data and bridged the gap between surface geophysical data and core analysis. PHYSICAL PROPERTIES OF CONFINED DREDGED MATERIALS,
Texas A and M Univ., College Station. Dept. of Soil and Crop Sciences.
K. W. Brown, K. W. Launius, and L. E. Deuel, Jr.
Soil Science, Vol 129, No 2, p 95-106, February 1980. 8 Fig, 2 Tab, 9 Ref. DACW39-75-C-0120.

Descriptors: *Dredging, *Physical properties, *Mineralogy, Slurries, Permeability, Shrinkage, Bulk density, Moisture content, Field capacity, Subsurface drainage, Plasticity index, *Dredged materials, *Confinement areas, Field-moisture data, Unsaturated permeabilities, Fine-grained-dredged materials, Volume changes, Moisture retention, Air drying.

Physical properties of fine-grained dredged materials from four diverse locations were determined. The results were useful to those involved in designing, managing, and reclaiming dredged-material-confinement areas. Many of the characteristics of the material were shown to undergo irreversible changes once the materials were dried. Initially, the material behaved like a slurry, but even after one drying, the properties changed so that the materials did not reswell to their original volume, the bulk density at a given moisture content was less, and the plasticity index was less. Physical properties of the materials were most closely correlated with mineralogy and the plasticity index. Those materials with smectitic minerals and greater plasticity indices retained greater amounts of water and had lower permeabilities than materials with other clays or lower plasticity indices. HYDROLOGY OF THE NAHANNI KARST, NORTHERN CANADA, AND THE IMPORTANCE OF EXTREME SUMMER STORMS,
Georgia Univ., Athens. Dept. of Geography.
G. A. Brook, and D. C. Ford.
Journal of Hydrology, Vol 46, No 1/2, p 103-121, March 1980. 9 Fig, 3 Tab, 8 Ref.

Descriptors: *Karst, *Canada, *Perched water, *Lakes, *Sinks, Groundwater movement, Subsurface drainage, Rhodamine, Tracers, Dyes, Springs, Rainfall, Hydrogeology, Caves, Geologic control, Hydrology, Surface-groundwater relationships, *Poljes, Flow conduits, Estavelles, Cols, Dolines, Ponors.

Discovered in August 1971, the Nahanni karst is the most complex high-latitude karst known. Mean annual temperature is -4.5C and precipitation 566 mm. The most spectacular landforms occur on a structural col (the 'north karst') connecting south Nahanni and Ram Plateau. Between July 19 and 31, 1972, an extreme summer storm deposited 224 mm of rain on the area. First, Second, and Third Poljes in the north karst flooded; maximum water depths were 8.5, 25, and 8 m, respectively, and Third Polje overflowed. The level of Raven Lake (0.25-0.5 km long) rose 49 m at an average 2.9 m per day. Flooding occurs through random perching of water above and below ground where conduits have been heavily alluviated. There is no highly integrated regional groundwater body; water moves along independent or poorly integrated conduits or multiple aquifers. Some depressions are inundated by groundwater entering through estavelles, others when surface and spring inputs exceed drainage. Although winter snowfall averages 213 cm, in most years spring snowmelt does not appear to cause prolonged flooding. However, it raises water levels in the aquifer leaving the area prone to flooding by frequent, intense summer rains. The magnitude and complexity of hydrologic activity in the subarctic Nahanni karst is remarkable, being comparable with that in tropical and temperate carbonate areas. (Visocky-ISWS)

RAINFALL INTERCEPTION IN A FOREST STAND ESTIMATED FROM GRASSLAND METEOROLOGICAL DATA,
Forest Research Inst., Christchurch (New Zealand).
A. J. Pearce, J. H. C. Gash, and J. B. Stewart.
Journal of Hydrology, Vol 46, No 1/2, p 147-163, March 1980. 3 Fig, 4 Tab, 11 Ref.

Descriptors: *Rainfall, *Interception, *Forests, *Model studies, Mathematical models, Meteorological data, Evaporation, Vegetation, Vegetation effects, Trees, Pine trees, Canopy, Precipitation(Atmospheric), Water loss, Meteorology.

Meteorological data collected over grassland were used in the Rutter and analytical interception models to predict interception losses for a Scots pine stand in Thetford Forest during 84 weeks in 1975 and 1976. Rutter and analytical model estimates using grassland data overestimated the observed losses by 37% and 25%, respectively; estimates using data collected over the forest overestimated by 8% and 5%, respectively. Systematic differences in the meteorological parameters controlling the evaporation rate from wet forest and wet grass are the cause of the overestimation of interception losses when grassland data are used in the models. Mean air temperature over the wet forest was 0.75C cooler, mean wet-bulb depression was 0.25C smaller, and mean vapor pressure deficit was 0.4 mbar smaller than the mean values observed over wet grass in 116 hr when more than 0.5 mm of rain fell at both observation sites. No significant differences between sites were found when both the grass and the forest canopy were dry. Regression equations for forest-site parameters on grassed-site parameters were used to adjust the grassed-site data for use in the models. Analytical model estimates using adjusted data were closely comparable to both observed losses and model estimates using above-forest data. Rutter model estimates using adjusted data were significantly different from the observed losses for 1976 and for the combined 1975-1976 data, but were comparable with the observed losses and model estimates using above-forest data in 1975. THE EFFECT OF ALTERED STREAMFLOW ON THE HYDROLOGY AND GEOMORPHOLOGY OF THE YELLOWSTONE RIVER BASIN, MONTANA,
Montana Dept. of Natural Resources and Conservation, Helena.
R. Koch, R. Curry, and M. Weber.
Yellowstone Impact Study, Technical Report No 2, 1977. 173 p, 38 Fig, 23 Tab, 73 Ref, 3 Append.

Descriptors: *Hydrology, *Channel morphology, *Montana, *River basins, *Watersheds(Basins), Rivers, Alluvial channels, Data collections, Streamflow, Flood frequency, Floods, Gaging stations, Sediment discharge, Diversion, Streambeds, Sediments, Discharge(Water), Distribution patterns, Regimen, Networks, Precipitation(Atmospheric), Shape, Meanders, Braiding, *Yellowstone River Basin(MT), Hydraulic geometry.

The impact of water development, in particular of a decrease in discharge, on the morphology and sediment transport of the Yellowstone River was the subject of this report. In the past, water use has increased slowly along the Yellowstone, the major

1

demand being for irrigation. The impact on the bankfull discharge as a result of this type of development has been small. The sediment characteristics in the basin have been recently altered through the construction of Yellowtail Dam, which has decreased the sediment load of the Bighorn River as much as 80%. The levels of depletions considered in this report were small for the bankfull discharge; the relative impact was less for larger flows and greater for lesser flows. The changes in stage resulting from these changes in discharge would also be small, as would changes in width, depth, and velocity. The impact of changes in flow regime on sediment transport would be marked when the effect of this modification on total volume is considered. Perennial streams, particularly those that head in major mountain ranges in Wyoming and Montana, are amenable to predictable hydraulic geometry relationships. However, the small perennial and ephemeral streams in southeastern Montana do not bear the usual relationship between bankfull stage and recurrence interval. Instead of being characterized by a bankfull flow event on the average of once every 1.5 years like the regional perennial streams, the local ephemeral streams achieve that discharge only once every 15 to 25 years, or even less frequently. Additionally, the streams are highly irregular from site to site so that, for example, the ratio between the 25-year peak discharge and the 1.5-year peak discharge on streams of a fixed drainage size varies by a factor of as much as two orders of magnitude between sites separated by but tens of miles. A GENERALIZED PROBABILITY DENSITY FUNCTION FOR DOUBLE-BOUNDED RANDOM PROCESSES,
Institute of Hydraulics and Hydrology, Poondi (India).
P. Kumaraswamy.
Journal of Hydrology, Vol 46, No 1/2, p 79-88, March 1980. 3 Fig, 3 Tab, 5 Ref.

Descriptors: *Probability, *Stochastic processes, *Mathematical models, Rainfall, Runoff, Streamflow, Equations, Model studies, Statistics, Hydrology, Fitting functions, Probability density functions.

The author in 1976 developed the sinepower probability density function (SP-PDF) to fit up random processes which are bounded at the lower and upper ends, and which has a mode occurring between these two bounds. This latter condition is now relaxed, and a generalized PDF entitled double bounded probability density function (DB-PDF) was developed here. Methods for the application to practical problems of parameter estimation and to computer simulation of random variables were explained by a numerical example. (Sims-ISWS)

EFFECT OF SIMULATED ACID RAIN ON SULFATE MOVEMENT IN ACID FOREST SOILS,
Norwegian Forest Research Inst.
B. R. Singh, G. Abrahamsen, and A. Stuanes.
Soil Science Society of America Journal, Vol 44, No 1, p 75-80, January-February 1980. 4 Fig, 3 Tab, 31 Ref.

Descriptors: *Acidic water, *Soils, *Forest soils, Laboratory tests, Lysimeters, Acids, Acidity, Hydrogen ion concentration, Sulfates, Cations, Leaching, Chemicals, Vegetation effects, Soil science, Acid precipitation.

The effect of simulated acid rain on sulfate mobility in iron-podzol and semipodzol (Typic Udipsamments) forest soils of southern Norway was studied. The study was carried out with lysimeters with undisturbed soil. The lysimeters were watered with 'rain' having pH 5.6 and 4.3. It was found that sulfate mobility was higher in the semipodzol than in the iron-podzol, and it was dependent on their sulfate adsorption capacities which in their turn were dependent on A1 contents of these soils. Sulfate losses from applied 35S increased with increasing volume and decreasing pH of the 'rain'. The element losses were also higher in the semipodzol reflecting further higher mobility of sulfate in this soil. The total sums of cations, on equivalent basis, in the leachate from the semipodzol were nearly equal at pH 5.6 and 4.3 (0.480 and 0.485 meq/liter, respectively). In the iron-podzol, however, total sums of cations at pH 5.6 and 4.3 differed slightly (0.314 and 0.387 meq/liter, respectively). (Sims-ISWS)

GLACIER SURVEYS IN ALBERTA - 1977,
Inland Waters Directorate, Ottawa (Ontario).
I. A. Reid, and J. O. G. Charbonneau.
Report Series No 65, 1979, 17 p, 8 Fig, 19 Tab, 9 Ref, 2 Map.

Descriptors: *Athabasca Glacier, *Glaciers, *Hydrology, *Photogrammetry, *Mapping, *Aerial change, *Directional change, *Data collections, Saskatchewan, Canada.

Glaciers act as natural regulators, storing water in winter and releasing it in summer. To gain some understanding of this phenomenon and the contribution which glaciers make to streamflow, the predecessors of the Water Survey of Canada began glacier surveys in 1945. The earlier surveys offered some clue to the role of the glacier, but the data collected were not sufficient to provide the overall picture. Following adoption of photogrammetric survey techniques, however, the glacier surveys have evolved to the extent that it is now feasible to produce a series of maps from which the linear, areal, directional and volumetric changes can be determined. The surveys have revealed that the glaciers, in general, are becoming smaller in size; hence the regulating effect on streamflow is diminishing. (WATDOC)

THE ACTIVE AND PASSIVE MICROWAVE RESPONSE TO SNOW PARAMETERS, 1. WETNESS,
Kansas Univ./Center for Research, Inc., Lawrence. Remote Sensing Lab.
W. H. Stiles, and F. T. Ulaby.
Journal of Geophysical Research, Vol 85, No C2, p 1037-1044, February 20, 1980. 12 Fig, 3 Tab, 7 Ref. NASA/GSFC NAS 5-23777.

Descriptors: *Snow, *Moisture content, *Remote sensing, Radar, Microwaves, Variability, Diurnal, Equipment, Electronic equipment, Instrumentation, Snowpacks, Snow surveys, Water resources, Electrical engineering.

Diurnal observations of the variation of the radar backscattering coefficient, sigma o, and microwave apparent radiometric temperature, T sub ap, with snow wetness, m sub v, were presented. The results showed that sigma o decreases and T sub ap increases with m sub v, and that the magnitude of the sensitivity to m sub v increases with microwave frequency for both active and passive microwave parameters. Moreover, while the sensitivity of sigma o to snow wetness variations increases with angle of incidence, the sensitivity of T sub ap to snow wetness is approximately angle of incidence independent. W80-04624

THE ACTIVE AND PASSIVE MICROWAVE RESPONSE TO SNOW PARAMETERS, 2. WATER EQUIVALENT OF DRY SNOW,
Kansas Univ./Center for Research, Inc., Lawrence. Remote Sensing Lab.
F. T. Ulaby, and W. H. Stiles.
Journal of Geophysical Research, Vol 85, No C2, p 1045-1049, February 20, 1980. 5 Fig, 2 Tab, 8 Ref. NASA/GSFC NAS 5-23777.

Descriptors: *Snow, *Moisture content, *Remote sensing, Radar, Microwaves, Mathematical models, Equipment, Electronic equipment, Instrumentation, Snowpacks, Snow surveys, Water resources, Electrical engineering.

Experimental measurements of the variation of the radar backscattering coefficient, sigma o, and microwave emissivity, epsilon, with water equivalent, W, of dry snow were presented and compared to predictions of simple semiempirical scattering and emission models. The results showed that sigma o and epsilon are generally dependent on the snowpack water equivalent as well as contributions by the underlying soil, and that the variation with W is a function of frequency and angle of incidence. LONG-PERIOD GRAVITY WAVES IN ICE-COVERED SEA,
Alaska Univ., Fairbanks. Geophysical Inst.
H. F. Bates, and L. H. Shapiro.
Journal of Geophysical Research, Vol 85, No C2, p 1095-1100, February 20, 1980. 1 Tab, 18 Ref, 1 Append. NOAA 03-5-022-55, NSF DPP78-01806.

Descriptors: *Gravity waves, *Ice cover, *Sea ice, *Model studies, Mathematical models, Cold regions, Oceans, Waves(Water), Theoretical analysis, Analytical techniques, Oceanography.

A floating ice sheet under compressive stress was modeled as a laterally compressed thin linearly elastic plate, floating on a compressible liquid of constant depth over a rigid bottom. This system was analyzed as a wave guide for plane waves. Sinusoidal traveling waves having vertical planes of constant phase were sought for the impulse response of the system. Two bands of gravity waves were found: (1) flexural and (2) floating-membrane. The two bands join at the critical frequency of the system, at which the impulse response is unbounded. The long-period floating-membrane gravity waves exist at all frequencies below the flexural gravity wave band. For long-period gravity waves the coupling force between plate and liquid was found to be a Hooke's Law force; the effective foundation modulus was directly proportional to the difference between the square of the phase velocity of a wave in the floating-plate system and that of a free-surface gravity wave at the same wavelength. The analogy of an elastic plate supported on an elastic foundation is apt for these long-period waves. It was concluded that the impulsive release of stored elastic energy when the compressed ice breaks supplies adequate energy to produce measurable long-period waves in floating ice. The results suggest

that long-period wave motion accompanies lateral compression of the ice sheet; hence wave measurements may provide a means of detecting the buildup of widespread compressive stress in the ice. (Sims-ISWS)

PERMITTIVITY OF ICE AND WATER AT MILLIMETER WAVELENGTHS,
Georgia Inst. of Tech., Atlanta.
M. D. Blue.
Journal of Geophysical Research, Vol 85, No C2, p 1101-1106, February 20, 1980. 4 Fig, 2 Tab, 7 Ref, 1 Append. NASA NSG-5082.

Descriptors: *Ice, *Water, *Electrical properties, *Microwaves, Refractivity, Reflectance, Measurement, Laboratory tests, Analytical techniques, Temperature, Model studies, Mathematical models, Permittivity, Dielectric properties.

Measurements of reflectivity of water and ice at 100 GHz, 140 GHz, and 180 GHz were reported. Measurements on water covered the temperature range 0C to 50C. No anomalies in the dielectric properties of water due to the presence of either salts or organic matter were found. The reflectivity of water and its temperature dependence were consistent with recent dielectric property models derived from data at other wavelengths. The index of refraction of fresh ice was constant at 1.78 throughout this region. (Sims-ISWS)

CRYSTAL ALIGNMENTS IN THE FAST ICE OF ARCTIC ALASKA,
Cold Regions Research and Engineering Lab., Hanover, NH.
W. F. Weeks, and A. J. Gow.
Journal of Geophysical Research, Vol 85, No C2, p 1137-1146, February 20, 1980. 10 Fig, 1 Tab, 8 Ref, 1 Append.

Descriptors: *Ice, *Sea ice, *Ice cover, *Crystals, *Alaska, *Arctic Ocean, On-site investigations, On-site collections, Sampling, Currents(Water), Ocean currents, Continental shelf, Cold regions, Crystal alignments, Fast ice.

Field observations at 60 sites located in the fast or near-fast ice along a 1200-km stretch of the north coast of Alaska between the Bering Strait and Barter Island have shown that the great majority of the ice samples (95%) exhibit striking c axis alignments within the horizontal plane. In all cases the degree of preferred orientation increased with depth in the ice. Representative standard deviations around a mean direction in the horizontal plane were commonly less than + or - 10 deg for samples collected near the bottom of the ice. At a given site the mean c axis direction may vary as much as 20 deg with vertical location in the ice sheet. The c axis alignments in the nearshore region generally paralleled the coast, with strong alignments occurring in the lagoon systems between the barrier islands and the coast and seaward of the barrier islands. In passes between islands and in entrances such as the opening to Kotzebue Sound the alignment was parallel to the channel. Only limited observations were available farther seaward over the inner (10- to 50-m isobaths) and outer (50-m isobath to shelf break) shelf regions. These indicated NE-SW and E-W alignments, respectively, in the Beaufort Sea north of Prudhoe Bay. (Sims-ISWS)

Science and Education Administration, Mandan, ND. Northern Great Plains Research Center.
G. A. Reichman, E. J. Doering, L. C. Benz, and R. F. Follett.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 6, p 1343-1346, 1352, November-December 1979. 5 Fig, 1 Tab, 10 Ref.

Descriptors: *Lysimeters, *Evapotranspiration, *On-site investigations, *Irrigation effects, *Crop response, Infiltrometers, Soil water movement, Evaporation, Transpiration, Drainage systems, Measurement, Great Plains, Corn(Field).

The construction of 12 large, nonweighing lysimeters with automatic water table controls was described. Three distinct layers of the Hecla loamy fine sand profile were used to reconstruct the natural soil profile in the lysimeters. The controls are automatically operated with time clocks and float switches to maintain selected water table levels. The system is capable of replacing evapotranspiration losses of up to 2 cm every 24 h and of removing excess profile water of up to 4 cm per 24-h period. The performance of the system with respect to changes in water table elevation due to different precipitation and air temperatures was shown. The system has functioned satisfactorily for 4 yr with minimum attention and maintenance. (Adams-ISWS)

STOCHASTIC SYNTHESIS OF HYDROLOGIC DATA BASED ON CONCEPTS OF PATTERN RECOGNITION, I. GENERAL METHODOLOGY OF THE APPROACH,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
U. S. Panu, and T. E. Unny.
Journal of Hydrology, Vol 46, No 1/2, p 5-34, March 1980. 9 Fig, 1 Tab, 45 Ref.

Descriptors: *Streamflow, *Discharge(Water), *Model studies, Mathematical models, Data processing, Statistics, Synthesis, Synthetic hydrology, Stochastic processes, Time series analysis, Rivers, Streams, Hydrology, Pattern recognition.

In stochastic models for streamflow synthesis no consideration is given to the presence of groups of data corresponding to wet and dry periods. The existence of such groups in geophysical records including hydrologic records was well emphasized by Hurst. This paper is the first in a series of three, which develops a feature synthesis model for hydrologic records utilizing properties assignable to groups and the concepts of pattern recognition. Part II will discuss the application of the model to natural streamflow records, and Part III will demonstrate the efficacy of the proposed model through testing the synthesized streamflows from the viewpoints of various statistical and hydrological tests. WELSH FLOODPLAIN STUDIES, II. APPLICATION OF A QUALITATIVE INUNDATION MODEL,
University Coll. of Wales, Aberystwyth.
J. Lewin, and D. Hughes.
Journal of Hydrology, Vol 46, No 1/2, p 35-49, March 1980. 5 Fig, 4 Tab, 11 Ref.

Descriptors: *Floods, *Flood plains, *Rivers, *Model studies, Mathematical models, Flow, Streamflow, Water levels, Watersheds(Basins), Drainage, Topography, Hydrology, *Wales, *Dyfi River(Wales), *Teifi River(Wales).

The relationship of inundating waters to patterns of floodplain relief was assessed in terms of an inundation model involving types of input, output, and transfer processes. This model was applied to floods observed in the rivers Dyfi and Teifi in mid-Wales from 1973-1977. These showed complex patterns of actual inundation sequences, involving hysteretic effects in the relationship between river stage and flood extent, and varying effects arising from human floodplain modifications, different rates of stage fluctuation, and the local incidence of floodplain forms. Further sequential studies of inundation for contrasted floodplain types should allow better understanding of floodplain conductivity as an aid to flood-routing procedures and as a help in understanding discharge-inundation relationships. DEBRIS FLOW ON PRISMATIC OPEN CHANNEL,
Kyoto Univ. (Japan). Disaster Prevention Research Inst.
T. Takahashi.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY3, Proceedings Paper 15245, p 381-396, March 1980. 9 Fig, 19 Ref, 2 Append.

Descriptors: *Open channel flow, *Debris avalanches, *Sediment transport, Boulders, Clays, Flocculation, Mudflows, Profiles, Sediments, Velocity, Viscosity, Hydraulics, Slurries, Resistance, *Debris removal, Granular media, Segregation, Prismatic channel.

Reviews on the yield strength and viscosity of the interstitial clay slurry in debris flow prove that ordinary debris flow may be modeled as a dilatant fluid in which the intergranular forces dominate. Theoretical velocity distributions in dilatant fluid compare well with the experimental results when the value of a numerical constant is appropriately selected. The longitudinal profile of the lobate snout is satisfactorily analyzed by applying the theory of one-dimensional translation wave on an open channel, where the resistance coefficient is a function of concentration, depth, and grain diameter. A remarkable segregation of particles, in which the larger ones move upwards, occurs in debris flow due to the effects of collisions of particles. The accumulation of boulders in the front part of debris flow is a result of the faster transportation of the larger particles in the upper layer of the flow than that of the smaller ones in the lower layer. (Lee-ISWS)

THE DESIGN OF A FLOOD FORECASTING PROCEDURE FOR THE KLANG RIVER AT KUALA LUMPUR,
Lincoln Coll. (New Zealand).
V. J. Bidwell.

Journal of Hydrology (New Zealand), Vol 18, No 1, p 29-35, 1979. 2 Fig, 1 Tab, 2 Ref.

Descriptors: *Flood forecasting, *Water levels, *Mathematical models, *Asia, Model studies, Rivers, Streamflow, Floods, Flood flow, Watersheds(Basins), Precipitation(Atmospheric), Rainfall, Precipitation excess, Hydrology, *Malaysia, *Klang River(Malaysia).

A procedure was required for forecasting the flood level of the Klang River at the city of Kuala Lumpur, Malaysia. Using data from rainfall stations and tributary river stages, one may predict flood stage by means of a multiple-input, autoregressive, moving-average linear model. This model was calibrated from storm records by means of stepwise multiple regression. The resulting set of equations was developed into a procedure for manual computation. (Sims-ISWS)

FLOODS IN GEORGIA, MAGNITUDE AND FREQUENCY,
Geological Survey, Doraville, VA. Water Resources Div.
M. Price.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-146244, Price code: A13 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-137, October 1979. 269 p, 29 Fig, 6 Tab, 24 Ref.

Descriptors: *Floods, *Peak discharge, *Flood frequency, *Georgia, *Flood forecasting, Analytical techniques, Estimating, Flood recurrence interval, Gaging stations, Flood data, Rainfall-runoff relationships, Natural streams, Drainage area, River basins, Regression analysis, Model studies.

Regional relations are defined for estimating the magnitude and frequency of floods having recurrence intervals of 2, 5, 10, 25, 50, and 100 years on streams with natural flow in Georgia. Multiple-regression analyses were used to define the relationship between the flood-discharge frequency of annual peak discharges for streams draining 0.1 to 1,000 square miles and 10 climatological and physical basin characteristics. The analyses indicate that the drainage area of the basin is the most significant characteristic. Five regions having distinct flood-discharge frequency characteristics are delineated. Individual relations of flood magnitude and frequency to drainage area are given for parts of the main stems of the major rivers without significant regulation draining more than 1,000 square miles. STATISTICAL SUMMARY OF STREAMFLOW DATA FOR KANSAS STREAMS IN THE MISSOURI RIVER BASIN,
Geological Survey, Lawrence, KS. Water Resources Div.
P. R. Jordan.
Kansas Water Resources Board, Streamflow Characteristics Technical Report No 14B, September 1979. 334 p, 14 Fig, 1 Tab, 2 Ref.

Descriptors: *Streamflow, *Flow duration, *Low flow, *High flow, *Kansas, Streams, Flow rates, Average flow, Gaging stations, Drainage area, Natural flow, Regulated flow, Basic data collections, *Missouri River basin(Kans).

Tables summarizing streamflow data are presented for each gaging station in the Missouri River basin in Kansas that had at least 1 year of record through 1976. These tables summarize daily streamflow as follows: (1) the number of days in each year that the daily discharge was between selected limits (duration tables), (2) the lowest mean discharge for selected numbers of consecutive days in each year, (3) the highest mean discharge for selected numbers of consecutive days in each year, and (4) for stations having at least 20 years of record, the percentage of days in each month when the discharge equaled or exceeded selected class limits (monthly duration tables). These summaries provide useful information for appraising and comparing the hydrologic characteristics of drainage basins, for classifications of streams for regulatory purposes, and for design of water-supply reservoirs and flood-control works. HYDROLOGIC AND HUMAN ASPECTS OF THE 1976-77 DROUGHT,
Geological Survey, Menlo Park, CA. Water Resources Div.
H. F. Matthai.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $4.25. Geological Survey Professional Paper 1130, 1979. 84 p, 30 Fig, 52 Ref.

Descriptors: *Hydrologic budget, *Droughts, *United States, *Groundwater, *Low flow, Withdrawal, Reservoir storage, Water shortage, Precipitation(Atmospheric), Water conservation, Water quality, Surface waters, Rationing(Water), Rural areas, Legal aspects, Land subsidence, Water management(Applied).

The drought of 1976-77 was the most severe in at least 50 years in many parts of the United States. Record low amounts of rainfall, snowfall, and runoff, and increased withdrawals of ground water were prevalent. The use of carry-over storage in reservoirs during 1976 maintained streamflow at near normal levels, but some reservoirs went dry or dropped below the outlet works in 1977. Carry-over storage in the fall of 1977 was very low. Ground-water levels were at or near record low levels in many aquifers, hundreds of wells went dry, and thousands of wells were drilled. Yet no wide-spread deterioration of ground-water quality was reported. Water-quality problems arose in some streams and lakes, but most were localized and of short duration. Water rationing became a way of life in numerous areas, and water was hauled in many rural areas and to a few towns. Water use was affected by legal agreements or decisions, some of which were modified for the duration of the drought, and by the inability of water managers to efficiently manage surface and ground waters as one resource under existing law. There are still many drought related problems to solve and many challenges to be met before the next drought occurs. The advancement of techniques in many fields of endeavor in recent years plus ongoing, planned, and proposed research on drought and the risks involved are promising thrusts that should make it easier to cope with the next drought. MAINE COASTAL STORM AND FLOOD OF FEBRUARY 2, 1976,
Geological Survey, Augusta, ME. Water Resources Div.
R. A. Morrill, E. H. Chin, and W. S. Richardson.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.00. Geological Survey Professional Paper 1087, 1979. 20 p, 10 Fig, 2 Plates, 5 Tab, 7 Ref.

Descriptors: *Maine, *Coasts, Storm surge, *Floods, *Tidal waters, High water mark, *Wind tides, Estuaries, Flood damage, New England, Documentation, Meteorological data, Hydrologic data, Drainage area, Streamflow, Sites, Maps, Currents(Water), Gaging stations, *Bangor area(Maine).

A business section of Bangor, Maine, was flooded with 12 feet (3.7 m) of water on February 2, 1976. The water surface elevation reached 17.46 feet (5.32 m) above national geodetic vertical datum of 1929 (NGVD), approximately 10.5 feet (3.2 m) above the predicted astronomical tide at Bangor. The unusually high water resulted from a tidal storm surge caused by prolonged strong, south-southeasterly winds which occurred near the time of astronomical high tide. Winds exceeded 64 knots off the New England coast. The resulting flood was the third highest since 1846 and is the first documented tidal flood at Bangor. This report documents the meteorological and hydrologic conditions associated with the flooding and also contains a brief description of storm damage from Eastport to Brunswick, Maine. Included are flood elevations in the city of Bangor and along the coast of Maine east of the Kennebec River. (Kosco-USGS)

TECHNIQUES FOR ESTIMATING MAGNITUDE AND FREQUENCY OF FLOODS ON RURAL UNREGULATED STREAMS IN NEW YORK STATE, EXCLUDING LONG ISLAND,
Geological Survey, Albany, NY. Water Resources Div.
T. J. Zembrzuski, Jr., and B. Dunn.
Geological Survey Water-Resources Investigations 79-83 (open-file report), 1979. 66 p, 5 Fig, 7 Tab, 24 Ref, 3 Append.

Descriptors: *Flood forecasting, *Peak discharge, *Floods, *Flood frequency, *New York, Streams, Analytical techniques, Flood recurrence interval, Regional analysis, Gaging stations, Regression analysis, Equations, Estimating, Drainage area, Precipitation(Atmospheric), *Log-Pearson type III statistics.

Techniques are presented for estimating the magnitude and frequency of floods at ungaged sites on unregulated rural streams in New York, excluding Long Island. The discharge-frequency data and basin characteristics of 220 stream-gaging stations in New York and adjacent States were used in developing multiple linear regression equations for floods ranging in recurrence interval from 2 to 100 years. Separate equations were developed for northern, southeastern, and western New York. Standard errors of estimate of the 100-year flood range from 32.9 percent in the southeastern region to 42.8 percent in the western region. Drainage area is the independent variable needed in all equations; other variables needed, depending on region, are main-channel slope, storage index, and mean annual precipitation. A method is given for obtaining improved discharge-frequency relationships at gaged sites by weighting log-Pearson type III and regression estimates according to their variances. Basin characteristics, log-Pearson type III statistics, and regression and weighted estimates of the frequency-discharge relationship, are tabulated for the gaging stations used in the regression analyses. (Kosco-USGS)

FLOOD HAZARD STUDY TALLASSEEHATCHEE CREEK AND TRIBUTARIES IN VICINITY OF JACKSONVILLE, ALABAMA.
Soil Conservation Service, Auburn, AL.
Report No ALA-OSPFP 100902, March 1980. p 64, 21 Fig, 6 Tab, 9 Ref, 3 Append. HUD P-1009.

Descriptors: *Alabama, *Flood profiles, *Flood data, *Flood plain zoning, Land use, Floodways, Flood data, Flood frequency, Topography, Water levels, Overflow, Streamflow, Floods, Flood damage.

Local flood problems and hazards are identified for the city of Jacksonville, Alabama, to serve as guidelines for local governments in the reduction of potential flood losses caused by unwise development in flood-prone areas. The area involved in the study includes 8 stream miles and drainage areas ranging from 0.7 to 9.5 sq mi for Tallasseehatchee Creek, 9.8 to 17.8 sq mi for Little Tallasseehatchee Creek, and 0.8 to 4.2 sq mi for the tributaries. The area has a humid and temperate climate with a yearly rainfall average of 53.24 in, generally well distributed throughout the year. Land use in the area includes cropland, pasture, woodland, residential, commercial, industrial, and roads. Rapid urbanization is producing increasing pressure for flood plain development. Reliable information on the flood history of the area is not available. Included in the report are Flood Hazard Area Photomaps, Flood Profiles, Discharge-Elevation-Frequency Data, and Floodway Data for streams. Regulatory and corrective measures to minimize the risk of flooding are discussed along with pertinent existing State and local flood-prone area regulations. With present conditions a 100-year flood would damage approximately 484 acres while a 500-year flood would damage approximately 560 acres. Projected urban growth along the streams studied is expected to cause significant change in flood levels along the main streams. (Seigler-IPA)

STOCHASTIC SYNTHESIS OF HYDROLOGIC DATA BASED ON CONCEPTS OF PATTERN RECOGNITION, III. PERFORMANCE EVALUATION OF THE METHODOLOGY,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
U. S. Panu, and T. E. Unny.
Journal of Hydrology, Vol 46, No 3/4, p 219-237, April 1980. 4 Fig, 7 Tab, 6 Ref.

Descriptors: *Streamflow, *Synthetic hydrology, *Statistics, *Model studies, Mathematical models, Evaluation, Water levels, Flow, River flow, Analytical techniques, Methodology, Hydrology, Statistical methods, Pattern recognition.

Synthetic realizations of monthly streamflows obtained by utilizing a feature synthesis model were tested from statistical and hydrological viewpoints. In terms of statistical considerations the synthetic realizations were shown to possess relevant properties of the historical streamflows at the series level as well as at the monthly level. From hydrological considerations, the synthetic realizations were found to be embedded in properties that are associated with clusters of low flows and clusters of peak flows that are comparable to those in the historical sample. The model results suggested that the synthesis of streamflows based on concepts of pattern recognition is a potentially viable approach and warrants further investigation. A PRACTICAL MODEL FOR LINEAR AND NONLINEAR RUNOFF,
Nebraska Univ. at Omaha. Dept. of Civil Engineering.
W. F. Rogers.
Journal of Hydrology, Vol 46, No 1/2, p 51-78, March 1980. 8 Fig, 3 Tab, 10 Ref.

Descriptors: *Runoff, *Peak discharge, *Model studies, Mathematical models, Discharge(Water), Drainage, Base flow, Rainfall, Watersheds(Basins), Storms, Storm runoff, Hydrographs, Hydrology.

Second-order standardized peak discharge distribution was defined as the log of peak discharge divided by runoff volume in inches squared regressed on log runoff volume in inches. The slope of this distribution is -1.0 for linear basins and less than -1.0 for nonlinear drainage basins. High r sq-values indicate runoff volume alone accounts for an average of 86% of the variation in the dependent variable. Because most drainage basins exhibit nonlinear second-order peak dischage distribution, this model is useful in predicting peak discharges for rainfall and runoff events of any duration, spatial distribution, or uniformity; and no separation of base flow is necessary. The effect of any antecedent moisture condition appears to be evaluated. The regression slope of this peak discharge distribution model is a drainage basin characteristic. Basins with similar slopes should be homogeneous. (Sims-ISWS)

General formulation of adaptive parameter and state estimations was fully developed on the basis of Kalman filters, given a periodic-stochastic model coupled with an observation model. It was successfully applied to decompose a given monthly flow sequence into periodic and stochastic components. The results showed a definite advantage of using adaptive Fourier analysis over conventional analysis. (Sims-ISWS)

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY4, Proceedings Paper 15347, p 575-587, April 1980. 5 Fig, 2 Tab, 10 Ref, 2 Append. NSF ENG 76-02896.

Descriptors: *Open channel flow, *Turbulence, *Model studies, *Flow characteristics, Turbulent flow, Mathematical models, Dispersion, Diffusion, Theoretical analysis, Analytical techniques, Steady flow, Statistical methods, Laboratory tests, Velocity, Fluctuations, Measurement, Instrumentation, Anemometers, Hydraulics, Probability, Rough boundary, Smooth boundary.

An analytical model for predicting turbulent intensities of velocity for the streamwise and cross-streamwise directions in open channel flow was derived. Due to the random nature of turbulence, a probabilistic approach to the problem is required. A Gaussian distribution was assumed to describe the turbulent fluctuating velocities. From this basic condition, a three-parameter model was derived to predict the root-mean-square (rms) values of turbulence for the vertical and longitudinal directions. Values calculated from the mathematical model were compared to experimentally obtained data using hot-film anemometry techniques, and excellent agreement existed for both components of rms. Field data should be tested to provide a more definite evaluation of the universality of the model. (Humphreys-ISWS)

THE RIVER LAXA ECOSYSTEM, ICELAND,
Copenhagen Univ., Hillerod (Denmark). Freshwater-biological Lab.
P. M. Jonasson.
Oikos, Vol 32, No 1-2, p 306-309, 1979. 2 Fig, 1 Tab, 10 Ref.

Descriptors: *River Laxa(Iceland), *Ecosystems, *Gradients(Streams), *Rivers, Lake Myvatn(Iceland), *Ecological distribution, Spawning, *Powerplants, Fluvial sediments, Upstream, Surface waters, Watersheds(Basins), Fish stocking, River flow, Profiles, Slopes, Zoobenthos, Salmon, Trout, Streams, Iceland, Chironomids, Oligochaetes.

The River Laxa, Iceland, originates in Lake Myvatn and flows into the Atlantic Ocean. It is 58 km long and flows through two different topographic areas: the upper steep part, where the river flows rapidly and where sedimentation does not occur; and the lower part where the slope is gentle, the river flow is slower and sedimentation occurs. A powerplant is located at the juncture of these two stretches. Transport of organic material produced in Lake Myvatn amounts to an average 600 kg dry weight/sec. Downstream movement of organic matter declines rapidly from 3.68 mg dry weight/l near the lake to 2.56 mg dry weight/l about halfway down the river to 1.15 mg dry weight/l near the entry into the ocean. A sharp reduction in chlorophyll occurs in the upper river. The upper river is abundant in Simuliidae, Hydra, Plumatells, chironomids and oligochaetes. Quantitative measures of zoobenthos were not made. However, high concentrations of ducks and trout feeding on zoobenthos in the uppermost reaches of the river indicate that zoobenthos is abundant

there. The lower river is an outstanding salmon river with the highest average catch of 2,200 individuals/year, and the highest average weight of 5.0 kg for Salmo salar L. in Iceland. Since the salmon cannot pass the canyon at the power plant and reach the upper river, the upper reaches have trout, Salmo trutta L. instead. The experimental release of salmon parr in the upper river proved successful, probably because the lava blocks forming the river bed at those locations are a favorable salmon habitat. AQUIFER COEFFICIENTS DETERMINED FROM MULTIPLE WELL EFFECTS, FERNANDINA BEACH, FLORIDA,
Geological Survey, Jacksonville, FL. Water Resources Div.
C. B. Bentley.
Ground Water, Vol 17, No 6, p 525-531, November-December 1979. 6 Fig, 3 Tab, 4 Ref.

Descriptors: *Aquifer characteristics, *Artesian wells, *Florida, *Water level fluctuations, Pumping, Observation wells, Confined water, Groundwater, Drawdown, Transmissivity, Storage coefficient, Groundwater recharge.

On September 30, 1977, a large industrial plant in Fernandina Beach, Florida, shut down six artesian wells that had been pumping continuously for several weeks from the Floridan aquifer. Two wells continued pumping until November 20, 1977, at which time the shutdown wells were restarted. A water-level recorder on an observation well recorded the changing water level following shutdown and startup. Pumping rates of the wells ranged from 400,000 to 590,000 cubic feet per day. Distances from the pumped wells to the observation well range from 660 to 7,920 feet. Analysis of the water-level data was complicated because the wells were neither turned off nor restarted simultaneously; during recovery one well was restarted and pumped for several hours; and at the beginning of startup, a well that had been pumping continuously during the shutdown was turned off. The Cooper-Jacob graphical method, based on the principle of superposition and using values of specific drawdown or specific recovery and weighted logarithmic mean of the distance squared divided by time was applied to determine the aquifer coefficients for the upper water-bearing zone of the aquifer. A transmissivity of 30,000 feet squared per day and a storage coefficient of between 0.00025 and 0.0004 were computed. (Kosco-USGS)

HYDROLOGY AND SURFACE MORPHOLOGY OF THE BONNEVILLE SALT FLATS AND PILOT VALLEY PLAYA, UTAH,
Geological Survey, Salt Lake City, UT. Water Resources Div.
G. C. Lines.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $3.50. Geological Survey Water-Supply Paper 2057, 1979. 107 p, 47 Fig, 7 Tab, 39 Ref.

Descriptors: *Hydrology, *Lake morphology, *Great Salt Lake, *Utah, *Playas, Deserts, Topography, Salinity, Hydrologic budget, Climatology, Groundwater, Aquifer characteristics, Brines, Potash, Mud flats, Groundwater recharge, Discharge(Water), Water chemistry, Evaporation, *Bonneville Salt Flats(Utah), *Pilot Valley(Utah).

The salt crust on the Bonneville Salt Flats, Utah, has been used for many years for racing and for the production of potash. There is a conflict between users, as the salt crust has diminished in size. Brine in the shallow sediments is drained into ditches adjacent to the Bonneville Racetrack, and the brine is used to produce potash. Because brine is extracted from leased Federal and State lands and from privately owned land, there is also concern as to whether minerals were being extracted from unleased Federal and State lands. A hydrologic study indicates that the Bonneville salt crust is being affected by a number of factors including (1) natural climatic cycles, (2) extraction of brine from the ditches, and (3) manmade surface-drainage barriers (tailings piles along ditches and highway roadfills) and ponding areas where sediment is accumulating on the surface of the salt crust. Remedial measures that are evaluated include (1) construction of subsurface barriers, (2) construction of new and alteration of old surface-drainage barriers, (3) cease brine withdrawals in areas near the Bonneville salt crust and move ditch systems further from the salt-crust area, and (4) replace the salt removed by the brine-collection ditches with salt stored in the evaporation ponds used to produce the potash, or with salt from some other source. HYDROGEOLOGIC AND GEOCHEMICAL INVESTIGATION OF THE BOONE-ST. JOE LIMESTONE AQUIFER IN BENTON COUNTY, ARKANSAS,
Arkansas Univ., Fayetteville. Dept. of Geology.
A. E. Ogden.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-175177, Price codes: A09 in paper copy, A01 in microfiche. Arkansas Water Resources Research Center University of Arkansas Publication No 68, 1980. p 143, 36 Fig, 5 Tab, 69 Ref, 3 Append, 2 Maps. OWRT A-044-ARK(1).

Descriptors: *Arkansas, *Aquifer characteristics, *Hydrogeology, *Groundwater, Water quality, Well data, Limestones, Permeability, Specific capacity, Transmissivity, Karst hydrology, Caves, Groundwater recharge, Water pollution, Water table aquifers.

Results from thirty-nine pumping tests and well samples were used to study the hydrogeology and hydrochemistry of an important shallow, surface exposed aquifer in northwest Arkansas, the Boone-St. Joe limestone aquifer. The aquifer has two formations, the upper Boone Limestone, and the lower St. Joe Limestone. Parameters determined by the pumping tests include permeability, coefficient of transmissibility, and specific capacity. Coefficient of transmissibility results varied from 24.8 to 24,640 gpd/ft and specific capacity ranged from 0.03 to 30 gpm/ft showing a large range in production capability. Results also indicate that choosing well sites along photo-lineaments is not as reliable for the Boone-St. Joe aquifer as for other karstified carbonate aquifers. Six classes of aquifer conditions were identified for the Boone-St. Joe: (1) wells intersecting caves with rapid recharge; (2) wells intersecting caves with slow recharge; (3) aquifer permeability charges within the saturated zone; (4) delayed yield or leaky conditions; (5) wells intersecting recharge boundaries; and (6) wells in homogeneous aquifer conditions. Groundwater from the aquifer is poor showing high fecal streptococcus counts and high levels of nitrates, chloride, phosphate and sulfate. (Seigler-IPA)

A FINITE-ELEMENT MODEL FOR CONCURRENT CONFINED-UNCONFINED ZONES IN AN AQUIFER,
Indian Inst. of Tech. Madras. Hydraulic Engineering Lab.
K. Elango, and K. Swaminathan.
Journal of Hydrology, Vol 46, No 3/4, p 289-299, April 1980. 10 Fig, 2 Tab, 7 Ref, 1 Append.

Descriptors: *Finite element analysis, *Aquifers, *Confined water, *Groundwater, Mathematical models, Steady flow, Dupuit-Forchheimer theory, Anisotropy, Heterogeneity, Equations, Permeability, Saturated flow, Galerkin technique.

The numerical simulation of the situation of concurrent confined and unconfined zones in a groundwater aquifer system was carried out by using the finite-element method with four-sided mixed-curved isoparametric elements. The model was limited to the steady state and was based on Dupuit's assumptions. The results of the model for a test situation indicated that the model can be used for prediction of the occurrence of unconfined regions around over-pumped wells in an originally confined aquifer of which the interfaces between the confined and unconfined regions may be estimated. THE INTERPRETATION OF TRITIUM IN THE CHALK UNSATURATED ZONE,
Institute of Geological Sciences, London (England). Dept. of Hydrogeology.
S. S. D. Foster, and A. Smith-Carington.
Journal of Hydrology, Vol 46, No 3/4, p 343-364, April 1980. 8 Fig, 4 Tab, 20 Ref.

Descriptors: *Tritium, *Limestones, *Unsaturated flow, *Fallout, Nuclear explosions, Rainfall, Sampling, Groundwater movement, Soil profiles, Pore water, Solutes, Depth, Porosity, Boreholes, Soil moisture, Moisture content, *Chalk aquifer, *England.

Pore-water tritium profiles from the Chalk unsaturated zone were presented, and the problems and limitations in their interpretation were evaluated in detail. A new model of the physicochemical behavior of tritium in the soil zone was proposed, which can account for the quantity and distribution of thermonuclear tritium observed at shallow depths in the unconfined Chalk aquifer. The mechanisms of solute movement through the Chalk unsaturated zone were also discussed. (Visocky-ISWS)

EFFECT OF CLIMATE AND TEMPERATURE ON THE AMOUNT OF HC03(-) AND H2C03 OF GROUNDWATERS (INFLUENCE DU CLIMAT, DE LA TEMPERATURE SUR LA TENEUR EN HC03(-) ET H2C03 DES EAUX SOUTERRAINES),
H. J. Schoeller.
Journal of Hydrology, Vol 46, No 3/4, p 365-376, April 1980. 2 Fig, 17 Ref.

Descriptors: *Groundwater, *Water quality, *Aquifers, *Model studies, Mathematical models, *Analysis, Analytical techniques, Aquifer characteristics, Temperature, Evapotranspiration, Ions, Calcium, Carbonates, Bicarbonates, Hydrogeology, Limestones, Saturated soils, Arid climates, Climates, Humid climates, Cold regions, Unsaturated soils.

An equation was developed that demonstrates the influence of P sub C02, Ca(2+), T, ionic strength, and complex ions on the amount of HC03(-) in

groundwater. Other constraints are the rate of C02 generation in the soil zone, its behavior in the unsaturated and saturated zones, and the hydrodynamic characteristics of the aquifer. In a limestone aquifer in humid regions, HC03(-) water increases slightly toward the areas of warmer temperatures, and also within the same region the HC03(-) decreases as the altitude increases. The HC03(-) concentration in a dolomitic terrane may be lower than that found in a limestone aquifer in a cold region. In arid climates the mineral content of the water increases which results in higher ionic strengh and HC03(-) concentration due to the rapid rate of evapotranspiration. However, the previous conclusions do not apply when the concentration of Ca(2+) is high, or undersaturation of CaC03 occurs, or for water in terranes of siliceous or silicate rocks. Thus, in a statistical method to describe the relationship between climate and HC03(-) of water, all of the above considerations have to be considered. (Humphreys-ISWS)

Proton NMR and diffusion coefficient measurements were used to study the mobility of sorbed water in Na- and Ca-montmonillonite, Na-and Ca-hectorite, and untreated kaolin. Clay samples were obtained from Ward's Natural Science Establishment, Inc. The montmorillonite and hectorite were saturated by adding a two molar chloride salt solution of either Na or Ca followed by three cycles of shaking, centrifuging, and pouring off the supernatant. Two hydrating methods were used. In the first samples were saturated and air dried while in the second saturated samples were equilibrated at a fixed moisture tension. Sample measurements taken include relaxation rate, pulse gradient diffusion, and tritium diffusion. Results show the measured room temperature spin-lattice, T(1), and spin-spin relaxation time, T(2), as functions of water content at room temperature. For montmorillonite T(1) and T(2) increase with water content with larger relaxation times in sodium clay when moisture is above 80%. Montmorillonite and hectorite had qualitatively similar temperature dependent spin-lattice relaxations. Correlation frequencies for the proton motion from these values were intermediate between those for pure water and ice. Mean proton jump distances were calculated from two to three times the diameter of a water molecule. For kaolin, T(1) and T(2) increase with water content. (Seigler-IPA)

Clay, silt loam, and fine sandy loam were treated with various two-phase crosslinkable polymer systems and with polyvinyl alcohol (PVA) to study their effects on selectd soil characteristics. Surface samples of the three soil types were taken in North Dakota and were analyzed for primary particles size distribution, natural water stable aggregate size distribution, percent organic carbon, and percent calcium carbonate equivalent. Samples were then treated with a variety of types and concentrations of amines and aldehydes of the two-phase crosslinkable polymer system. Some samples were treated with PVA and water to compare treatment effectiveness and to serve as a control. Following treatment four basic tests to determine the quality of soil aggregates on natural soils were preformed: (1) plant available water holding capacity; (2) saturated hydraulic conductivity; (3) water stable aggregate size distribution; and (4) water drop penetration tests to measure water repellency. Results show that the degree of aggregation increases with higher molecular weights and amine/aldehyde system concentrations especially for silts and sands, however, at lower concentrations PVA was more effective than the polymer systems. Variable results were observed for plant water available according to treatment, concentrations and soil type. None of the polmer systems treated cause water repellency but some PVA treated soils moderately repellent. (Seigler-IPA)

SIMULATION OF THE EFFECTS OF TRANSPIRATION LOSSES FROM THE UNSATURATED ZONE ON SEEPAGE FROM A SOIL SLOPE,
Jonkershoek Forestry Research Station, Stellenbosch (South Africa).
P. A. Kilpatrick.
Journal of Hydrology, Vol 46, No 3/4, p 301-309, April 1980. 4 Fig, 3 Tab, 3 Ref.

Descriptors: *Model studies, *Transpiration, *Seepage, *Unsaturated flow, Soil water movement, Streamflow, Mathematical models, Numerical analysis, Finite element analysis, Porous media, Hydraulic conductivity, Moisture content, Pressure head, Saturated flow.

In this study the program UNSAT 1 was used to simulate the drainage of water from a uniform soil on a hillslope so as to investigate the effects of extraction of water from the unsaturated zone. UNSAT 1 uses a Galerkin-type finite-element method to solve the partial differential equation for flow in a saturated-unsaturated porous medium. The results suggest that: (1) The response of the flow system to extractions from the unsaturated zone is fast enough for a diurnal fluctuation in transpiration from the unsaturated zone to cause a diurnal fluctuation in streamflow. (2) A reduction in streamflow caused by a transpiration loss from the unsaturated zone will be much smaller than the transpiration loss. These inferences are tentative because of the following limitations of this study: (1) Material balance errors are of the same order of magnitude as the reductions in seepage outflow. (2) Constant rates of extraction were used. (3) Only one soil type was used. (Humphreys-ISWS)

AN AUTOMATIC ELECTRICAL RESISTANCE SOIL-MOISTURE MEASURING SYSTEM,
Kansas Univ., Lawrence.
T. H. L. Williams.
Journal of Hydrology, Vol 46, No 3/4, p 385-390, April 1980. 3 Fig, 7 Ref.

Descriptors: *Soil moisture meters, *Instrumentation, *Calibrations, Soil moisture, Resistance, Physical properties, Electrical resistance, Electrical properties, Measurement, Gypsum, Gypsum resistance blocks.

The design, calibration, and operation of a reliable yet simple automatic scanning and recording electrical resistance system for the measurement of soil moisture were described. The electrical resistance soil-moisture measuring block utilizes two electrodes separated by some insulating porous material. The material takes up water when placed in contact with the soil until the moisture tension within it equilibrates with the moisture tension in the soil. Subsequent changes in the soil-moisture tension are reflected in variations in the moisture content of the block. The electrical resistance between the electrodes of the block is related to its moisture content and, therefore, a calibration curve of soil moisture vs. block resistance can be constructed. Three types of resistance block are in common use, employing either gypsum, fiberglass, or nylon as the insulating material. The system described was based on the gypsum block but will work equally well with the other types. The system has operated successfully in a field site for two years without problems. The linearity of the calibration curve is retained down to low battery voltages, and the gradient of the curve varied by less than 5% over a period of two years. Measurement accuracy is better than 3%. The system is substantially independent of variations in temperature, the reference resistances having temperature coefficients of 0.05% per degree Celcius. CHLORIDE DISPLACEMENT BY WATER IN HOMOGENEOUS COLUMNS OF THREE SOILS,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Soils.
B. S. Ghuman, and S. S. Prihar.
Soil Science Society of America Journal, Vol 44, No 1, p 17-21, January-February 1980. 4 Fig, 2 Tab, 16 Ref.

Descriptors: *Leaching, *Soil water movement, *Dispersion, Salts, Chlorides, Infiltration, Soil water, Wetting, Soils, Soil types, Laboratory tests, Equations, Soil moisture, Soil science, Chloride displacement, Convection-diffusion equation.

The comparative effects of soil texture on solute profiles during miscible displacement of noninteracting electrolytes are not available in the literature. The displacement of a surface slug of chloride during infiltration and redistribution of water in columns of loamy sand, sandy loam, and silt loam soils was studied. For air-dry soil, maximum solute concentration occurred at the wetting fronts in sandy loam and silt loam but lagged behind the front in the loamy sand. Nevertheless, the position of the solute front coincided with the wetting front in all three soils. After redistribution, the salt peak for v = 1.0 cm/hour was located several centimeters behind the wetting front in the air-dry loamy sand, but coincided with the wetting front in air-dry sandy loam and silt loam. In initially moist soils the salt peak lagged behind the wetting front in all soils. While the depth of chloride peak was not affected by initial soil wetness (theta sub 1) in sandy loam and silt loam, in the loamy sand the salt peak occurred at shallower depth with theta sub 1 = 0.10 than with theta sub 1 = 0.07 cu cm/cu cm. An analytical solution of the solute transport equation described reasonably well the shape and location of chloride slug immediately after its displacement with a given rate and amount of water. When infiltration and redistribution times were matched, water applied at v = 1.0 cm/hour (or ponding in silt loam) moved the salt deeper than v = 0.1 cm/hour in sandy loam and silt loam soils. But in the loamy sand the reverse was true because the redistribution water after the faster application moved through larger pores without taking along the salt. (Sims-ISWS)

Simulated rainfall trials were conducted in wheel-tracked and nonwheel-tracked interrows for three row crop tillage systems (fall moldboard plow with spring disk and harrow, fall chisel with spring disk and no till) at three locations in the northwestern Corn Belt to determine the effect of wheel traffic from the planting operation on interrow runoff and infiltration. Roughness and total porosity differences were noted between the tillage systems and wheel-track variable. Simulated rainfall was applied with a sprinkling-type infiltrometer at a rate of 12.7 cm/hour simultaneously to wheel-tracked and nonwheel-tracked interrows. Differences in energy, reported as rainfall erosion index (EI), to initiate runoff between tillage systems were observed, but these differences were not uniform between locations. In general, the tilled systems required a higher EI to initiate runoff than the no-till system. In paired comparisons, the nonwheel-tracked interrow required a higher EI to initiate runoff and had a higher infiltration rate during runoff than did the wheel-tracked interrow at all locations on all tillage systems. Results from this study suggested that the frequency of interrow traffic must be considered in the design of tillage systems for water conservation and erosion control. (Sims-ISWS)

Descriptors: *Nutrients, *Drainage, *Subsurface drainage, *Water quality, *Florida, Acidic soils, Sands, Nitrogen, Water pressure, Soil water, Soil water movement, Drains, Linings, Subsurface drains, Fertilizers, Agricultural chemicals, Agriculture, Cultivation, Spodosol.

Nutrients applied to citrus growing in subsurface-drained acid, sandy soils of Florida are subject to movement through the soil and possible loss through drainage water especially after intense rainfall. The primary objective of this investigation was to determine the spatial distributions of soil water pressure head and concentrations of nitrogen (N03-N and NH4-N) in the soil solution after fertilization and irrigation of citrus in a subsurface-drained Spodosol. The soil treatments were: (1) shallow tillage and shallow liming (ST), and (2) deep tillage and deep liming (DTL). Tensiometers and solution sampler cups were placed at several soil depths and lateral distances on either side of a subsurface drain. Results showed transport of water and nutrients in the ST soil was rapid relative to DTL soil. Two-dimensional contours of equal soil-water pressure revealed that, after a 3.4-cm irrigation, slower drainage in DTL soil relative to ST raised the water table near the soil surface (to within 30 cm), of the DTL soil, whereas the water table in the ST soil rose to only about 80 cm from the soil surface. Observed distributions of N03-N and NH4-N concentrations in the soil solution exhibited considerably higher spatial variability than soil water pressure head distributions for both soils. Concentrations of N03-N were always higher than NH4-N in either soil. Rates of drainage were higher for ST than DTL soils. Over a 2-week period, the amount of N03-N in the drainage water from ST soil was four times greater than from DTL soil. It was concluded that N03-N was less susceptible to leaching loss in the DTL soil than in the ST soil. (Sims-ISWS)

Water Resources Research, Vol 15, No 5, p 1065-1072, October 1979. 4 Tab, 118 Ref. OWRT C-6169 (No 5217)(2), 14-31-0001-5217.

Descriptors: *Lakes, *Model studies, *Mathematical models, *Reviews, Cold regions, Subarctic, Temperature, Water temperature, Ice, Snow, Water quality, Algae, Zooplankton, Fish, Water chemistry, Publications, Northern lakes.

While there are many diverse temperate lake models available, there are none which are comprehensive annual northern lake models. Northern lakes are those which lie above 40 deg N latitude, have continuous winter ice cover, and experience large seasonal differences in daylight patterns. Therefore, it is necessary to review the temperate ecosystem and smaller process models along with reported field studies to assess model adequacy for northern application. While most northern lake processes have been described in the literature, there is little agreement between investigators as to specific formulations. However, lake modeling can be a viable tool in northern lake utilization studies provided certain precautions are taken. When using the various formulations presented in this review to develop and apply a model, all assumptions of each component should be considered. Also, the uncertainty in the data and model should be incorporated or at least considered with the resulting estimates. (Sims-ISWS)

RADIO-MANGANESE, -IRON, AND -PHOSPHORUS UPTAKE BY WATER HYACINTH AND ECONOMIC IMPLICATIONS,
University of South Florida, Tampa.
T. N. Cooley, M. H. Gonzalez, and D. F. Martin.
Economic Botany, Vol 32, No 4, p 371-378, October-December 1978. 2 Fig, 2 Tab, 13 Ref.

Descriptors: *Water hyacinth, *Phosphorus, *Iron, *Manganese, *Plant physiology, *Nutrient removal, Kinetics, Nutrients, Nutrient requirements, Tracers, Root distribution, Leaves, Sewage treatment, Sewage lagoons, Water quality, Economics, Rates, Density, Metabolism.

Manganese, iron and phosphorus are all actively absorbed by water hyacinth (Eichhornia crassipes) root systems; however, rates of absorption and translocation differ markedly. Absorption rates of manganese by roots are considerably greater than values for phosphorus or iron. The rate of manganese uptake in roots is 13 and 21 times that for radio-iron, and -phosphorus, respectively. Iron is

taken up by roots at nearly twice phosphorus rates. Phosphorus and manganese rapidly appear in leaves, whereas iron begins to appear slowly in leaves only during the first 21 days. Translocation of iron is slow (manganese rates are 65 times that for iron), and manganese translocation is faster than that of phosphorus by an order of magnitude. Amounts of elements taken up by water hyacinths are calculated to be 7.80 mg P/plant, 5.73 mg Mn/plant and 0.40 mg Fe/plant for one week for plants with mean weights of 3.5 g dwt. Estimates are also made for the amount of phosphorus that is removed from treated sewage by water hyacinth plants. With 18 plants/sq m density, a typical facility processing 3.8 million l treated sewage requires 8,190 sq m surface area and 0.5 m mean depth. With 1 microg P/ml available phosphorus present, about 71% of the available phosphorus can be removed in two weeks. Water hyacinths with 50 plants/sq m density, remove 209 kg P/ha yr; with 500 plants/sq m, 2,093 kg P/ha yr is removed. Water hyacinth utilization to remove selected trace elements can aid sewage treatment and help prevent polluted lakes and streams. (Danovich-Wisconsin)

DAMS AND WILDLIFE,
Wisconsin Univ.-Eau Claire. Dept. of Biology.
R. E. Lewke.
Passenger Pigeon, Vol 40, No 3, p 429-442, Fall, 1978. 6 Fig, 3 Tab, 9 Ref. OWRT A-054-WASH(4), 14-31-0001-3848.

Descriptors: *Riparian waters, *Dams, *Birds, *Ecological distribution, *Environmental effects, Ecology, Impoundments, Rivers, Post-impoundment, Banks, Wetlands, Reservoirs, Flood plains.

Nearly 100 percent of the Lower Snake River flood plain between Lower Granite Dam and Clarkston, Washington, was inundated in February, 1975. Of the area inundated, 16 percent represented valuable riparian habitat and 84 percent represented weedy flood plain habitat. Evidence indicated that most displaced birds would not be able to re-establish themselves in remaining above-pool habitats, and that the loss of below-pool habitats would indirectly cause a decrease in the number of birds remaining in above-pool habitats. Of the 129 bird species observed in the study area before inundation, 50 percent were found to be significantly dependent upon the riparian physiognomic type. Impoundment was estimated to cause the loss locally of over 14,000 birds in summer and 30,000 in winter. Migrant species of birds, excluding waterfowl, did not utilize the Lower Snake River Canyon habitats to a great degree and thus will not be affected nearly as much as permanent, summer, and winter resident species. Since different species will not be affected equally by habitat loss, population density of each species will decline disproportionately. (Howard-Mass)

COMPUTATION OF BED LOAD USING BATHYMETRIC DATA,
National Water Research Inst., Burlington (Ontario), Hydraulic Research Div.
P. Engel, and Y. L. Lau.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY3, Proceedings Paper 15255, p 369-380, March 1980, 5 Fig, 2 Tab, 16 Ref, 2 Append.

Descriptors: *Bathymetry, *Sediment load, *Bed load, Bed load samplers, Sediment transport, Surveys, Hydraulics, Sedimentation, Sediment discharge, *Bed forms, Bed load movement, Bed load transport.

A method of calculating bed-load transport was presented. This method takes advantage of the rapid bathymetric surveys that can be made in large rivers. The proposed equation is based on sediment continuity and an assumption for the base level of zero transport. Experimental data were obtained in a series of flume tests, and the measured transport rates were compared with the calculated transport rates using the proposed equation. Comparisons were also made with the Ackers-White equation. (Lee-ISWS)

The regimes of early Tertiary Lakes Gosiute and Uinta were strongly affected by pronounced imbalance between evaporation and recharge by surface and groundwater. Both evaporation and recharge were strongly affected by the climate of the closed hydrographic basins where the lakes formed. However, at unique times in the histories of the Lake Gosiute and the Lake Uinta basins, the regimes of these lakes were significantly modified by enlargement of the drainage basins to include water from basins farther north. Evidence for changes in the size of drainage basins includes southward dispersal of volcaniclastic sands containing basaltic to dacitic volcanic rock fragments from the Absaroka volcanic field in northwestern Wyoming. The southward progradation of the resulting sandstone units from the Wind River Basin into the greater Green River Basin and from there into the northern Piceance Creek Basin records the successive depositional filling of closed hydrographic basins so that water and sediment were transported by streams over the lowest divides into the adjacent basins. Filling of these basins allowed large volumes of surface and groundwater to be added first to Lake Gosiute and then to Lake Uinta. The added water resulted in: (1) a rise in lake level, (2) the development of nutrient-rich lakes where algal productivity led to the deposition of precursors of oil shale, and (3) in the case of Lake Uinta, a change in water chemistry such that brines precipitated sodium carbonate rather than calcium sulfate minerals. Basin filling and enlargement of the drainage systems were probably a consequence of tectonic activity and stability of the basins and adjacent uplifts, although climatic conditions that increased sediment yield and runoff in the hydrographic basins also could have hastened their filling. However, it is difficult to explain patterns of evaporite minerals, oil shale, mudstone, and sandstone formed in Lakes Gosiute and Uinta if climate was the dominant factor. (Humphreys-ISWS)

Descriptors: *Sediment discharge, *Channel erosion, *River flow, *Idaho, *Geomorphology, Dam failure, Floods, Channel improvement, Natural flow, Sediment transport, Deposition(Sediments), Equilibrium, Bank erosion, Bed load, Hydrologic data, *North Fork Teton River(Idaho), *Teton Dam(Idaho).

The Teton Dam failure flood of June 5, 1976, severely disrupted the geomorphic character of North Fork Teton River in Idaho. Extensive channel restoration was required to contain expected normal spring flows. Six principal sites were established on the 17-mile reach of the river to study sediment transport and channel change during 1977-78. During April 1 to September 30, 1977, total water discharge at Teton Island bridge was 97,530 acre-feet; 4,360 tons of total sediment were transported. Total water discharge, April 1 to September 30, 1978, was 191,940 acre-feet; 10,680 tons of total sediment were transported. Analyses of data indicated several trends of erosion and deposition. Minimal channel change in the upper 7 miles of the river indicated equilibrium may temporarily exist between hydraulic-flow properties and channel shape. Streambed profiles indicated little change in streambed elevations. Erosional tonnage at mid-study reaches was 4,260 tons. One-half mile downstream, an increase of 4,150 tons of suspended and 1,050 tons of bedload sediment probably was partly derived from upstream bank erosion. An estimated 5,870 tons was deposited within the next subreach downstream. Virtually the entire bedload was redeposited before the last subreach, 4.4 miles downstream measured bedload was 91 tons. Suspended-sediment discharge transported past the last site was 16,470 tons. Lateral erosion and deposition in the lower 10 miles of the river indicate that subreaches now shortened by man-made channel alinements may begin to meander. Future deposition of coarse material at upstream gravel and concrete impoundments may trigger instability in the entire river. (Kosco-USGS)

RECENT GRADATIONAL AND CHANNEL-MIGRATION HISTORY OF THE KANSAS RIVER -- A GUIDE FOR FLOODPLAIN MANAGEMENT,
Kansas Water Resources Research Inst., Manhattan.
W. Dort, Jr.

Available from the National Technical Information Service, Springfield, VA 22161 as PB80-174501, Price codes: A06 in paper copy, A01 in microfiche. Project Completion Report, April 1980, p 80, 7 Fig, 40 Ref. OWRT A-083-KAN(1), 14-34-0001-7035.

Descriptors: *Channel morphology, *Channel erosion, Bank stability, Bank stabilization, Meanders, Flood plains, Kansas, *Kansas River, Bank erosion, Bed erosion, Alluvial channels, River regulation, Meander migration, *Channel migration.

Since 1976, studies of the history of migration of 725 channel miles of the Kansas River and major tributaries have proceeded under contract with the Kansas City District of the U.S. Army Corps of Engineers. An 85-mile reach from Topeka to Kansas City has been investigated for the Kansas Water Resources Research Institute. Both projects are continuing. Historical data on channel shape and position have been acquired from published maps judged sufficiently accurate back into the 1850s. Scattered information about prehistoric courses was obtained by analysis of floodplain scrolls and abandoned channels visible on aerial photographs. The Corps has recently published an atlas of 41 maps that display changes in channel position by use of eleven colors. The 125-year record on the Kansas River reveals a spatial alternation of stable and unstable reaches. Some portions of the channel have moved rapidly across the floodplain in complex patterns; other segments have remained absolutely immobile. Locations of movement with the past ten or so years do not all correlate with sites of earlier movement. Sudden migration has locally erupted in areas stable for the preceding century.

NIPS, NOTCHES, AND THE SOLUTION OF COASTAL LIMESTONE: AN OVERVIEW OF THE PROBLEM WITH EXAMPLES FROM GREECE,
California Univ., Davis. Dept. of Geology.
C. G. Higgins.
Estuarine and Coastal Marine Science, Vol 10, No 1, p 15-30, January 1980. 4 Fig, 2 Tab, 48 Ref. ONR Nonr-2211-02.

Descriptors: *Coasts, *Erosion, *Limestone, *Calcium carbonate, Shores, Dissolved solids, Rocks, Freshwater, Saline water-freshwater interfaces, Sea water, Groundwater, Tides, Water levels, Waves(Water), Oceans, *Greece, Coastal erosion, Nips, Notches.

The origins of intertidal indentations and undercuts (nips and notches) in calcareous shores has long been disputed. In recent years this dispute has centered on the efficacy of solution by seawater vs. the erosional effects of marine organisms. Little attention has been given to solution by fresh groundwater even though it is a proven solvent of calcareous rocks whereas seawater is not. The solutional effects of groundwater--either floating as a surface layer on seawater or seeping through porous rocks at the shoreline--would be strictly confined to the intertidal zone and most intense at midtide level. Just such a distribution of erosional effect is required for the formation of nips and notches, yet such a distribution of effect has yet to be demonstrated either for seawater or for most erosional marine organisms. On purely theoretical grounds, then, solution by groundwater deserves consideration as a major factor in the origin of coastal undercuts. In Greece, notches in calcareous rocks occur only in proximity to coastal springs, where surface seawaters are locally diluted by freshwater. Percent saturation of these waters with respect to calcium carbonate is not known, but the one-to-one correspondence of notches with springs is by itself persuasive circumstantial evidence that solution by groundwater is the chief factor in the origin of the notches. RECENT SEDIMENTATION HISTORY OF THE WAIMAKARIRI RIVER, NEW ZEALAND,
Ministry of Works and Development, Christchurch (New Zealand). Water and Soil Div.
G. A. Griffiths.
Journal of Hydrology (New Zealand), Vol 18, No 1, p 6-28, 1979. 10 Fig, 3 Tab, 1 Plate, 25 Ref.

Descriptors: *Sedimentation, *Aggradation, *Gravels, *Degradation(Stream), Rivers, Watersheds(Basins), Erosion, Sediment transport, Meanders, Bank erosion, Mathematical models, Suspended load, Bed load, *New Zealand, Sedimentation history, Kinematic wave model.

The Waimakariri River is one of several large, steep, braided, gravel-bed rivers that rise in the Southern Alps of New Zealand and flow eastwards to the Pacific Ocean. Its upper catchment has a mountainous topography reflecting continuing rapid uplift and extensive glacial and postglacial erosion; in its lower catchment the river is incised into a number of outwash and aggradational surfaces. The transition between downcutting and fan building is currently located about 18 kilometers from the sea. Below the transition, severe aggradation is occurring. Quantitative analysis of river cross-section survey data collected over the past 45 years demonstrates that at least 65% of this aggradational material is derived locally--not from the upper catchment area where the channel is stable. Over the past century the lower catchment channel has been confined over most of its length by regulatory works. There, major changes in sedimentation patterns include the imposition of a broad meander pattern, extensive channel bank erosion, bed degradation and aggradation, and the downstream migration of a gravel tongue. An example was given of a river reach that has translated amounts of gravel far in excess (49 times) of its theoretical bed load transporting capacity while remaining substantially unaltered in width, bed material size, slope, and mean bed level. Much of this gravel is supplied by bank erosion and channel bed degradation; this material moves downstream as channel sediment waves. A mathematical model was presented describing the kinematics of these waves. Long-term, at-a-station, sinusoidal fluctuations in mean bed level on another river were presented as further field evidence for their existence. (Lee-ISWS)

SEDIMENT LOADS OF NORTH ISLAND RIVERS, NEW ZEALAND--A RECONNAISSANCE,
Cornell Univ., Ithaca, NY. Dept. of Geological Sciences.
J. Adams.
Journal of Hydrology (New Zealand), Vol 18, No 1, p 36-48, 1979. 2 Fig, 2 Tab, 25 Ref.

Descriptors: *Suspended load, *Bed load, *Dissolved solids, Watersheds(Basins), Rivers, Sediment transport, Suspended solids, Sediment load, Flow, Sediment yield, Erosion, Erosion rates, River flow, River basins, *Dissolved load, *New Zealand.

Suspended load, dissolved load, and bed load (for 23 catchments only) were calculated by approximate methods for 40 rivers in the North Island. The proportion of each type of load was roughly 88%, 10%, and 2%, but the dissolved load was relatively more important in rivers draining catchments with slight erosion and the bed load more important in rivers draining directly from the eastern mountain ranges. The river catchments, mostly 150 to 1500 sq km in area, had suspended sediment yields ranging from 35 t/sq km/yr to 28,000 t/sq km/yr with the highest yields being from catchments in the East Cape region. 2K. Chemical Processes

PRECIPITATION ACIDITY: THE ROLE OF THE FOREST CANOPY IN ACID EXCHANGE,
Oak Ridge National Lab., TN. Environmental Sciences Div.
W. A. Hoffman, Jr., S. E. Lindberg, and R. R. Turner.
Journal of Environmental Quality, Vol 9, No 1, p 95-100, January-March 1980. 3 Fig, 2 Tab, 35 Ref. DOE W-7405-eng-26.

Descriptors: *Precipitation(Atmospheric), *Acidity, *Forests, Trees, Oak trees, Leaves, Vegetation effects, Acids, Sulfates, Nitrates, Organic compounds, Hydrogen ion concentration, Sampling, Chemical analysis, Rain, Air pollution, Path of pollutants, Water pollution, Water chemistry, Acid precipitation.

Individual rain events were sampled above and below the forest canopy in Walker Branch Watershed, Tennessee, from August 1977 to June 1978 for the purpose of analysis of acidity and organic content. Strong acid content correlated with sulfate concentrations. Total acid concentrations were conserved as rain penetrated chestnut oak (Quercus prinus L.) canopies, although the strong/weak acid ratio decline substantially. Although weak acids constituted at least 30% of the total acidity of incident rain and increased to over 50% in throughfall, the increase could not be entirely attributed to organic acids. The results of the study support the fundamental importance of ion-exchange models in systematizing rain-vegetation interactions. (Sims-ISWS)

PREDICTED CORROSION AND SCALE-FORMATION PROPERTIES OF GEOPRESSURED GEOTHERMAL WATERS FROM THE NORTHERN GULF OF MEXICO BASIN,
Y. K. Kharaka, M. S. Lico, and W. W. Carothers.
Journal of Petroleum Technology, Vol 32, No 2, p 319-324, February, 1980. 2 Fig, 2 Tab, 20 Ref.

Descriptors: *Geothermal studies, *Corrosion, *Scaling, Chemical analysis, Gulf of Mexico, Chemical precipitation, Equations, Water chemistry, Chemical reactions.

This paper describes chemical and physical parameters of selected geopressured geothermal water that indicate their potential for corrosion and scaling. Detailed chemical analyses of 120 water samples from depths of 1,000 to 5,600 m show that the salinity of water in the geopressured zones ranges from 10,000 to 270,000 mg/l dissolved solids. Na and Cl generally constitute more than 90% of the total cations and anions, respectively. Corrosion and scale-formation properties of geopressured geothermal water are different from those of waters with similar chemical composition but produced from oil and gas wells. This is due to higher temperatures and withdrawal rates and the absence of oil in geopressured geothermal waters. The high salinity, Cl concentration and temperature increase the corrosivity by facilitating dissolution of iron at

anodic sites. The corrosivity will be controlled by reactions at cathodic sites which are slow due to the almost complete absence of dissolved oxygen, absence of sulfate-reducing bacteria, and low activity of H+. Hydrogen Sulfide corrosion will be minimal because the concentrations of H2S are less than 1 mg/l. Scale formation from precipitation of carbonates of Ca, Sr, and Ba, sulfate of Ba, and oxyhydroxides of iron is likely during production. (Purdin-NWWA)

2L. Estuaries

THE ESTUARY REVISITED,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
J. R. Schubel, and D. J. Hirschberg.
Water Spectrum, Vol 12, No 2, p 1-9, Spring 1980. 10 Fig.

Descriptors: *Estuaries, *Evolution, *Geologic history, *Speciation, Estuarine environment, Estuarine fisheries, Brackish water, Shellfish, Chesapeake Bay, Fjords, Glaciers, Commercial fishing, Fish harvest, Ecosystems, Sedimentation, Saline water-freshwater interfaces.

An intensive literature review was used to assess estuaries which are semi-enclosed coastal bodies of water that are freely connected to the open ocean and are measurably diluted by freshwater from runoff. A range of geological processes form estuaries such as bar-built estuaries, tectonically formed estuaries, fjord estuaries, and submerged river valley estuaries. Estuaries have not persisted throughout geologic time but are formed or destroyed with changes in ocean water level resulting from the advance or retreat of glaciers. All modern estuaries are geologically very young, approximately 10,000 years, and were formed when the present Holocene Interglacial period began. Estuaries have short geologic life spans measurable in thousands or tens of thousands of years. Estuaries are not vital to the survival of species which inhabit them. During past glacial periods when estuaries were rare or absent these organisms must have lived in open, shallow, brackish areas. Also, there is no evidence that estuaries have played a major role in the evolution of marine species. Estuaries are, however, important as fisheries since without them the finfishes and shellfishes harvested by man would not exist in sufficient number for harvesting. Man is the most estuarine-dependent organism, he makes the most demands, and is the only organism capable of managing estuaries to produce their longest biologically and recreationally useful life. Observations of currents 12 km south of the Long Island coast show that strong offshore winds could generate considerable longshore nontidal flow well below any surface Ekman drift. A momentum balance calculation in the longshore direction shows a surface level gradient of order 0.000001 to be the proximate cause of the longshore flow. A very simple model of the observed phenomena is a sloping plane beach acted upon by cross-shore wind, varying sinusoidally in the longshore direction. With bottom friction parameterized by a linear law, a parabolic equation is found to govern steady state flow, expressing a balance of vorticity tendencies due to cross-isobath flow, curl of bottom stress, and any forcing. Calculated solutions for variable cross-shore wind show a trapped pressure field on the inner shelf which controls the transition between an essentially frictionless momentum balance on the outer shelf to frictionally dominated flow at the shore. Realistic estimates of the parameters entering the theory suggest that the longshore gradients associated with the trapped inner shelf field are of the correct order of magnitude to explain the generation of longshore flow by a system of cross-shore winds. BENTHIC INFAUNAL VARIABILITY ON A TRANSECT IN THE GULF OF MEXICO,
Texas Univ. at Austin, Port Aransas. Marine Science Inst.
R. W. Flint, and J. S. Holland.
Estuarine and Coastal Marine Science, Vol 10, No 1, p 1-14, January 1980. 5 Fig, 4 Tab, 34 Ref. BLM AA550-CT6-17.

Descriptors: *Benthic fauna, *Coasts, *Gulf of Mexico, *Texas, Benthos, Biological communities, Marine biology, Continental shelf, Sediments, Sampling, Variability, Temperature, Water temperature, Salinity, Depth, Biology.

Macroinfaunal benthos off the South Texas Coast of the Gulf of Mexico formed different assemblages distributed according to depth: shallow (22 m), mid-depth (36 to 49 m), and deep water (78 to 131 m). Species composition of shallower stations were less diverse, composed of eurytopic and opportunistic species adapted to a fluctuating environment. The deep water benthos, in a more stable environment, had a higher diversity. Sediment composition (high proportions of silt) at the mid-depth stations resulted in dominance of deposit feeders. The environmental gradient was related to a species continuum which changed from polychaete dominated groups in shallow water, to deposit feeding molluscs and crustaceans, to a deep water diverse fauna not dominated by any particular group. Environmental heterogeneity, including climatic variability, may be most important in controlling shallow water benthos. In deeper more stable shelf habitats where diversities are higher and species equilibrium is the case, species interactions may determine community structure. (Sims-ISWS)

RECURRING AGGREGATION OF ZOOPLANKTON BY A TIDAL CURRENT,
California Univ., Santa Barbara. Dept. of Biological Sciences.
A. L. Alldredge, and W. M. Hamner.
Estuarine and Coastal Marine Science, Vol 10, No 1, p 31-37, January 1980. 2 Fig, 1 Tab, 17 Ref.

Descriptors: *Zooplankton, *Distribution patterns, *Spatial distribution, *Currents(Water), *Australia, Coasts, Shores, Tides, Tidal waters, Tidal effects, Circulation, Water circulation, Velocity, Fish, Benthic fauna, Marine biology, Aggregation.

Zooplankton densities up to 40 times greater than those in adjacent water accumulated in the lee of a small point protruding into a strong tidal current at Whitsunday Island, Queensland, Australia. The density of plankton in the lee was linearly correlated with current velocity past the point, reaching maximum concentrations at mid-flood tide and decreasing as slack tide approached. Zooplankton did not accumulate when tidal flow reversed direction. Possible mechanisms of aggregation were discussed. Mass transport of zooplankton into lees by fine-scale current patterns may be a major cause of plankton aggregation in some near-shore localities and may significantly affect the distribution of fish and benthic invertebrates. A ONE-DIMENSIONAL REPRESENTATION OF RESIDUAL CURRENTS IN THE SEVERN ESTUARY AND ASSOCIATED OBSERVATIONS,
Institute for Marine Environmental Research, Plymouth (England).
R. J. Uncles, and M. B. Jordan.
Estuarine and Coastal Marine Science, Vol 10, No 1, p 39-60, January 1980. 9 Fig, 1 Tab, 22 Ref.

Descriptors: *Estuaries, *Tides, *Water circulation, *Water balance, *Model studies, Mathematical models, On-site investigations, Measurement, Water levels, Circulation, Currents(Water), Energy, Energy budget, Tidal waters, Coasts, *Severn Estuary(England), *England.

A one-dimensional hydrodynamical model was used to describe the cross-sectionally averaged Stokes drift and Eulerian residual (tidally averaged) currents in a section of the Severn Estuary between Porthcawl and Sharpness. Residual variables were computed for periodic M sub 2 tides, and as functions of time during simulated spring-neap cycles. The results for periodic M sub 2 tides showed that the landward directed Stokes drift has a spatially averaged value of 3.5 cm/s in the Severn Estuary, which, in the absence of freshwater inputs and meteorological perturbations, is balanced by seaward flowing Eulerian residual currents. The residual setup of water (i.e., the mean surface elevation relative to the value at the seaward boundary) is mainly determined by the magnitudes of the axial density gradients and friction, with the friction dominating for typical salinity distributions; the landward flow of water due to the Stokes drift contributes to the setup, which drives the seaward residual currents against the opposing frictional forces. It was shown that the magnitude of the Stokes drift is mainly determined by the estuary's geometry, the strength of the tidal streams, and the friction (regardless of whether a quadratic or linearized friction law is assumed), the effects of density gradients and axial momentum advection and dispersion being negligible. The computed values of the Stokes drift were compared with observations at nine anchor stations and covering 28 tidal cycles; the agreement between observations and theory was generally good. SHORT-TERM VARIATIONS IN PHYTOPLANKTON BIOMASS IN A TIDAL ESTUARY IN NORTHERN BRITTANY,
Station Biologique de Roscoff (France).
C. Riaux, and J-L. Douville.
Estuarine and Coastal Marine Science, Vol 10, No 1, p 85-92, January 1980. 4 Fig, 4 Tab, 22 Ref.

Descriptors: *Phytoplankton, *Variability, *Estuaries, *Tidal waters, Chlorophyll, Salinity, Water temperature, Water levels, Biomass, Plankton, Tides, Tidal effects, Hydrodynamics, Sampling, Model studies, Mathematical models, *Penze Estuary(France).

Seasonal and short term variations in phytoplankton biomass were examined in the Penze estuary (Northern Brittany) from June 1975 to July 1976. A simple model was proposed to characterize the seasonal variation of chlorophyll a concentration from June 1975 to June 1976. The tidal cycle seems to induce diurnal variations which may be very important in summer in the upper part of the river. Chlorophyll a concentration increases towards low tide and correlates with salinity and water level. (Sims-ISWS)

WAVE SETUP OF HARBOR WATER LEVELS,
Commonwealth Scientific and Industrial Research Organization, Cronulla (Australia). Div. of Fisheries and Oceanography.
R. O. R. Y. Thompson, and B. V. Hamon.
Journal of Geophysical Research, Vol 85, No C2, p 1151-1152, February 20, 1980. 1 Ref.

Descriptors: *Waves(Water), *Harbors, *Water levels, Oceanography, Sea level, Estuaries, Oceans, Gages, Mathematical models, Theoretical analysis, *Wave setup, Radiation stress, Surface waves.

Radiation stress by incoming sea surface waves or swell can raise the mean level of water in a harbor by an amount independent of the size of the harbor. This setup can be a significant confounding factor in determining sea level changes if the sea level gage is inside a harbor with a moderately shallow entrance. The mechanism is independent of 'inverse barometer' or wind setup effects, though it is likely to enhance them. (Lee-ISWS)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

DESALTING: AN OFFER YOU MAY NOT REFUSE,
Office of Water Research and Technology, Washington, DC.
W. H. McCoy.
Water Spectrum, Vol 12, No 2, p 48-53, Spring 1980. 8 Fig.

Descriptors: *Desalination processes, *Distillation, *Electrodialysis, *Flash freezing, *Ion exchange, *Reverse osmosis, Membrane processes, Flash distillation, Water purification, Freshwater, Saline water, Salinity, Brines, Desalination, Water sources.

As the Earth's freshwater supply continues to shrink on a per capita basis due to population growth and pollution, interest in the desalting of water grows. By the year 2000 the market for desalting in the U.S. is expected to be over 29 billion gallons per day. Distillation, freezing, reverse osmosis, and electrodialysis are currently used methods of desalting. Factors influencing the effectiveness of each process include plant location, energy and its availability, feedwater type, and available brine disposal methods. Freezing and distillation are the preferred methods for desalting water with a high salt concentration. Multi-stage flash distillation, which is commonly used, has a continuous cycle to make maximum use of energy but problems occur due to scaling and fouling. Three major steps are involved in desalting by freezing: partial freezing to form an ice-slurry, separation of ice crystals from brine, and melting the ice. Freezing cannot currently desalt large quantities on an economical basis. Electrodialysis uses a cell pair with different types of ion-selective membranes and a direct current to cause ion migration. In reverse osmosis, also a membrane desalting process, pressure is applied to the salt water side of a semipermeable membrane causing fresh water to flow through the membrane. All of the processes generate brine wastes that are disposed of in a variety of ways. (Seigler-IPA)

THE EFFECT OF WATER PRETREATMENT CHEMICALS ON THE PERFORMANCE AND DURABILITY OF REVERSE OSMOSIS MEMBRANES,
California Univ., Los Angeles. School of Engineering and Applied Science.
J. W. McCutchan, and J. Glater.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-174311, Price codes: A05 in paper copy, A01 in microfiche. Final Report to, Office of Water Research and Technology, January 31, 1980. p 68, 26 Fig, 7 Tab, 45 Ref. OWRT R-0049 (No 7810), 14-30-0001-7810.

Descriptors: *Reverse osmosis, *Membrane processes, *Membranes, *Water treatment, Cellulose acetate type membranes, Polyamide type membranes, Water pretreatment chemicals, Ozone, Chlorine, Bromine, Iodine, Chlorine dioxide, Water flux, Salt rejection, *Membrane damage, *Chemicals, Hydrogen ion concentration.

The sensitivity of commercial reverse osmosis membranes has been studied in a variety of chemical environments. Membranes were supplied by five manufacturers representing three general types. These are cellulose acetate, thin film composite polyamide and homogeneous polyamide. Pretreatment chemicals consisted of halogens, ozone, and chlorine dioxide. Membrane exposure was conducted by soak tests in buffer solutions over a pH range of 3.0 to 8.6 and concentrations between 1.0 and 125 ppm. Assessment of membrane damage was carried out by performance testing in a flat plate laboratory reverse osmosis unit using 5000 ppm sodium chloride feed solution. Chemical attack on membrane polymer was indicated by an increase in water flux and a decrease in salt rejection. Cellulose acetate membranes were the most resistant to chemical attack. They responded only to ozone and were also hydrolized at low pH. Polyamide membranes were sensitive to ozone, halogens, and chlorine dioxide. They were also hydrolized but at low pH. The activity of all chemical agents tested was responsive to solution pH. This factor controls the distribution of halogen molecular and ionic species and consequently the rate and possibly the mechanism of membrane attack. Under conditions which maximize damage, the order of activity of chemicals under study were $O_3 > ClO_2 > Cl_2 > Br_2 > I_2$.

3B. Water Yield Improvement

WEATHER MODIFICATION: WINNERS AND LOSERS,
Illinois State Water Survey, Urbana.
S. A. Changnon, Jr.
Water Spectrum, Vol 12, No 2, p 28-39, Spring 1980. 10 Fig, 2 Tab.

Descriptors: *Weather modification, *Cloud seeding, *Precipitation(Atmospheric), Agroclimatology, Legal aspects, Political aspects, Rain, Water shortage, Weather patterns, Cost-benefit theory, Rainfall intensity, Environmental effects, Agricultural engineering.

Weather modification in the United States is surrounded by considerable scientific uncertainty and local controversy. In the past the major concern was 'can we do it' with the assumption that weather modification would be for mankind's good. Now, however, the socio-politico-economic-environmental aspects of weather modification are asserting themselves. In the 1960's, situations developed where some people believed that weather modification was hurting their real or perceived interests. Although there is little evidence the weather modification actually decreased rainfall in some areas or caused flooding in others, there was much publicity and much of the general public has become skeptical about the use of weather modification. Questions are voiced concerning the effect of increased snowfall in the mountains on elk herds, the long-term effect of silver iodide on the environment, and the actual economic value of weather modification. Scenarios developed to forecast economic values vary widely, bringing more doubt into the issue. Legally, weather modification operators in the United States are subject to the rules and procedures of tort law and it is likely that the absolute liability (risk-spreading) theory will apply although only about a dozen damage actions have been brought. Weather modification will have to proceed in a comprehensive framework involving everyone potentially affected. (Seigler-IPA)

3C. Use Of Water Of Impaired Quality

HYDROLOGIC FEASIBILITY OF UTILIZING PALMS FOR WATER MANAGEMENT IN SOUTHERN NEVADA,
Nevada Univ. System, Reno. Desert Research Inst.
R. O. Patt, and D. E. Zimmerman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-170624, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, March 1978. 26 p, 6 Fig, 5 Tab, 9 Ref. OWRT A-073-NEV(1), 14-31-0001-5029.

Descriptors: *Dates, *Water management(Applied), *Irrigation water, *Water table, Southwest U.S., Nevada, Arid lands, Crop production, Alkaline soils, Sewage effluents, Alfalfa, Climatology, Palms.

The feasibility of utilizing date and ornamental palms as a management tool for beneficial use of groundwater and waste water in water-short areas such as the southwestern United States was investigated. Three potential planting sites in southern Nevada, the Las Vegas, Pahrump, and Moapa Valleys, were studied. Local climatic conditions in these areas were determined to be suitable for palm propagation. Date culture requires long, hot summers, moderate winters, and low precipitation and humidity from July 1 to September 1, the rapid fruit growth period. Palms readily adapt to various soils and will endure saline soil once established. For the three sites studied the only limiting factors found appear to be the availability and source of water supply. The Las Vegas Valley appears to be the most favorable site studied since it is underlain by shallow groundwater, and irrigation from sewage effluent is available. The Las Vegas Valley would also be an ideal area to study hydrologic characteristics of the palm and water table conditions. Alfalfa is currently the main crop in the valley but problems are occurring due to the high water table and poor irrigation water quality. Date palms would be an economically feasible transition crop for the area and could help to stabilize the water table. (Seigler-IPA)

3D. Conservation In Domestic and Municipal Use

STATE AGENCY EFFORTS IN WATER CONSERVATION.
California State Dept. of Water Resources, Sacramento. Div. of Planning.
Memorandum Report, December 1978. 26 p, 3 Fig, 47 Ref, 4 Attachments.

Descriptors: *Water conservation, *Water consumption, *Water management(Applied), *Water policy, *California, Conservation, Water use, Water resources, Water shortage, Regulation, Water demand, Education.

This report examines a State of California program to implement water conservation measures for all state agencies. Sixty-two state agencies met to decide on how the program should be carried out, and all agreed to set up employee education programs, cut down their own direct water use, convey to the community the need and methods for water conservation, and to have regulatory agencies include water conservation in their regulations where possible. Methods of saving water within state agencies included making maximum use of reclaimed water where available, equipping state-owned dwelling units with water-saving shower and toilet devices, reducing 'open hours' for state park shower facilities, reducing water pressure, adopting emergency water conservation and protection measures for certain state managed watersheds, requiring water permittees and applicants to demonstrate evidence of water conservation action, and preparing draft regulations to prevent waste or unreasonable use of water. Some results of the program include the water conservation education of 129,000 state employees, exposure of 5 million citizens to water conservation publications, and the savings of 30,000 acre-feet of water in state facilities in 1977. (Arnold-NC)

A PILOT WATER CONSERVATION PROGRAM.
California Dept. of Water Resources, Sacramento. Bulletin 191, October 1978. 64 p, 20 Fig, 3 Tab, 8 Append.

Descriptors: *Water conservation, *Water saving devices, *Water law, *California, *Water use, *Water management(Applied), Water supply, Conservation, Water resources, Water shortage, Water demand, Education, Water pressure, Water control, Water distribution.

This is a report on a program undertaken after the 1976-77 drought to effect water conservation in homes by introducing water saving devices. The goals of the program were to find out if a significant amount of water and energy could be saved by installing water saving devices in dwellings; to determine which methods of distribution are most successful and cost effective; to evaluate relative merits of selling devices or offering them free, and which devices are most acceptable; and to determine the feasibility of distributing water saving devices throughout the state. Six areas were chosen for pilot projects. Number of households varied from 253 to 370,000, water supply conditions varied from no problem to heavy rationing, and home water conservation kit delivery varied from free door-to-door delivery to purchase upon request. In almost all areas, water savings in homes using the kits was significant, most residents had already heard of the program, and there was little or no correlation between income level and willingness to use the kit. Most people believed they were saving water, and overwhelming majorities in each area believed the devices they installed were working. Annual water savings ranged from 12.5 to 3000 acre feet for the various programs. Toilet dams were found to be the most popular tank devices, and the most successful in saving water. Short intensive distribution of devices was most effective; a telephone hotline was found to be essential for giving information on the program. School education programs proved to be important. Interagency cooperation allowed easier access to urban residents, particularly through use of members of the California Conservation Corps taking the water saving kits directly to the public. Devices should be supplied free of charge. (Arnold-NC)

WATER CONSERVATION IN CALIFORNIA.
California Dept. of Water Resources, Sacramento. Bulletin No 198, May 1976. 95 p, 18 Fig, 29 Tab, 18 Ref, 2 Append.

Descriptors: *Water conservation, *Water policy, *Water law, *California, *Conservation, *Water demand, *Water use, Agriculture, Water resources, Water shortage, Water demand, Water delivery, Hydrologic areas, Regulation, Legal aspects.

This study outlines existing water conservation efforts in the private and public sectors of the economy of the State of California. Following a series of droughts in 1974, 1975, and 1976, the State Department of Water Resources found that water use indicated an 84.69% consumption by agriculture; 13.47% by urban uses; 0.10% for power plant cooling; and 1.74% for fish, wildlife, and recreation. Efforts to persuade the urban sector to save included publishing pamphlets on repair of faulty faucets and plumbing fixtures; reducing exterior residential water use such as lawn watering; installing water saving technology in newly built structures; and installing water-saving devices in existing structures. Examining the state's eleven hydrologic study areas revealed that water shortage problems were exacerbated by economic and development pressures, and thus appropriate land regulatory devices were proposed for those study areas. Possible water savings by the agricultural sector in the eleven study areas ranged 40,000 to 520,000 acre-feet. Major conservation practices in the areas included improved delivery and reuse systems, moratoria on further water extraction, and conjunctive surface-ground operations. For urban water conservation, DWR recommends that all new homes have low-flow device plumbing fixtures; institution of delivery system leak detection programs; and replacing current pricing systems favoring large users with uniform, peak/seasonal or increasing block rates, using the lifeline rate concept where appropriate. Agricultural water conservation measures are also recommended. (Arnold-NC)

3F. Conservation In Agriculture

JOJOBA: AN ALTERNATIVE TO THE CONFLICT BETWEEN AGRICULTURAL AND MUNICIPAL GROUND WATER REQUIREMENTS IN THE TUCSON AREA, ARIZONA,
Arizona Univ., Tucson. Office of Arid Lands Studies.
K. E. Foster, and N. G. Wright.
Ground Water, Vol 18, No 1, p 31-36, January-February, 1980. 1 Fig, 6 Tab, 16 Ref.

Descriptors: *Arid lands, *Oilseed crops, *Ground water, *Water requirement, Irrigation water, Municipal water, Reasonable use, Water consumption, Overdraft, Arizona, Ground water mining, Water rights, Water law, Ground water basins, Economic feasibility, Acreage.

Municipal, agricultural, mineral and industrial ground water withdrawals from two basins in the Tucson area amount to 376,000 acre-feet per year (AFY) or 296,000 AFY more than the safe yield. About 80 percent of this overdraft is for irrigation agriculture. To insure adequate ground water supplies, the City of Tucson has been purchasing and retiring farmlands in one basin. This creates weed problems for farmers owning adjacent land. An alternative to retiring farmlands and heavy irrigation is to cultivate arid-adapted vegetation with economic potential such as Jojoba. It requires only 1.5 AFY per acre compared with traditional crops that average 4 AFY or more, but it needs 10 years of cultivating before it can produce economically feasible yield. If the City of Tucson subsidized farmers during this time at a rate of $40 per acre, it would save more than 50 percent of the cost to purchase and retire farmlands and still be able to draw water from the basin for municipal uses. However, implementing this plan would require changing Arizona ground water law to allow basin exports without the necessity of land aquisition. (Purdin-NWWA)

WATER, WASTE AND QUALITY MANAGEMENT DURING PREPARATION AND PROCESSING OF VEGETABLES,
Arkansas Water Resources Research Center, Fayetteville.
W. A. Sistrunk.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-176969, Price codes: A05 in paper copy, A01 in microfiche. AWRRC Publication No 65, August 1979. 107 p, 6 Fig, 72 Tab, 37 Ref, 4 Append. OWRT A-032-ARK(1).

Descriptors: *Vegetable crops, *Waste water(Pollution), *Consumptive use, Efficiencies, Water requirements, Potatoes, Beans, Crops, Fermentation, Sweet potatoes, Agriculture, Industrial wastes, Anaerobic condition, Biochemical oxygen demand, Water quality.

Effluent from vegetable processing plants in the Ozark region was monitored to test and develop new systems of washing, peeling and blanching; to develop methods for utilization of solid wastes; and to reduce effluent wastestrength without affecting vegetable quality. From a processing plants' survey the following operation or factors were found to be the most critical: (1) washing and cleaning, (2) blanching and cooling, (3) high wastestrength from Irish potatoes, dry beans, and

hominy processing, (4) suspended solids removal, and (5) excessive fresh water use. Various processing techniques were tested and waste water was sampled for biochemical oxygen demand, chemical oxygen demand, total suspended solids, settleable solids, and total solids. Vegetable processing methodologies tested included repetitive washing of spinach in the same water to cut down on consumption, steam blanching instead of water blanching, reduced soaking time for dry beans to reduce high wastestrength, and a new hominy preparation method to reduce pollution. The new system of leafy greens washing cut water use by 70% while reducing wastestrength by 50%. Extensive tables of results are given. Results from experiments of the storage and fermentation of high alkalinity wastes from Irish and sweet potatoes are also described. (Seigler-IPA)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

THE NORTH MAROONDAH EXPERIMENT PRETREATMENT PHASE COMPARISON OF CATCHMENT WATER BALANCES,
Melbourne and Metropolitan Board of Works (Australia).
K. J. Langford, R. J. Moran, and P. J. O'Shaughnessy.
Journal of Hydrology, Vol 46, No 1/2, p 123-145, March 1980. 6 Fig, 6 Tab, 19 Ref.

Descriptors: *Australia, *Watersheds(Basins), *Water balance, *Vegetation regrowth, *Ash trees, Streamflow, Statistical methods, Regression analysis, Water supply, Forest management, Rainfall, Topography, Drainage density, Mountain ash, Basal area, Radiation index, Wetted area.

The North Maroondah Experimental Area contains a series of controlled catchment experiments which have the two major objectives of investigating the effects on long-term streamflow yields of reducing the density of existing 1939 regrowth mountain ash (Eucalyptus regnans), and controlling the density of planting or sowing at the time of establishment of new stands. The aims of the analysis described in this paper are to examine the relationships between catchment water balances and catchment characteristics for the pretreatment period, and to identify any atypical catchments. An intercatchment comparison of twelve regrowth catchments based on an analysis of covariance of annual streamflow and catchment loss (i.e., catchment rainfall minus streamflow) identified two catchments which are losing water, and one collecting water from outside its topographic boundaries. Further statistical analyses of data from the nine typical regrowth catchments detected significant relationships between average catchment loss, radiation index, and basal area of regrowth forest on the catchment. Catchment loss increased with both radiation index and basal area. The results indicated that if a thinned forest behaves in the same way as a natural forest with low basal area increases in streamflow resulting from thinning would be important from a water supply point of view. A comparison of the nine typical regrowth and two old growth catchments showed that the old growth catchments had significantly lower catchment loss. Further analysis showed that there was a significant relationship between annual catchment loss and stocking rate of trees for the eleven catchments. The decrease in streamflow which would result from conversion of an open old growth forest (20 trees/ha) to a dense regrowth forest (400 trees/ha) is of the order of 100-200 mm which is also important from a water supply point of view. EFFECTS OF WETLANDS ON WATER QUALITY IN THE DEVILS LAKE BASIN, NORTH DAKOTA,
North Dakota State Univ., Fargo. Dept. of Zoology.
J. J. Peterka.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-175292, Price codes: A02 in paper copy, A01 in microfiche. North Dakota Water Resources Research Institute, North Dakota State University. Research Project Technical Completion Report, October 1979. p 17, 3 Fig, 1 Tab, 4 Ref. OWRT A-052-NDAK(1).

Descriptors: *North Dakota, *Wetlands, *Runoff, *Phosphorus, *Nitrogen, Drainage water, Watersheds(Basins), Agricultural runoff, Nutrients, Water quality, Dissolved solids, Soil properties, Surface runoff, Grassed waterways, Watershed management.

Contributions of dissolved and particulate substances to the runoff from drained wetlands and agricultural lands were studied in the Starkweather Watershed of the Devils Lake Basin, North Dakota. The Starkweather coulee is the major drainage for the 997 sq km Starkweather Watershed. While various sites were used the primary site chosen for sampling was in a 0.50 ha Type IV wetland that normally contains water throughout the year. Although measurements were taken from 1976 through 1979, weather conditions such as drought made runoff sampling difficult. Various factors assessed include: changes in concentrations of substances in runoff with time following drainage, changes in soil nitrogen and phosphorus with time following drainage, trends in concentrations of dissolved and particulate substances both upstream and downstream, and measurements of major anions, cations, seston, conductivity, and pH. Only the results for phosphorus and nitrogen are given; other results are given by De Groot (1979). Results show that the greatest release of nitrogen and phosphorus from drained wetland basins occurs in about the first four years after drainage. High levels of nitrogen in runoff waters from areas of intensive agricultural practice were found in contrast to low levels of nitrogen in grassland runoff areas. These results support the theory that once perennial vegetation is established in a drained wetland only small losses of nitrogen occur unless excessive grazing is permitted. (Seigler-IPA)

NUTRITIONAL COMPOSITION OF WATER HYACINTHS GROWN ON DOMESTIC SEWAGE,
National Space Technology Labs., NSTL Station, MS.
B. C. Wolverton, and R. C. McDonald.
Economic Botany, Vol 32, No 4, p 363-370, October-December 1978. 1 Fig, 9 Tab, 24 Ref.

Descriptors: *Aquatic weed control, *Water hyacinth, *Waste water disposal, *Beneficial use, Aquatic weeds, Nutrients, Eichornia crassipes, Proteins, Feeds, Feed lots, Adsorption, Absorption, Foods, Plant tissues, Fibers(Plant), Waste water treatment.

A nutrient analysis of water hyacinths grown in sewage wastewater was conducted. Plants (Eichornia crassipes) from different sampling locations were found to contain fairly constant amounts of fat, fiber, and ash. However, phosphorus content and crude protein varied considerably among the sampling sites. Direct correlation was found between nutrient loading rate and crude protein content of the water hyacinths. At the highest nutrient loading rates, the difference in percent crude protein was less pronounced, indicating that plant protein reached a maximum level. Most of the phosphorus (66%) was concentrated in the leaves and stems. Other plant constituents also showed some partitioning within the plant tissue. For example, leaves contained the highest percentage of crude protein and the lowest percentage of ash. The stems contained the largest portion of plant fiber. The amino acids content of water hyacinth leaves compares favorably with that of soybean and cottonseed meal. Mineral and vitamin concentrations also showed partitioning within various plant tissues. Iron, copper, and sulfur were concentrated in the roots, while magnesium was concentrated in the leaves. No toxic levels of lead, silver, cadmium, or chromium were detected in the leaf tissue. The roots contained over 50 times the amount of vitamin B12 present in the leaves. Water hyacinth could be an excellent source of proteins, vitamins, and minerals, and could be of particular value as a dietary supplement in countries where human diets are deficient in these nutrients. WATER USE AND SUPPLY DEVELOPMENT PLAN--EXECUTIVE SUMMARY.
South Florida Water Management District, West Palm Beach.
June 1978. 40 p, 16 Fig, 10 Tab.

Descriptors: *Water supply, *Water quality, *Water resources, *Water use, *Florida, *Planning, *Water management(Applied), Water demand, Water development, Administration, Wastewater reuse, Irrigation, Demineralization, Salinity, Aquifers, Water storage, Water conservation.

This plan was prepared by the South Florida Water Management District (SFWMD), an agency having water quality and quantity management responsibility for 14 southernmost Florida counties. Largely a flat area with subtropical vegetation and sawgrass, the SFWMD experiences its driest months from November through May, with water supply lowest during February. Major water uses are municipal, agricultural irrigation, Everglades National Park use, self-supplied industrial, power development, and salinity control. Consideration is given to the multiobjective approach to water resources management, whereby water supply must be managed so as to meet adequately the needs of economic development, environmental protection, drainage, flood control, and water storage. Recommendations for district water management include: encouraging better water conservation through practice and public education; supporting the development of wellfields and backpumping of the lower East Coast canals; implementation of regional demineralization facilities; deep acquifer storage and increased storage in Lake Okeechobee; wastewater reuse through support of local government and utility efforts; and support of U.S. Corps of Engineers study on wastewater reuse as an alternative water supply source. The rationale for each recommendation is presented, along with specific concerns, implementation and local action. (Arnold-NC)

4B. Groundwater Management

THE LONG ISLAND EXPERIENCE WITH WATER RETENTION AND RECHARGE MANAGEMENT,
Geological Survey, Syosset, NY. Water Resources Div.
D. A. Aronson.
In: Managing the Demand for Recreation and Tourism: Proceedings of workshop held in Ocean City, Maryland, September 27-29, 1978. Co-sponsored by the Cooperative Extension Services of Delaware, Maryland, New Jersey and Virginia, p 48-51, 1978. 12 Ref.

Descriptors: *Groundwater recharge, *Retention, *Artificial recharge, *Reclaimed water, *Water supply, Water storage, Water table, Storm runoff, Watersheds(Basins), Controlled drainage, Infiltration, Recreation, New York, *Long Island(NY).

Ground water is the sole source of freshwater for the residents of Nassau and Suffolk Counties on Long Island, N. Y. The ground-water reservoir is recharged only by local precipitation seeping from the land surface to the water table. Rapid urbanization of Nassau County caused a reduction of natural recharge as storm runoff from paved surfaces was carried to coastal waters through storm sewers. In 1935, Nassau County began to construct large basins to impound storm water and to return it to the ground-water reservoir by infiltration through underlying deposits. The use of storm-water basins not only helps to conserve storm runoff and to augment the freshwater reservoir, but it also has eliminated the need for long, costly trunk storm sewers to carry storm runoff to tidewater. Storm-water basins on Long Island are open pits excavated in permeable sand and gravel deposits of glacial origin. Basins dispose mostly of storm runoff from residential, industrial, and commercial areas and from highways. At present (1978), more than 2,500 storm-water basins are in operation in Nassau and Suffolk Counties. (Kosco-USGS)

AQUIFERS IN WALWORTH COUNTY, SOUTH DAKOTA,
Geological Survey, Garden City, KS. Water Resources Div.
J. Kume.
South Dakota Geological Survey Information Pamphlet No 18, 1979. 4 p, 3 Fig.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water quality, *South Dakota, Water yield, Water wells, Pumping, Water utilization, Aquifer systems, Walworth County(S Dak).

The water in four glacial-outwash sand and gravel aquifers in Walworth County, South Dakota, generally is of suitable quality for domestic, stock, municipal, and irrigation use. The Grand aquifer underlies about 106 square miles, averages 39 feet in thickness, and may yield as much as 600 gallons per minute to a pumping well. Three smaller aquifers composed of glacial-outwash sand and gravel, yield from 30 to 400 gallons per minute to individual wells. The Java sand and gravel aquifer consists of glacial outwash and preglacial stream sediment. The aquifer underlies about 100 square miles, averages 22 feet in thickness, and may yield as much as 50 gallons per minute to a pumping well. The Dakota and Fall River sandstone aquifers are the major bedrock aquifers that underlie the area. The Dakota aquifer is about 130 feet thick at an average depth of 1,940 feet. Its water is of the sodium chloride type. The Fall River aquifer ranges in thickness from about 140 to 200 feet at an average depth of 2,100 feet. Its water is of the calcium sulfate type. Water from these bedrock aquifers is used for domestic and stock purposes, but is too highly mineralized to be suitable for irrigation. (Kosco-USGS)

HYDROGEOCHEMICAL PROCESSES AFFECTING THE MIGRATION OF RADIONUCLIDES IN A FLUVIAL SAND AQUIFER AT THE CHALK RIVER NUCLEAR LABORATORIES,
National Hydrology Research Omst/. Ottawa (Ontario).
R. E. Jackson, and K. J. Inch.
NHRI Paper No 7, Scientific Series No 104, 1980. 58 p, 33 Fig, 25 Tab, 85 Ref, 1 App.

Descriptors: *Hydrogeochemical controls, *Radionuclides, *Groundwaters, *Aquifers, *Sediments, *Radioactive wastes, *Minerals, Migration, Adsorption, Treatment processes, Radioactivity.

In the mid-1950s, two experimental disposals of liquid radioactive waste containing approximately 700 curies (Ci) of 90Sr and 137Cs were made into shallow pits dug into the sandy ground of one of the disposal areas at the Chalk River Nuclear Laboratories (CRNL). The disposal area is part of the recharge area of a shallow groundwater flow system of approximately 1 km in length containing two aquifers-the Middle and Lower Sands units. In the past 25 years, the radioactive wastes have migrated into both aquifers and have chromatographically separated into 90Sr and 137Cs plumes. These plumes are moving at characteristic velocities much less than the velocity of the transporting groundwater. For 90Sr, this characteristic velocity is 3% of that of groundwater; for 137Cs, it is about 0.3%. The objectives of this study are (1) to investigate the hydrogeochemical controls on the migration of sampling, preservation and analysis of contaminated groundwaters and aquifer sediments. For studies of groundwater quality or pollution it is concluded that EH measurements should be complemented with measurements of dissolved oxygen and sulphide, since these can give an independent assessment of the redox level of a groundwater. Three distinct redox zones seem to exist in the groundwater flow system-oxygen, iron manganese and sulphide. The mobility of multivalent transition metals and nonmetals varies in these zones. REFLECTIONS ON GROUND WATER MANAGEMENT,
California State Water Resources Control Board, Sacramento.
W. D. Maughan.
Irrigation Journal, Vol 30, No 1, p 50, January-February, 1980.

Descriptors: *Ground water, *Water management(Applied), Overdraft, Arid lands, Ground water mining, Local governments, Imported water, Adjudication procedure, Water rights.

Lack of ground water management in many basins has led to water level decline and the threat of overdraft, subsidence, water quality deterioration and loss of wells and aquifers. In some basins this trend has been reversed by the establishment of a local ground water management program. In other basin, local capabilities are inadequate to recover from overdraft and the only solutions are adjudication of water rights or intentional mining. For large basins, importation is thought to be the best solution but may take years to implement due to entangling litigation, interstate negotiations, and construction. It is practicable for private, local, and state roles in ground water management to be worked out satisfactorily, provided new concepts and principles are jointly developed. A formula should be developed and used within the next three to five years, if real serious consequences are to be avoided. (Purdin-NWWA)

4C. Effects On Water Of Man's Non-Water Activities

EFFECTS OF WOOD PRODUCTS HARVEST ON FOREST SOIL AND WATER RELATIONS,
Northeastern Forest Experiment Station, Parsons, WV. Timber and Watershed Lab.
J. H. Patric.
Journal of Environmental Quality, Vol 9, No 1, p 73-80, January-March 1980. 4 Fig, 10 Tab, 31 Ref.

Descriptors: *Forests, *Forest watersheds, *Clear-cutting, *Appalachian Mountain region, *West Virginia, Erosion, Water quality, Runoff, Watersheds(Basins), Forest management, Effects, Sediments, Suspended solids, Dissolved solids, Water temperature, Streamflow, Reforestation, Vegetation regrowth, Forestry, Hydrology.

The effects of silvicultural treatments on streamflow have been evaluated for 20 years on a 34.7-ha forested catchment on the Fernow Experimental Forest, near Parsons, in north-central West Virginia. Selection harvest of 13, 8, and 6% of the basal area in 1958, 1963, and 1968, respectively, had negligible effect on any measured property of water. In 1969-1970, 31.7 ha were harvested by clear-cutting, leaving a 3.0-ha protective strip of lightly cut forest extending about 20 m along both sides of the stream channel. This treatment had no effect on stormflow or stream temperature, but water yield increased 253 mm (38%) during the first year after cutting. Concentrations of sediment, nitrate, calcium, magnesium, potassium, and sodium in streamflow increased slightly. These effects on water quality were held to low levels by the protective strip and prudent management of logging roads. Subsequent cutting of the protective strip and clearing the stream channel in 1972 increased water yield 40 mm (9%) and raised stream temperature as much as 7.8C. Luxuriant regrowth over the entire watershed reduced all effects on water within 2 years after each treatment, and no effect from any treatment was measurable after 1977. (Sims-ISWS)

URBAN HYDROLOGY IN KARST AND WATER QUALITY--INORGANIC AND ORGANIC SYSTEMS,
Indiana Univ. at Bloomington. Water Resources Research Center.
R. V. Ruhe, D. W. Clark, and M. L. Epstein.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-174303, Price codes: A07 in paper copy, A01 in microfiche. Report of Investigations No 9, March 1980. p 139, 28 Fig, 23 Tab, 27 Ref, 2 Append. OWRT-C-7681 (No 7256)(3), 14-34-0001-7256.

Descriptors: *Storm runoff, *Water quality, *Urbanization, *Karst, Rainfall, Runoff, Flow duration, Response time, Impervious cover, *Inorganic components, Dissolved load, Particulates, *Organic compounds, Modeling, Urban hydrology, *Pollutants, *Bloomington, Indiana, *Volatile compounds, *Non-volatile compounds, Paraffinic acids, Pesticides, Polychlorinated biphenyls.

Storm runoff and water quality were studied in ten watersheds with little to increasingly greater urbanization in karst terrain in the Bloomington, Indiana area. Among rainfall, storm runoff, flow duration, and response time, total storm flow relates best to, and directly to total rainfall. This effect increases as impervious cover increases among the watersheds whose characteristics include size, cover, slope, drainage lengths, and density. Storm peak discharge increases as size increases. Duration of storm runoff and response time decrease as impervious cover increases. Karst complicates the system. Storm runoff in one watershed is transferred underground and causes delayed high stream flow in another watershed. Some inorganic components in the dissolved load decrease with increased storm discharge but others increase as particulates increase. Effluent from the

sanitary waste facility and runoff from streets and parking areas cause concentrations above normal of some components in dissolved and particulate loads in receiving waters. Storm runoff contains many volatile organic compounds and paraffinic oils, polycyclic aromatic hydrocarbons, fatty acids, pesticides, and polychlorinated biphenyls among non-volatile compounds. During storm runoff, patterns of concentrations of inorganic and organic compounds in hydrographs are very complex. Generalizations lead to over-simplification and perhaps meaningless modeling.

Descriptors: *Aquatic environment, *Biological communities, *Limnology, *Environment effects, Pollutant identification, Water quality, Reservoirs, Surface waters, Diatoms, Periphyton, Chlorophyll, *Montana, Hyalite Reservoir(Mont), Hyalite Creek(Mont), Bozeman Creek(Mont), Southcentral Montana, Deep-water discharge, Logging activities, Cattle grazing, Aphanizomenon flos-aquae.

Physical, biological and chemical parameters were studied at three sites from May 18 to October 16, 1976, to develop limnological data for Hyalite Reservoir in Southcentral Montana. Physio-chemical parameters and periphyton dynamics were investigated at a number of sites on three creeks in the vicinity of Bozeman, Montana, to evaluate impacts on water quality from (1) deep-water discharges, (2) logging activities, and (3) cattle grazing. Nutrient concentrations were greatest near the reservoir outlet and were strongly influenced by wind action and the deep-water discharge. Highest chlorophyll-a concentrations and primary production occurred nearest the dam. An Aphanizomenon flos-aquae bloom in the reservoir appeared to result from low nitrogen and carbon dioxide concentrations. Primary production in the reservoir and at stream sites was also nitrogen limited. Reservoir discharges releasing nitrogen stimulated periphytic productivity, improved the physiological condition of the primary producers and increased diatom species diversity. Logging activities had no apparent impact on periphyton; cattle grazing increased periphytic productivity and decreased diatom diversity. Toxins released from old growths on diatomers and low water temperatures appear to inhibit periphyton growth. (Hunt-Mont)

STORM WATER MANAGEMENT MODEL VERIFICATION - HAMILTON TEST CATCHMENT.
Gore and Storrie Ltd, Toronto (Ontario).
Environmental Protection Service, Ottawa, Ontario, Training and Technology Transfer Division (Water). Canada-Ontario Agreement on Great Lakes Water Quality, Research Report No 99, 1980. 92 p, 31 Fig, 11 Tab, 12 Ref. 74-8-6.

Descriptors: *Water quality, *Watershed topography, *Rainfall rate, *Runoff quality, *Pollutants, Data collections, Quality simulation models, Sewer systems, Hydrographs, Great Lakes, Ontario, Canada.

A residential test catchment in Hamilton, Ontario, was selected and equipped with a data acquisition system for the collection of rainfall data, and quantity and quality urban runoff data. The test catchment was served by a combined sewer system and comprised an area of 71 ha (176 acres). The hydrologic and physical characteristics of the watershed, the criteria adopted for the selection of the instrumentation system, its installation and the data collection procedure used are described. The results of data analysis and the calibration and verification results of the U.S. Environmental Protection Agency's Storm Water Management Model (SWMM) are discussed in detail and are presented in tabular and graphical forms. These results confirmed the reliable performance of the SWMM runoff quantity model as indicated by the reasonable agreement of the simulated hydrographs with observed values. On the other hand, the quality model used did not produce acceptable correlation between measured and simulated pollutographs when calibration was attempted on an event basis for some pollution parameters. ANALYSIS OF RIVERS AND STREAMS OF SOUTHERN MISSOURI FOR EPA PRIORITY POLLUTANTS USING LIQUID CHROMATOGRAPHY,
Missouri Univ.-Rolla.
J. O. Stoffer, and C. M. Ratkey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-173560, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Center, University of Missouri, Completion Report, March 1980. p 30, 6 Fig, 4 Tab, 10 Ref. OWRT A-104-MO(1), 14-34-0001, 8027, 9027.

Descriptors: *Water analysis, *Pollutants, *Organic compounds, *Waste water(Pollution), Watersheds(Basins), Missouri, Southern Missouri, Analytical techniques, Benzene, Carbon tetrachloride, Chloroform, Vinyl chloride, Bromoform, Pentachlorophenol, P-dichlorobenzene, PCB, 1, 1, 2-trichloroethylene, Organic pesticides, 3, 4-benzpyrene, Atrazine, Roundup, Lasso, Sencor, Paraquat.

The authors compare two methods of trace enrichment of organic pollutants likely to be found in rivers, streams and wastewater of Southern Missouri. Recovery data indicates sub parts per billion concentration levels are detectable with one method while a 15 minute on site enrichment at the sub parts per million level is possible with the other method. Various means of identification along with their lower concentration limits are also discussed. Among these identification methods discussed are GC/MS/DS, conventional U.V. analysis, rapid scan U.V. spectrophotometry, and high pressure liquid chromatography with data handling capabilities. The results of analysis of river water samples showed remarkably clean conditions prevail in the remote southern Missouri streams. Compounds tentatively identified include phthalates, phenols, branched hydrocarbons, and chlorinated hydrocarbons along with other more complex compounds. Variations in liquid chromatograms using the two different methods were noted. These variations can be attributed to differences in the work-up procedure and to the amount of sediment present in the water sample. Overall reproducabilities for the two methods are tabulated and show consistent recoveries with linear response to change in concentration.

Descriptors: *Phytoplankton, *Measurement, *Particle size, *Growth rates, *Detritus, Size, Equations, Estimating, Estimating equations, Mathematical studies, Biomass, Curves, Methodology, Analytical techniques, Diurnal, Microscopy, Sampling, Organic matter, Diatoms.

Phytoplankton growth rates can be measured in natural waters by particle counting, but experimental procedures are not routine. Each experiment has to be carefully planned and diurnal growth variations must be recognized. Asymptotic approximations cannot be used. Attention should be given to several points: (1) Growing material must be identified either with microscopes or by chemical determinations. (2) The size range over which growth occurs is identified on a size spectrum. Over a restricted size range phytoplankton grows essentially free of detritus, exhibiting an exponential growth pattern. (3) Experimental error must be minimized. Sample variation is reduced when all samples are taken from one large bottle. Large counts minimize counting errors. (4) Enough samples must be taken to define growth patterns; different experiments must take place. A preliminary run determines what is growing and the size range. In a second experiment, diurnal growth variations are established. Finally, a third experiment checks long-term growth patterns. Methods described by Cushing and Nicholson have produced obvious anomalies in past experiments due to the mathematical form of growth relationships. In phytoplankton growth studies in Bedford Basin, Nova Scotia, particle counting of a diatom bloom measured 15 March 1976, indicated that particulate matter was 99% detritus and 1% phytoplankton. Those growth constants best fit an asymptotic function. This shows that in practical terms, estimating phytoplankton growth by particle counting is not possible either by curve fitting or by Cushing and Nicholson methods. (Danovich-Wisconsin)

QUANTIFICATION OF NON-POINT WATER POLLUTANTS FROM LOGGING, CATTLE GRAZING, MINING, AND SUBDIVISION ACTIVITIES,
Montana State Univ., Bozeman. Dept. of Microbiology.
J. E. Schillinger, and D. G. Stuart.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-174063, Price codes: A16 in paper copy, A01 in microfiche. Montana Water Resources Research Center. Montana State University Report No 93, 1978. 366 p, 97 Fig, 59 Tab, 319 Ref, 2 Append. OWRT-C-7054 (No 6207)(1), 14-34-0001-6207.

Descriptors: *Water quality, *Watersheds(Basins), Streamflow, Monitoring, *Water pollution sources, Stream pollution, Water chemistry, Bioindicators, Sediment, *Grazing, *Mining, *Logging(Lumber), *Urban runoff, Suburban areas, Geology, Storm runoff, Snowmelt, Elevation, Gradient(Stream), *Land use, Temperature, Conductivity, Turbidity, Alkalinity, Ammonia, Calcium, Chlorides, Magnesium, Nitrates, Nitrites, Potassium, Sodium, Sulfates, Bozeman Creek, Hyalite Creek, Gallatin County, Montana, Non-point source, Cattle grazing index, Clearcutting, Fecal coliforms, Fecal streptococci, Orthophosphate, Standard plate count, Enterobacter, Klebsiella, Leptospiria, Multiple regression, Factor analysis.

Water quality data were collected over a two-year period in at 57 points in the Hyalite Creek and Bozeman Creek watersheds in southwestern Montana to determine the contribution of different activities to changes in the water chemistry, suspended sediment levels, and bacterial indicator count in streamflow. Cattle grazing increased fecal coliform; a cattle grazing index is formulated and correlated with the fecal coliform concentration and is shown as a function of a grazing management rating to relate a cattle management system to water quality. Clearcut logging did not significantly effect water quality. Although soil erosion occurred in clearcut areas, little sediment reached the streams from disturbances more than 30m away. Stormwater runoff, septic tank drainfields and construction in subdivisions in urban and suburban areas significantly altered the bacteriological and chemical quality and amount of suspended sediment in stream. Effects of groundwater seeping through a lead mine operated intermittently adjacent (300m) to stream were insignificant on water quality. A factor analysis indicates natural processes (1) correlate significantly with changes in water quality in high mountain streams than logging and grazing, and (2) do not correlate significantly in urban and suburban developments. Bacteriological analysis indicates Klebsiella and Enterobacter may indicate pollution from storm sewers and septic tanks better than total coliform. Methods for in situ and in vitro examination of leptrospires are presented.

OXYGEN CONTENT AND TOXICITY FOR FISH OF SOME SUBSTANCES IN HEATED WATERS,
Institute of Meteorology and Water Management, Warsaw (Poland). Dept. of Water Economics.
M. Gadkowski, A. Lysak, and B. Kokurewicz.
Polish Ecological Studies, Vol 5, No 3, p 18-23, 1979. 1 Tab.

Descriptors: *Toxicity, Water pollution effects, *Phenol, *Zinc, *Copper, *Cadmium, *Mercury, *Water temperature, Cooling water, Electric power production, Electric power plants, Poland, Freshwater fish.

The heating of river waters by an electric power plant do not deteriorate the oxygen balance of the river. The effect of increased water temperature on the toxicity of phenols, zinc, copper, cadmium, mercury as indicated by the literature is inconclusive and not consistent. It is suggested that long term studies be conducted to determine the long range effects of toxicants on fish in heated waters. (Katz-EIS)

LETHAL TEMPERATURES FOR FISH,
Instytut Rybactwa Srodladowego, Warsaw (Poland). Heated Waters Lab.
L. Horoszewicz.
Polish Ecological Studies, Vol 5, No 3, p 24-32, 1979. 7 Fig.

Descriptors: *Water pollution effects, *Water temperature, Electric power plants, Freshwater fish, *Poland, *Vistula River(Poland), *Atlantic salmon, *Lethal temperatures, Bass, Pike, Perch, Acclimation, Temperatures, Catfish, Carp, Cyprinids.

Comparison of lethal temperatures for fish occurring in the mid- and low course of the Vistula River with predicted temperatures after heating of these sections leads to the hopeful conclusion that even maximal predicted temperatures will not be the immediate cause of mortality of fish moving freely in the heated environment. Mortality can take place in the case of sudden occurrence of extreme temperatures exceeding 34C, or in the case of carrying fry and juveniles by the current from unheated sections of the river. Stream-like discharge of warm water that is maintaining an unheated current along one of the banks is of basic significance for survival of the most valuable fish populations in our waters - migrating salmonid fish species - the Atlantic salmon, Salmo salar L. and the sea-trout, S. trutta L. (Katz-EIS)

FISH METABOLISM,
Institute of Applied Biology, Siedlce (Poland).
B. Jezierska.
Polish Ecological Studies, Vol 5, No 3, p 43-51, 1979. 6 Fig.

Descriptors: *Fish physiology, *Fish behavior, *Water temperature, *Vistula River(Poland), *Poland, Metabolism, Water pollution effects, Cooling water, *Thermal effluents, Salmon, Cold water fish, Warm water fish, Fresh water fish, Brown trout, Catfish, Dissolved oxygen, Critical oxygen content.

Heating of the aquatic environment results in an increase of the rate of metabolism in fishes, this being related to increased activity and higher rate of basic physiological processes. Rate of standard metabolism can become even twice higher in conditions predicted by the model of the effects of heated effluents on water temperatures in the Vistula River. When the temperatures exceed 28-30C and oxygen content falls below 6 mg/l, some disorders in metabolic processes may occur, such as decrease of gas exchange rate, 'anaerobic respiration', and their consequences for the organism. Changes of the temperature and of the oxygen content which do not exceed the above range usually result in an adaptation to the heated environment of most freshwater fish species of interest to this study. The longer the period of altered environment the more thorough is adaptation of fish to the conditions, although the character of adaptive changes affects also fish organism as such. This may result in a development of a new 'variety' of fish adapted to new environmental conditions. (Katz-EIS)

FEEDING OF FISH AND THEIR FEEDING GROUNDS,
Instytut Rybactwa Srodladowego, Piaseczno (Poland).
T. Backiel.
Polish Ecological Studies, Vol 5, No 3, p 72-79, 1979. 4 Fig.

Descriptors: *Fish physiology, *Fish diets, *Vistula River(Poland), Poland, Cooling water, *Thermal effluent, Aquiculture, Benthos, Sediments, Zooplankton, Channel morphology, Channel improvement, Backwater, Backwater areas, Fresh water fish, Water temperature, Warm water fish.

Material carried by the water (drift) will be reduced in proportion to the amount of water taken by the power plant. Thus, for example, the average water intake by the Kozienice electric power plant is only around 6.4% of the average flow and it can be expected that less than 6% of the live components drifted is destroyed. At low water levels and maximal output of the power plant this effect may be around 2.5 times higher, but even then the influence of the plant on this ground is only slight. Due to narrowing of the river bed and due to embankments in the region of any power plant and, consequently, acceleration of the current, the number of feeding grounds developing on a hard river bottom will increase. Such feeding grounds within the range of a warm water stream will become more abundant. Feeding grounds of silted, muddy bottom within the range of a warm water stream may become poorer. The influence of such a warm water stream on closed backwater areas, if any are left (see below), is significant. It is difficult to predict the changes in zooplankton, but one can assume that the benthos will undergo unfavourable changes, while vegetation and its accompanying fauna will show exhuberant development. About twofold increase of food requirements may not be met with by fish feeding on the muddy bottom, but will most likely be satisfied by fish grazing on fauna which develops on hard objects in the river channel. (Katz-EIS)

THE IMPACT ON ICHTHYOFAUNA AND POSSIBLE CONTROL OF THE EFFECTS OF THERMAL DISCHARGE,
Instytut Rybactwa Srodladowego, Piaseczno (Poland).
T. Backiel, M. Gadkowski, and L. Horoszewicz.
Polish Ecological Studies, Vol 5, No 3, p 100-107, 1979. 1 Fig, 2 Tab.

Descriptors: *Water pollution effects, *Aquiculture, *Vistula River(Poland), *Poland, Water temperature, Monitoring, *Fish population, Thermal powerplants, Growth, Fish reproduction, Fish diets, Fish behavior, Fish physiology.

The series of papers are briefly synthesized under two main groups: (1) The predicted changes in the river environment affected by the power plant and (2) the predicted changes and the possible deleterious effects in the fish population resulting from the effects of the power plant on the river environment. Also discussed are the adaptation of fish to heated waters, the acceptable variations in water temperature and the maximum tolerated temperatures, the distribution of water temperature in the Vistula River and the changes in the river bed. The possibilities of reducing the adverse effects of heated effluents, the monitoring of fish population and the use of the effluents in fish farming. (Katz-EIS)

TISSUE METAL CONCENTRATIONS IN TWO CRAYFISH SPECIES COHABITING A TENNESSEE CAVE STREAM,
Savannah River Ecology Lab., Aiken, SC.
G. W. Dickson, L. A. Briese, and J. P. Giesy, Jr.
Oecologia, Vol 44, p 8-12, 1979. 1 Fig, 3 Tab, 32 Ref.

Descriptors: *Metals, *Crayfish, *Absorption, *Cadmium, *Chromium, *Copper, *Iron, Magnesium, Manganese, *Lead, *Zinc, Calcium, Potassium, Toxicity, Mortality, Animal behavior, Fecundity, Life History Studies, *Tissue analysis, *Bioaccumulation, Tennessee, White County(Tenn).

Concentrations of Cd, Cr, Cu, Fe, Mg, Mn, Pb, Zn, Ca and K were examined in tissues of the troglobitic (obligatory cave-dwelling) crayfish Orconectes australis australis and troglophilic (facultative cave-dwelling) species Cambarus tenebrosus. These two species cohabit a stream in Merrybranch Cave, located in rural White Co., Tennessee. Tissue concentrations of essential metals did not exhibit any trends between species. In contrast, Cd and Pb concentrations were found to be significantly greater in O. australis for almost all of the tissues analyzed. The higher Cd and Pb concentrations in O. australis are thought to be due to the increased longevity of this troglobitic species. Because of the toxicity of Cd and Pb, chronic exposure to relatively low concentrations of these

metals could cause changes in mortality, fecundity or behaviour in aquatic organisms possessing long life spans. The bioaccumulation of metals from low level, non-point sources is discussed in relation to life history strategies. (Deal-EIS)
W80-04696

TOXICITY OF BUTOXYETHYL ESTER OF 2,4-D TO SELECTED SALMON AND TROUT,
International Pacific Salmon Fisheries Commission, New Westminster (British Columbia).
D. W. Martens, R. W. Gordon, and J. A. Servizi.
Progress Report No 40, 1980. 18 p, 1 Fig, 5 Tab, 13 Ref.

Descriptors: *2,4-D, *Bioassay, *Salmonids, *Toxicity, Sockeye salmon, Pink salmon, Rainbow trout, Fry, Growth stages, Pesticide toxicity, Lethal limit, Mortality, Chemical properties, Pesticide kinetics, Microbial degradation, *Aqua-Kleen.

Sockeye, coho and pink salmon and rainbow trout were exposed to butoxyethyl ester of 2,4-D (BEE) derived from Aqua-Kleen 20 in semi-static acute and chronic bioassays. The 96 hr LC50 was approximately 0.45 mg/l BEE for sockeye fingerlings, coho fry and pink fry. Rainbow trout were slightly more sensitive to BEE than the salmon tested. Sockeye smolts and pink salmon fry survived transfer to seawater after 24 hour exposure to concentrations of BEE nearly equal to the 96 hr LC50. Pink and coho salmon and rainbow trout were shorter than control specimens at yolk absorption following exposure to 0.220 mg/l BEE during the alevin stage. No mortality or distress was observed among sockeye fingerlings exposed to 200 mg/l 2,4-D acid for 168 hours. The influences of bacterial activity, temperature and pH on bydrolysis of BEE to 2,4-D acid are discussed. (Deal-EIS)

PRODUCTION, MORTALITY, AND POWER PLANT ENTRAINMENT OF LARVAL YELLOW PERCH IN WESTERN LAKE ERIE,
Environmental Research Lab. Duluth, MN.
R. L. Patterson.
Report EPA-600/3-79-087, 1979. 199 p, 45 Fig, 40 Tab, 7 App, 23 Ref.

Descriptors: *Powerplants, *Entrainment, *Yellow perch, *Mortality, *Lake Erie, Growth stages, Larval growth stage, Perches, Fish populations, Fish management, Mathematical models, Monroe Power Plant(Mich), *Impingement.

This study assessed impacts of the Monroe Power Plant upon the yellow perch population of Western Lake Erie caused by entrainment and impingement of larvae and older fishes in the plant's open cycle cooling system in 1975-76. Estimates of total numbers of perch larvae entrained, total perch production, the natural mortality rate of perch, and the percentage of perch production that was entrained by the Monroe Power Plant were obtained for 1975-76. Impingement estimates were obtained from data supplied by the power plant. The above estimates consider only effects that occur in the same year in which entrainment and impingement occurs. Impacts may occur in subsequent years which include a depression of fish stocks and reduced yields to the fishery. Losses to the standing stocks and fisheries were estimated using a method which falls into a category known as the 'equivalent-adult' type which provided estimates of the long-run annual depression of yellow perch standing stocks and the yellow perch fisheries. A numerical model was developed which incorporated several population parameters including entrainment and impingement losses, and natural mortality rates for larvae, young-of-year and juveniles, and fishing mortality rates. TOXIC DINOFLAGELLATES AND TIDAL POWER GENERATION IN THE BAY OF FUNDY, CANADA,
Institute for Marine Environmental Research, Plymouth (England).
P. C. Reid.
Marine Pollution Bulletin, Vol 11, p 47-51, 1980. 2 Fig, 34 Ref.

Descriptors: *Dinoflagellates, *Algal toxins, *Tidal energy, *Tidal powerplants, *Shellfish, Poisons, Tides, Flow profiles, Water circulation, Powerplants, Sedimentology, *Paralytic Shellfish Poisoning, *Bay of Fundy(Canada), Public health.

The incidence of Paralytic Shellfish Poisoning along the eastern seaboard of America has increased and spread during the last decade. One of the core areas for Paralytic Shellfish Poison (PSP), a poison that is derived from toxic dinoflagellates, is centred on the Bay of Fundy. It is in the upper reaches of the Bay of Fundy that a proposal has been made to construct a tidal power generation plant; this project would have a considerable effect on the water circulation, tidal regime and sedimentation characteristics of the Bay of Fundy and Gulf of Maine. Alterations such as these to the hydrography of this area may lead to changes in the occurrence of toxic dinoflagellates and the associated patterns and intensity of PSP. (Deal-EIS)

A SIMPLE CONTINUOUS-FLOW TOXICANT DELIVERY SYSTEM,
Corvallis Environmental Research Lab., OR.
R. R. Garton.
Water Research, Vol 14, p 227-230, 1980. 3 Fig, 2 Tab, 3 Ref.

Descriptors: *Research equipment, *Bioassay, *Methodology, Laboratory equipment, Equipment, *Toxicity, Water chemistry, Research and development, Chemical analysis, Chemical properties, *Aquatic organisms.

This paper describes a simple continuous-flow toxicant delivery system for use in testing toxicity of dissolved or suspended compounds to aquatic organisms. Its advantages are simplicity, ease of construction, and capacity for high flow rates. The system consists of a glass headbox and diluter box, a toxicant pump, a framework for support, and a system of tubes to deliver a series of toxicant concentrations to the test aquaria. Methods are given for construction and for calibration of the system. (Deal-EIS)

COMPARISON OF THE TOXICITY THRESHOLDS OF WATER POLLUTANTS TO BACTERIA, ALGAE, AND PROTOZOA IN THE CELL MULTIPLICATION INHIBITION TEST,
Bundesgesundheitsamt, Berlin (Germany, F. R.). Inst. fuer Wasser-, Boden-, und Lufthygiene.
G. Bringmann, and R. Kuhn.
Water Research, Vol 14, p 231-241, 1980. 10 Tab.

Descriptors: *Bioassay, *Methodology, *Water pollution effects, Chemical properties, Protozoa, Bacteria, Algae, Pseudomonas, Scenedesmus, Chlorophyta, Growth rates, Inhibition, Organic compounds, Aromatic compounds, Phenols, Inorganic compounds, *Toxicity.

Using analogous methods of the cell multiplication inhibition test, the toxicity threshold (TT) of 156 potential water pollutants was determined for model organisms of biological self-purification, i.e. bacteria of the species Pseudomonas putida, green algae of the species Scenedesmus quadricauda, and flagellate protozoa of the species Entosiphon sulcatum. From the number of 156 inorganic and organic pollutants tested, 23 exhibited a pronounced selective toxic action on Pseudomonas, 47 on Scenedesmus and 43 on Entosiphon. It is seen from the ratios found that a determination of the toxicity threshold of potential water pollutants for these three model organisms from the microbiological spectrum would provide a broader basis for assessing the damaging action of water pollutants to model organisms active in the biological self-purification of water. Ecotoxicological testing of potential water pollutants to evaluate their toxicity involving only one model organism of biological self-purification would give an incomplete and biased picture of the effects of pollutants. (Deal-EIS)

A PRESSURIZED PROPORTIONAL DILUTER FOR AQUATIC TOXICOLOGICAL STUDIES,
Environmental Research Lab., Gulf Breeze, FL.
M. J. Hemmer.
Water Research, Vol 14, p 243-246, 1980. 3 Fig, 1 Tab, 6 Ref.

Descriptors: *Research equipment, *Bioassay, *Toxicity, *Aquatic organisms, Siphons, Equipment, Laboratory equipment, Chemical reactions, Pumps, Chemical analysis, Methodology, Shrimp, Endrin.

A halt-liter proportional diluter using positive pressure was designed and tested. Its primary siphons are activated by a pulse of pressure instead of by a partial vacuum as in conventional diluters. This method eliminates the need for venturi tubes, vacuum manifolds, and individual water blocks. Pressure can be supplied by air pumps, air cylinders, or air compressor lines. The diluter's advantages are ease of construction, calibration, compact size, and rapid cleaning. Unit cost is approximately $250.00. (Deal-EIS)

CORRELATION AND PREDICTION OF METAL TOXICITY TO AQUATIC BIOTA,
National Water Research Inst., Burlington (Ontario).
K. L. E. Kaiser.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 37, p 211-218, 1980. 6 Tab, 24 Ref.

Descriptors: *Physioc-chemical properties, *Metals, *Ions, *Toxicity, *Daphnia, Aquatic life, Sodium, Aluminum, Chromium, Manganese, Iron, Cobalt, Nickel, Copper, Zinc, Cadmium, Mercury, Lead, Mathematical studies, *Arsenic, *Selenium, *Tin, Platinum, *Gold, *Beryllium, *Barium.

Published data on the toxicity of metal ions to aquatic biota, in particular Daphnia magna, were analyzed for their correlation with ion specific physicochemical parameters. Significant correlations were obtained for three groups of ions with similar electron configurations in the outer orbitals. Group I ions include Na, Be, Ba, Al, and Cr with inert gas-like electron configurations; group II ions include Cr, Mn, Fe, Co, Ni, Cu, Zn, As, Cd, Pt,

Au, and Hg with partially or completely filled d electron orbitals; group III ions include Sn, As, Se, and Pb. The toxicity of an ion within a group can be calculated from a general equation. Delta IP. (Deal-EIS)

FACTORS CONTROLLING OXYGEN DEPLETION IN ICE-COVERED LAKES,
Department of Fisheries and Oceans, Winnipeg (Manitoba). Freshwater Inst.
J. A. Mathias, and J. Barica.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 37, p 185-194, 1980. 4 Fig, 2 Tab, 38 Ref.

Descriptors: *Lakes, *Dissolved oxygen, *Winter, Seasonal, Trophic level, Eutrophication, Oligotrophy, Winterkilling, Oxygen demand, Respiration, Sediments, Canada, *Oxygen depletion.

Winter oxygen depletion rates from four sets of Canadian lakes (prairie, southeastern Ontario, Arctic, and Experimental Lakes Area) differing in morphometry and trophic state, were analyzed. An inverse relationship was found between oxygen depletion rate and mean depth. The effect of lake trophic status on oxygen depletion rate was demonstrable after the influence of basin morphometry was removed by regression of oxygen depletion rate against the sediment area: lake volume ratio. The sediments of eutrophic lakes consumed oxygen about 3 times faster (0.23 g/sq m/d) than those of oligotrophic lakes (0.08 g/sq m/d), but water column respiration was about the same (0.01 g/cu m/d) for both groups of lakes. Data from prairie lakes showed that the winter oxygen consumption was limited by oxygen supply below an average whole-lake oxygen concentration of 3.8 mg/l. Implications for lake management during the winter are discussed. (Deal-EIS)

THREE TYPES OF SKIN PAPILLOMAS OF FLATFISHES AND THEIR CAUSES,
Hamburg Univ. (Germany, F.R.). Zoologisches Inst.
N. Peters, and B. Watermann.
Marine Ecology - Progress Series, Vol 1, p 269-276, 1979. 9 Fig, 17 Ref.

Descriptors: *Fish diseases, *Cytological studies, *Mode of action, Fish physiology, Animal pathology, Viruses, Water pollution effects, Metals, Sulfur compounds, Marine fish, *Papillomas, *Tumors, *Limanda, *Tissue analysis, *Neoplasms, Titanium compounds.

Three structurally different skin papillomas occur in flatfishes. Apparently, different causative agents are responsible. (1) Flat 'fish pox'-like tumours with a low connective tissue content occur in the Atlantic dab Limanda limanda. The high rate of occurrence in the German Bight (up to 6.6%) might be related to the dumping of wastes consisting of sulphuric acid and titanium compounds. (2) Collagen-rich papillomas on the tip of the lower jaw appear on both Atlantic and Pacific flatfishes kept in aquaria over long periods of time. These develop as a result of mechanical stimulation of the tissue as the fishes rub against aquarium walls. (3) Complex papillomas, composed in a characteristic manner of so-called X-cells and envelope cells between them, are common in flatfishes of the Pacific region. The structure and the distribution of these complex papillomas indicate that a virus is probably involved. There also exists some relationship between tumour occurrence rate and degree of coastal water pollution. (Deal-EIS)

ACUTE RESIDUAL TOXICITY OF SEVERAL DISINFECTANTS IN DOMESTIC AND INDUSTRIAL WASTE WATER,
Grand Valley State Colleges, Allendale, MI. Dept. of Biology.
R. W. Ward, and G. M. DeGraeve.
Water Resources Bulletin, Vol 16, No 1, p 41-48, 1980. 6 Tab, 20 Ref.

Descriptors: *Waste treatment, *Toxicity, *Freshwater fish, Bioassay, Chlorination, Bromine, Halogens, Chlorine, Industrial wastes, Sulfur compounds, Carp, Salmonids, Bioassay, Domestic wastes, Mortality, Benthic fauna, Disinfection, Daphnia, Minnows.

This study determined the acute toxicity of waste water disinfected with chlorine, bromine chloride, or ozone. The residual toxicity of effluent dechlorinated with sulfur dioxide was also tested. Toxicity tests were conducted with cyprinid, salmonid, and centrachid fishes, as well as several species of fresh water macro-invertebrates. Residual chlorine exhibited the greatest toxicity of the disinfectants tested; dechlorination with sulfur dioxide effectively eliminated the toxicity of chlorinated effluent. Residual ozone produced mortality in test animals only under special conditions where subjects were exposed to effluent immediately after it was contacted with ozone, and chlorobrominated effluent was more toxic to salmonids than chlorinated effluent. USING ARTIFICIAL STREAMS TO EVALUATE PERTURBATION EFFECTS ON AUFWUCHS STRUCTURE AND FUNCTION,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
J. R. Clark, J. H. Rodgers, Jr., K. L. Dickson, and J. Cairns, Jr.
Water Resources Bulletin, Vol 16, No 1, p 100-104, 1980. 3 Fig, 1 Tab, 30 Ref.

Descriptors: *Periphyton, *Biological communities, *Streams, Bioassay, Flow rates, Dominant organisms, Aquatic populations, Methodology, Research and development, Research equipment, Water pollution effects, *Artificial streams.

Artificial streams can assist in assessing the potential impact of pollutants on the structure and function of aquatic communities. While most artificial streams are constructed within a controlled environment or are maintained by recirculating water, we constructed a series of artificial streams along a river bank using river water on a once-through basis. This system was used to develop and test methods for structural and functional analyses of Aufwuchs communities. Only the flow rate and stream depth were controlled while individual streams were perturbed to obtain communities of altered ecological condition. This experimental system provided a relatively inexpensive series of treated and untreated streams which allowed an evaluation and comparison of methods using communities under various stressed and non-stressed conditions. Without the stabilizing effects of a controlled atmosphere or recirculating water, our approach demonstrated a degree of variability which approached that of the river. We inferred that the Aufwuchs community present in the artificial streams maintained a high degree of structural complexity and functional dynamism, providing a strong test of our methods and an opportunity to examine current ecological theory. GROWTH INHIBITION OF HYDRILLA VERTICILLATA BY SELECTED LAKE SEDIMENT EXTRACTS,
Southwest Florida Water Management District, Brooksville.
P. M. Dooris, and D. F. Martin.
Water Resources Bulletin, Vol 16, No 1, p 112-117, 1980. 2 Fig, 1 Tab, 29 Ref.

Descriptors: *Growth rates, *Inhibition, *Aquatic plants, *Iron, Bioassay, Lakes, Bottom sediments, Soil chemistry, Chemical properties, Chemical analysis, Plant growth, Biomass, Florida, *Hydrilla.

Sediments were investigated from two Florida lakes that have not been infested with the submersed, perennial, noxious plant Hydrilla verticillata. Aqueous extracts of the peat-like sediments from these lakes were shown to inhibit the growth of Hydrilla verticillata in laboratory systems. The extracts have substantial concentrations of organic carbor and iron. The apparent molecular weight of the inhibitory fraction is between 2,000 and 10,000, based upon ultrafiltration studies. Hydrilla growth was about 35 percent relative to control for a partially purified fraction at a level of 0.4 ppm organic carbon. Growth was measured as change in biomass (wet and dry) over a one-week period. The inhibitory material was highly fluorescent, dark brown, and inhibitory activity was lost after passage over an anion-exchange column (Cellex-D). (Deal-EIS)

EFFECTS OF DIETARY ASCORBIC ACID ON CHRONIC LEAD TOXICITY TO YOUNG RAINBOW TROUT (SALMO GAIRDNERI),
Fisheries and Marine Service, Ottawa (Ontario). Great Lakes Biolimnology Lab.
P. V. Hodson, J. W. Hilton, B. R. Blunt, and S. J. Slinger.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 37, p 170-176, 1980. 7 Fig, 27 Ref.

Descriptors: *Lead, *Toxicity, *Rainbow trout, Fish diets, Vitamins, Nutrient requirements, Mode of action, Animal pathology, Fish diseases, Fish physiology, Water chemistry, *Tissue analysis, *Blood chemistry, *Ascorbic acid.

Newly hatched rainbow trout exposed to waterborne lead and receiving diets deficient in, or supplemented with, ascorbic acid, developed classical symptoms of lead toxicity and ascorbic acid deficiency. Those exposed to lead showed elevated blood lead concentrations, inhibition of erythrocyte Delta -amino levulinic acid dehydratase, darkening of the tail regions and spinal curvatures. Those receiving ascorbate deficient diets showed depletion of carcass, liver, kidney, and brain ascorbic acid concentrations plus spinal curvatures. Fish subjected to both treatments simultaneously showed no evidence of an enhancement of ascorbate deficiency symptoms by exposure to lead or enhancement or reduction of lead toxicity symptoms by ascorbate deficient or supplemented diets, respectively. These results demonstrate that, although aspects of lead toxicity in fish resemble ascorbic acid deficiency, there is no metabolic interaction between the two factors. (Deal-EIS)

Biologische Anstalt Helgoland (Germany, F.R.).
R. R. Dawirs.
Marine Ecology-Progress Series, Vol 1, p 323-329, 1979. 12 Fig, 21 Ref.

Descriptors: *Water temperature, *Salinity, *Growth rates, *Crabs, Larval growth stage, Toxicity, Mortality, Salt tolerance, Mathematical models, Animal physiology, Water chemistry, Growth stages, Seasonal, Crustaceans.

The hermit crab Pagurus bernhardus L. was reared from egg to first crab stage at 6C, 12C and 18C. At 6C, development was completed after 107 to 112 d; at 12C, after 49 to 54 d; at 18C, after 33 to 35 d following hatching. Survival rates were 6.7% both at 6 and 18C; they were 20% at 12C. A simple graphical model was constructed which predicts occurrence, presence and settling of P. bernhardus larvae in the field. According to this model, in Helgoland waters (North Sea), duration of larval development lasts about 35 to 62 d, depending on the water temperature during and after hatching. Shortest development (about 35 d) is postulated for larvae hatching at the beginning of August. Complete rearing to metamorphosis was accomplished in 20% and 30% S (18C). In 10% S, Zoea 1 larvae exhibit 100% mortality 2 to 5 d after hatching. No differences in development duration, mortality, etc. were noticed at 20% and 30% S. The observation that a salinity of 20% does not cause recognizable stress is discussed in relation to local larval distribution. (Deal-EIS)

ACUTE TOXICITY OF HEAVY METALS TO AQUATIC INVERTEBRATES AT DIFFERENT TEMPERATURES,
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
L. P. Braginskiy, and E. P. Schcherban.
Hydrobiological Journal, Vol 14, No 6, p 78-82, 1978. 4 Tab, 9 Ref.

Descriptors: *Heavy metals, *Toxicity, *Invertebrates, *Water temperature, Cadmium, Zinc, Copper, Nickel, Manganese, Daphnia, Mayflies, Lethal limit, Bioassay, Animal physiology, Mortality, Copepods, Benthic fauna, Aquatic insects, Copepoda, Amphipods, Asellus.

Comparative toxicity of Cd, Zn, Cu, Ni, Mn ions at temperatures of 10, 15, 25 and 30C within the concentration range of 0.0025-5000 mg/liter was measured in acute 3-day experiments on six species of freshwater invertebrates. Maximum sensitivity to heavy metal ions is characteristic of Daphnia magna Straus young. Acanthocyclops viridis, Mayflies larvae and Asellus aquaticus are least sensitive. Cadmium is most toxic, followed by copper, zinc, nickel and manganese. As the temperature is raised to 25 to 30C, cadmium toxicity increases by 3 to 4 orders of magnitude, that of copper and zinc by 1 to 3 orders. (Deal-EIS)

THE STUDY OF EUTROPHICATION OF ALGAL BENTHOS BY ESSENTIAL METALS IN ARTIFICIAL RIVERS,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
E. Eichenberger.
In: Biological Aspects of Freshwater Pollution, O. Ravera, Ed., Pergamon Press, p 111-128, 1978. 4 Fig, 8 Tab, 12 Ref.

Descriptors: *Heavy metals, *Eutrophication, *Rivers, Sewage effluent, Aquatic algae, Growth rates, Productivity, *Iron, *Manganese, *Cobalt, *Copper, *Zinc, Trophic level, Seasonal, Biomass, Trace elements, Toxicity, *Molybdenum.

The causes of eutrophication of rivers are being studied in artificial outdoor rivers. Small amounts of domestic sewage added to groundwater stimulates the growth of algae. This eutrophying effect cannot be duplicated by the supply of the same quantity of P04-P and/or N03-N as is found in the active sewage. The supply of a mixture of the 6 essential heavy metals Fe, Mn, Co, Cu, Mo and Zn on the other hand does affect the growth activity of the algae occurring naturally in the channels, whereby each metal most likely has a different effect. This results, depending on the season and the amount of mixture added, in changes of the sociological composition of the algal benthos and can considerably enhance the biomass accumulation. Due to the characteristic dose response of single algal species to individual metals the role of essential heavy metals in eutrophication is likely to be rather complex. (Deal-EIS)

ACIDITY AND SPECIES DIVERSITY IN FRESHWATER CRUSTACEAN FAUNAS,
Freshwater Biological Association, Windermere (England).
G. Fryer.
Freshwater Biology, Vol 10, p 41-45, 1980. 1 Fig, 1 Tab, 7 Ref.

Descriptors: *Acidic water, *Habitats, *Crustaceans, Dominant organisms, Lakes, Water chemistry, Acidity, Hydrogen ion concentration, *Calcium, Water temperature, *Species diversity, *Tarns.

On the basis of material from over seventy acidic water bodies in three different areas a relationship is revealed between pH and the species diversity of their crustacean faunas. With increasing acidity species diversity decreases. No such relationship is shown between calcium concentration and species diversity. The very low calcium levels of such waters may, however, play a part in the exclusion of certain species. (Deal-EIS)

CADMIUM TOXICITY TO THREE SPECIES OF ESTUARINE INVERTEBRATES,
Environmental Research Lab., Narragansett, RI.
G. G. Pesch, and N. E. Stewart.
Marine Environmental Research, Vol 3, p 145-156, 1980. 3 Fig, 5 Tab, 32 Ref.

Descriptors: *Cadmium, *Toxicity, *Crabs, *Shrimp, Heavy metals, Bioassay, Lethal limit, Mode of action, Mortality, Growth rates, Inhibition, Animal physiology, Invertebrates, Estuarine environment, *Scallop, *Argopecten, *Tissue analysis, *Bioaccumulation.

Three species of estuarine invertebrates, Palaemonetes pugio (grass shrimp), Pagurus longicarpus (hermit crab) and Argopecten irradians (bay scallop), were exposed to Cd in flowing seawater at concentrations of 0.06, 0.12, 0.25, 0.5 and 1.0 mg/litre. Incipient LC50 values of 0.53 and 0.07 mg/litre were estimated for bay scallop and hermit crab, respectively. The toxicity curve for grass shrimp had not stablished, but the incipient LC50 value was estimated to fall within a range of 0.2 to 0.3 mg/litre. Short-term response, as measured by time to 50% mortality at the highest Cd concentration, was 10, 21 and 23 days for the bay scallop, hermit crab and grass shrimp, respectively. Scallop growth was inhibited at all exposure concentrations with a measured 42-day EC50 value of 0.078 mg/litre Cd. Byssal thread detachment precedes death in bay scallops. An EC50 value of 0.54 mg/litre Cd for byssal detachment was measured on day 8 of the bioassay before appreciable mortality. This compared favourably with the incipient LC50 value of 0.53 mg/litre Cd. Cadmium accumulation occurred at all concentrations in bay scallop and grass shrimp. (Deal-EIS)

THE COMBINED EFFECT OF SALINITY, TEMPERATURE AND OIL ON THE GROWTH PATTERN OF EMBRYOS OF THE KILLIFISH, FUNDULUS HETEROCLITUS WALBAUM,
Texas A and M Univ., College Station. Dept. of Biology.
O. Linden, R. Laughlin, Jr., J. R. Sharp, and J. M. Neff.
Marine Environmental Research, Vol 3, p 129-144, 1980. 3 Fig, 4 Tab, 49 Ref.

Descriptors: *Killifishes, *Toxicity, *Oil, Water temperature, Salinity, Inhibition, Growth rates, Embryonic growth stage, Fish physiology, Oil spills, Oil pollution, Fuels, Fish diseases, Animal pathology, Mortality, *Teratology.

Embryos of the estuarine teleost, Fundulus heteroclitus, were exposed during development to different concentrations of the water-soluble fractions (WSF) of a No. 2 fuel oil under various temperature-salinity combinations. Temperatures and salinities were, respectively: 20, 25 or 30 and 10, 20 or 30 o/oo S. The WSF were extracted from No. 2 fuel oil daily and diluted to concentrations of 15, 20 or 25% of the original mixture. Controls were exposed to seawater without WSF at each temperature salinity combination. The length of eleutheroembryos was markedly decreased by exposure to WSF. Temperature exerted an effect on growth at low WSF concentrations (0 and 15% WSF) but not at higher ones. The two highest WSF concentrations had a predominant effect on growth that was not further modified by physical factor influences. Conversely, as the WSF exposure increased, the yolk diameter increased, indicating a decreased utilization of yolk material during development. The mean number of vertebrae in the eleutheroembryos decreased at high WSF concentrations and at high temperatures. Morphological abnormalities consisted predominantly of spinal deformations (scoliosis and lordosis). The data indicate that the survivors of chemical toxicity during embryo development exhibit sublethal responses which would reduce their survival potential in later life. (Deal-EIS)

A MARINE ALGAL BIOASSAY METHOD: RESULTS WITH PESTICIDES AND INDUSTRIAL WASTES,
Environmental Research Labs., Gulf Breeze, FL.
G. E. Walsh, and S. V. Alexander.
Water, Air, and Soil Pollution, Vol 13, p 45-55, 1980. 4 Fig, 5 Tab, 9 Ref.

Descriptors: *Bioassay, *Methodology, *Pesticide toxicity, *Industrial wastes, Toxicity, Marine algae, Diatoms, Growth rates, Inhibition, Pulp wastes, Herbicides, Spectrophotometry, Analytical techniques, *EPN, *Ethoprop, *Carbophenothion, *Methyl parathion, *DEF, *Phorate, *Carbaryl, *Benthiocarb, *Permethrin, *Neburon.

A simple marine algal bioassay method is described for short- and long-term studies on pesticides and industrial wastes. It can be used for rapid screening of a variety of substances with single-species and multiple-species tests and gives relative toxicities of the pollutants tested. Algae are grown in optically matched culture tubes that fit directly into a spectrophotometer, allowing population density to be estimated by absorbance without removal of samples. 96 h EC50 values for some pesticides and the diatom Skeletonema costatum are: EPN, 340 microg/l; carbophenothion, 109 microg/l; DEF, 366 microg/l; ethoprop, 8.4 mg/l; methyl parathion, 5.3 mg/l; and phorate, 1.3 mg/l. Presence of the chelator EDTA in medium had no effect on toxicity of carbaryl to S. costatum, Nitzschia angularum, Chlorococcum sp. and Chlorella sp. Liquid industrial wastes either stimulated growth, inhibited growth, or stimulated growth at low concentrations but inhibited it at higher concentrations. In mixed-species studies with the herbicide neburon, presence of a resistant species protected the sensitive species. Liquid industrial waste from a paper products plant caused changes in relative numbers, as compared to controls, when S. costatum and Porphyridium cruentum were grown together. (Deal-EIS)

CHLOROTIC DEATH OF LEMNA GIBBA BY CADMIUM IN DIFFERENT CONCENTRATIONS OF NUTRITIONAL MINERALS (IN JAPANESE),
Tokyo Univ. of Agriculture and Technology (Japan). Faculty of Agriculture.
M. Seto, Y. Takahashi, T. Ushijima, and T. Tazaki.
The Japanese Journal of Limnology, Vol 40, No 2, p 61-65, 1979. 6 Fig, 2 Tab, 12 Ref. (English Abstract).

Descriptors: *Cadmium, *Trace elements, *Mortality, *Aquatic plants, Plant physiology, Plant pathology, Proteins, Nutrient requirements, Water chemistry, Growth rates, Chemical analysis, *Lemna, *Tissue analysis.

The green frond of Lemna gibba turned into a chlorotic one and always died when cultured in a medium containing cadmium. The ratio of chlorotic fronds to total fronds was greatly affected by the difference in concentration of nutritional minerals even when the concentrations of cadmium in the medium were the same. The cadmium contents of L. gibba were also affected by the difference in concentration of nutritional minerals. The appearance of chlorotic frond was not explicable from the cadmium contents of L. gibba. When cultured in a high concentration of nutritional minerals, the chlorotic frond did not appear in spite of the high content of cadmium in the frond. On the other hand, when cultured in a low concentration of nutritional minerals, the chlorotic frond appeared in spite of the low content of cadmium in the frond. The protein content of L. gibba was changed considerably by the difference in concentration of nutritional minerals. This change in protein content might be related to differences in the

appearance of the chlorotic frond. To study the effect of a pollutant on an organisms, it will be necessary to understand the effect of an environmental condition on an organism as well as the amount of a pollutant accumulated by an organism. (Deal-EIS)

BACTERIA: WHAT ARE THEY,
National Water Well Association, Worthington, OH.
S. Smith.
Water Well Journal, Vol 34, No 2, p 60-61, February, 1980.

Descriptors: *Bacteria, *Disinfection, Autoclaves, Digestion, E-coli, Iron bacteria, Soil bacteria, Sulfur bacteria, Speciation, Adaptation.

Bacteria are the simplest forms of self-sufficient organisms. Their structural simplicity enables them to reproduce quickly and create more resistant strains in response to chemical treatment. Some species form hard or gelatinous shells to withstand boiling water. Anaerobic bacteria can live without oxygen. Autoclaving (pressure cooking) at 121C and 15 psi for twenty minutes is the only sterilization technique that is 100 percent effective in destroying bacteria. But, where situations prohibit autoclaving, other techniques such as chlorination will suffice. Most bacteria are harmless or beneficial. E-coli bacteria helps us digest food. Soil bacteria digest dead plant and animal matter. This process is used in sewage treatment plants to make the effluent fit for further treatment. Harmful bacteria are those which cause discomfort and inconvenience to humans. Iron and sulfate-reducing bacteria are a nuisance but do not present a health hazard. (Purdin-NWWA)

5B. Sources Of Pollution

A NONPOINT SOURCE MODEL FOR LAND AREAS RECEIVING ANIMAL WASTES: III. A CONCEPTUAL MODEL FOR SEDIMENT AND MANURE TRANSPORT,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
R. Khaleel, G. R. Foster, K. R. Reddy, M. R. Overcash, and P. W. Westerman.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 6, p 1353-1361, November-December 1979. 1 Fig, 3 Tab, 46 Ref, 3 Append. EPA R-805011-01-0.

Descriptors: *Water pollution sources, *Sediments, *Farm wastes, *Model studies, Mathematical models, Pollutants, Chemicals, Nitrogen, Phosphorus, Pesticides, Sediment transport, Erosion, Soil erosion, Rill erosion, Agricultural runoff, Agricultural watersheds, Agriculture, Hydrology, Nonpoint water pollution sources.

Some chemical pollutants are adsorbed to soil particles and transported with the sediment load. Sediments contain a mixture of particles of varying sizes and densities that have differing transport characteristics and affinities for chemical pollutants. In addition, manure particles are detached and transported by erosion processes during runoff events. A mathematical model was presented that describes the transport of various sediment particle types during unsteady overland-flow from manured areas. The present version of the model considers transport of four discrete particle fractions--fine primary, coarse primary, soil-aggregate, and manure particles. Sediment originates from two sources--interrill areas and rill areas. Two manure application modes, surface-applied or soil-incorporated, are recognized. The model operates with existing watershed hydrologic models and can be useful in studies of nonpoint source pollution from land areas receiving animal wastes. (Sims-ISWS)

A NONPOINT SOURCE MODEL FOR LAND AREAS RECEIVING ANIMAL WASTES: IV. MODEL INPUTS AND VERIFICATION FOR SEDIMENT AND MANURE TRANSPORT,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
R. Khaleel, G. R. Foster, K. R. Reddy, M. R. Overcash, and P. W. Westerman.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 6, p 1362-1368, November-December 1979. 3 Fig, 8 Tab, 22 Ref. EPA R-805011-01-0.

Descriptors: *Water pollution sources, *Sediments, *Farm wastes, *Model studies, Mathematical models, Watersheds(Basins), On-site data collections, Erosion, Soil erosion, Rill erosion, Sediment transport, Suspended solids, Bed load, Runoff, Storm runoff, Agricultural watersheds, Agricultural runoff, Agriculture, Hydrology, Water pollution, Nonpoint water pollution sources.

A mathematical model describing transport of sediment and manure during unsteady overland flow from land areas receiving animal wastes was presented in a previous paper. Results of a comprehensive literature survey characterizing model inputs due to manure presence were presented in this paper. Inputs were: manure cover on the watershed, manure erodibility factor, and manure particle-size distribution and particle density. Estimated sediment yields were compared with measured data for selected storms on a 1.1-ha pasture watershed near Coshocton, OH. The simulated results agreed reasonably well with these field data. EFFECTS OF SLASH BURIAL ON STREAM WATER QUALITY,
Washington Univ., Seattle. Coll. of Forest Resources.
A. G. Larson, and D. D. Wooldridge.
Journal of Environmental Quality, Vol 9, No 1, p 18-20, January-March 1980. 1 Tab, 14 Ref.

Descriptors: *Forestry, *Water quality, *Waste disposal, *Wood wastes, Forest management, On-site investigations, Sampling, Chemicals, Electrical conductance, Ions, Hydrogen ion concentration, Dissolved oxygen, Streams, Water chemistry, Chemical analysis, Data processing, Forests, Pollutants, Water pollution, Water pollution sources, Logging residue, Slash burial.

A 3-year study investigated impacts of buried logging residue on stream water composition. Burying of logging slash has been proposed as an alternative to burning. Residue was buried in trenches adjacent to two small ephemeral streams; one trench was filled with approximately 180 cu m of logging slash, the other with 94 cu m of mill residue. Streamflow was diverted to flow through the burial pits. Stream water samples collected from above (pretreatment) and below (post-treatment) the burial sites were analyzed for dissolved oxygen, pH, electrical conductance, alkalinity, temperature, K, Na, Ca, Mg, Fe, N03-N, NH4-N, S04-S, P04-P, total N, and total P. Changes in chemical composition occurring between pre- and post-treatment sampling sites were tested for significance using a paired sample t-test. With the exception of dissolved oxygen, surface water degradation resulting from burial was of no practical importance. Many ions decreased in concentration as waters passed through buried residue. Statistical comparisons of pre- and post-treatment water composition indicate significant increases were limited to H; pH decreased from 6.56 to 6.42 as a result of the buried slash. Oxygen depletion may be the most serious burial effect, with mean concentrations in the buried slash stream decreasing from 10 to approximately 8 mg/liter, a drop in oxygen saturation from 93 to 71%. (Sims-ISWS)

TRIFLURALIN MOVEMENT IN RUNOFF FROM A SMALL AGRICULTURAL WATERSHED,
Science and Education Administration, Tifton, GA.
W. A. Rohde, L. E. Asmussen, E. W. Hauser, R. D. Wauchope, and H. D. Allison.
Journal of Environmental Quality, Vol 9, No 1, p 37-42, January-March 1980. 4 Fig, 5 Tab, 16 Ref.

Descriptors: *Herbicides, *Runoff, *Watersheds(Basins), *Georgia, Sampling, Chemical analysis, Pesticides, Agricultural chemicals, Agricultural runoff, Grassed waterways, Agricultural watersheds, Rainfall, Simulated rainfall, Farm management, Agriculture, Water pollution, Path of pollutants, Trifluralin.

Little trifluralin moved in the surface flow from a small agricultural watershed located in the Southeastern Coastal Plain. Movement of trifluralin in 1974 and 1975 in surface water was 0.17 and 0.03%, respectively, of the total amount applied (1.12 kg/ha). Trifluralin movement in the shallow subsurface flow (above the 214 cm depth) was recorded only in 1974 and was negligible. Trifluralin was detectable in the soil from the 1974 application before the 1975 application. Soil concentration of trifluralin in 1974 was 320 ng/g (immediately after application) in the 0- to 10-cm depth and after 114 days the concentration decreased to 73 ng/g. However, no trifluralin was detected in the 30- to 60-cm depth 60 days after application. Simulated surface runoff from subplots on the watershed produced measurable concentrations of trifluralin 38 days after application, but it could not be detected after 71 days. Trifluralin movement was greater in runoff caused by simulated rainfall than that from natural rainfall due to the high application rate of water (19.1 cm/hour) and the lack of a vegetational buffer. Trifluralin loss in the simulated rainfall runoff water from a small plot directed through a 24.4-m waterway was reduced 96% under dry and 86% under wet conditions. Hence, trifluralin movement can be significantly reduced and possibly managed by buffer strips or vegetated waterways adjoining cropped areas. Appropriate use of these buffer areas should reduce to acceptable levels the chemical concentration in the runoff before the runoff reaches the surrounding streams. (Sims-ISWS)

FERTILIZER NUTRIENT LOSSES FROM RANGELAND WATERSHEDS IN CENTRAL OKLAHOMA,
Science and Education Administration, Durant, OK.
A. Olness, E. D. Rhoades, S. J. Smith, and R. G. Menzel.
Journal of Environmental Quality, Vol 9, No 1, p 81-86, January-March 1980. 3 Fig, 5 Tab, 14 Ref.

Descriptors: *Range management, *Fertilizers, *Grazing, *Nutrient removal, *Oklahoma, Ranges, Watersheds(Basins), Rainfall, Runoff, Nutrients, Nitrogen, Phosphorus, Water quality, Erosion, Vegetation effects, Grasslands, Grasses, Range grasses.

Four native grassland watersheds were monitored for nitrogen and phosphorus nutrient losses in surface runoff. The watersheds, paired in surface hydrology and grazing management, were 8 to 11 ha in area with 3% slopes. One watershed of each pair was fertilized with 85 kg N/ha (as NH4(+)-N) and 75 kg P/ha surface broadcast. Ten 3.66 by 5.49 m (20 sq m) areas within each watershed were covered with plastic sheets during fertilization to provide unfertilized check plots. Fertilizer losses in surface runoff over the first year were 5% or less of the amounts applied. Soluble NH4(+)-N concentrations in surface runoff increased significantly only during the first month after fertilizer application. Soluble P concentrations incrased sharply after fertilization and remained relatively high even after 12 mo. Forage yields were increased 50

to 100% on fertilized areas. Increases in nutrient uptake of fertilized vegetation the first year equaled 17 to 25.5 kg/ha and 7.5 to 11 kg/ha of the added N and P, respectively. (Sims-ISWS)

PHOSPHORUS VARIATIONS IN SURFACE RUNOFF FROM AGRICULTURAL LANDS AS A FUNCTION OF LAND USE,
Wisconsin Univ.-Madison. Dept. of Soil Science.
R. C. Wendt, and R. B. Corey.
Journal of Environmental Quality, Vol 9, No 1, p 130-136, January-March 1980. 8 Tab, 29 Ref.

Descriptors: *Phosphorus, *Agricultural runoff, *Nutrient removal, *Land use, Algae, Nutrients, Runoff, Water pollution, Water pollution sources, Eutrophication, Fertilizers, Farm wastes, Sediments, Infiltration, Crops, Forests, Agriculture, Nonpoint water pollution sources.

Phosphorus (P) carried in surface runoff from agricultural lands can be a major source of algal-available P in surface waters. The available P may include both dissolved and some fraction of the sediment-bound forms. In this study the effects of land use, time of year, and application of animal manure on several forms of P in runoff from farmed and forested lands were investigated. Simulated rain was used to generate runoff. Losses of dissolved molybdate-reactive P (DMRP), the majority of which is dissolved orthophosphate, were greatest from established or newly seeded alfalfa fields (Medicago sativa L.) in the fall after the foliage had been killed by frost. The fraction of total P lost as DMRP was greater for alfalfa than for corn (Zea mays L.) or a conventionally prepared seedbed. Greatest total P losses were from corn and seedbed areas due to greater sediment losses. Phosphorus potentially available to algae was estimated by extraction with hydroxy-aluminum resin. Amounts extracted were equal to DMRP plus an average of 17 and 34% of the remaining total P for samples with and without apparent sediment, respectively. Greatest losses were associated with highest sediment loads. Surface-applied manure on corn and alfalfa increased P concentrations in runoff but, due to increased infiltration, did not significantly increase P losses. Loss of P from forest land was less than from crop land. (Sims-ISWS)

PERSISTENCE OF FLURIDONE IN SMALL PONDS,
Fisheries and Marine Service, Winnipeg (Manitoba). Dept. of Fisheries and Ocean.
D. C. G. Muir, N. P. Grift, A. P. Blouw, and W. L. Lockhart.
Journal of Environmental Quality, Vol 9, No 1, p 151-156, January-March 1980. 4 Fig, 5 Tab, 15 Ref.

Descriptors: *Herbicides, *Ponds, *Persistence, Aquatic weeds, Aquatic weed control, Water pollution, Pollutants, On-site investigations, Sampling, Sediments, Adsorption, Fish, Bioassay, Chemical degradation, Fluridone.

Fluridone was applied to three small ponds (5 by 3.5 sq m) to give water concentrations of 5,000, 700, and 70 micrograms/liter, respectively. Water, hydrosoil (0 to 3 and 3 to 6 cm depth), duckweed (Lemna minor), and minnows (Pimephales promelas) were collected for residue analysis over a 70-week period following herbicide application. The half-life of fluridone in the water column (0.5 m depth) ranged from 4 (at 700 micrograms/liter) to 7 days (70 micrograms/liter). Upon retreatment of one of the ponds the following year at 100 micrograms/liter, a half-life of 4 days was observed. Fluridone persisted in hydrosoils with an apparent half-life of 1 year or more at all treatment levels. Retreatment of one of the ponds resulted in a buildup of herbicide residue which dissipated more rapidly (half-life of 20 weeks) than after the first treatment. Bioassays indicated that fluridone residues in hydrosoil from the ponds treated at 700 and 5,000 micrograms/liter, taken 42 to 70 weeks after treatment, were phytotoxic to duckweed. Fluridone levels in minnows were very low (less than 0.02 to 0.14 microgram/g) throughout the sampling period with bioconcentration factors ranging from 0 to 64. Fluridone levels in duckweed were proportional to the herbicide concentrations in the pond water with bioconcentration factors ranging from 19 to 85. (Sims-ISWS)

A COMPARISON OF COMPOSITE SAMPLING TECHNIQUES FOR MONITORING RUNOFF,
Wisconsin Univ.-Madison. Dept. of Soil Science.
T. C. Daniel, R. C. Wendt, P. E. McGuire, and D. Stoffel.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 6, p 1310-1312, November-December 1979. 2 Fig, 1 Tab, 6 Ref. EPA G005139-01.

Descriptors: *Runoff, *Pollutants, *Sampling, *Monitoring, Data processing, Analytical techniques, Pollutant identification, Suspended solids, Nitrogen, Phosphorus, Nutrients, Water pollution sources, Agricultural runoff, Agriculture.

The technical feasibility of using a flow proportional composite sample for determining event loads was evaluated using runoff data from an ongoing watershed investigation. For the same event, loads were calculated and compared using the following methods: (1) discrete event load (DEL), (2) composite event load (CEL), and (3) three sample mean event load (SMEL). The DEL method is based on standard integration techniques using the concentration of individual discrete samples taken at preselected runoff intervals (proportional to flow). The CEL procedure utilizes the concentration of a flow proportional composite sample in combination with total volume of runoff, whereas the SMEL method uses the mean concentration of three selected samples taken on the basis of time into the event. DEL data were assumed to be true value and serve as a basis of comparison for the CEL and SMEL procedures. A highly significant correlation was shown to exist between the DEL and the CEL and SMEL methods for all parameters analyzed, i.e., suspended solids (SS) and nitrogen and phosphorus components. Slopes and intercepts of each method for all parameters approached one and zero, respectively. No significant difference between the CEL and SMEL methods was detected, although there appeared to be a tendency for the SMEL method to overestimate the loads of SS and associated parameters for large events. Both the CEL and SMEL methods are technically sound and result in considerable savings in analysis cost. The advantages of the CEL over the SMEL method, especially for new monitoring programs, are that additional savings in analysis cost can be realized along with the elimination of considerable amounts of hand labor. IMPACT OF UNCONFINED LIVESTOCK ACTIVITIES ON WATER QUALITY,
Louisiana Tech Univ., Ruston. Dept. of Agricultural Engineering.
J. W. D. Robbins.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 6, p 1317-1323, November-December 1979. 8 Tab, 32 Ref. EPA R804497.

Descriptors: *Water quality, *Pastures, *Livestock, *Agricultural runoff, Effects, Water pollution sources, Erosion, Sedimentation, Farm management, Land use, Pollutants, Path of pollutants, Coliforms, Biochemical oxygen demand, Nitrogen, Phosphorus, Agriculture, Reviews, Unconfined livestock impact.

Current knowledge related to environmental effects of grazing animals was presented. All available data indicate that pollutant yields from pasture and rangeland operations are not directly related to the number of animals or amount of wastes involved. Rather, they are intimately related to hydrogeological and management factors and are best described as the results of the erosion/sediment phenomenon. (Sims-ISWS)

MIXING PROCESSES ON THE ATLANTIC CONTINENTAL SHELF, CAPE COD TO CAPE HATTERAS,
California Univ., Berkeley. Dept. of Civil Engineering.
H. B. Fischer.
Limnology and Oceanography, Vol 25, No 1, p 114-125, January 1980. 6 Fig, 1 Tab, 22 Ref.

Descriptors: *Mixing, *Circulation, *Continental shelf, *Atlantic Ocean, Water circulation, Ocean circulation, Dispersion, Water pollution, Currents(Water), Ocean currents, Water temperature, Sewage, Coliforms, Bacteria, Path of pollutants, Current meters, Aerial photography, Oceanography, *Middle Atlantic Bight.

Data from moored current meters and airborne and satellite observations were used in conjunction with analyses of shear flow dispersion to estimate the dispersion of dissolved substances in the Middle Atlantic Bight during unstratified periods. The long-shelf dispersion coefficient was estimated to be of the order of 10,000-100,000 sq cm/s, and the cross-shelf dispersion coefficient of the order of 300,000 sq cm/s at midshelf. The cross-shelf estimate was a factor of 10 less than previous ones, which were based on the assumption that the cross-shelf flux of freshwater is equal to the inflow from tributary rivers within the bight itself. WATER-QUALITY CHARACTERISTICS OF STREAMS IN FORESTED AND RURAL AREAS OF NORTH CAROLINA,
Geological Survey, Raleigh, NC. Water Resources Div.
C. E. Simmons, and R. C. Heath.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-149834, Price code: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-108, 1979. 49 p, 15 Fig, 6 Tab, 15 Ref.

Descriptors: *Water quality, *Streams, *Forests, *Rural areas, *North Carolina, Water pollution sources, Natural streams, High flow, Low flow, Environmental effects, Geochemistry, Baseline studies, Storm runoff, Chemical analysis, Evaluation.

Data collected in North Carolina during 1973-78 from a statewide network of 39 rural sampling sites were used to define unpolluted or baseline stream quality. The basins were 90 to 100 percent forested and, except for the unknown effects of air pollution, were relatively unaffected by man's activities. Five distinct geochemical zones were delineated across the State. The chemical characteristics of surface waters in each zone are similar. Mean and other statistical values for major dissolved constituents, nutrients, and minor elements in base runoff and storm runoff were determined. Twenty additional rural sites were located in basins where farming activities ranged from 15 to 55 percent of basins' land area. Data from these 20 sites were used for comparison with data from the 39 unpolluted sites to determine the increase in constituent levels caused by man. For basins where farming activities accounted for 20 or more percent of total land use, phosphorus levels were 2 to 13 times greater than those from the forested basins and several major constituents were 2 to 3 times greater. Concentrations of minor elements were essentially the same in both developed and undeveloped basins. (Kosco-USGS)

SOLUBILITY OF SELECTED MAJOR AND MINOR ELEMENTS FROM COAL, GOB AND FLY ASH ACCUMULATIONS,
Kansas Water Resources Research Inst., Manhattan.
D. A. Kopsick, and E. E. Angino.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-175334, Price codes: A03 in paper copy, A01 in microfiche. Project Completion Report, March 1980. p 26, 10 Fig, 2 Tab. OWRT-A-087-KAN(1).

Descriptors: *Coals, *Water pollution, *Leachates, *Groundwater, *Fly ash, Leaching, Ion transport, Calcium, Magnesium, Sodium, Potassium, Iron, Manganese, Zinc, Copper, Lead, Cadmium.

Nine different fly and bottom ashes, representing four coal producing areas of the United States were used in leaching experiments for Ca, Mg, Na, K, Fe, Mn, Zn, Cu, Pb, and Cd and the potential for contamination of ground and surface water supplied by these elements. Both fly ash and bottom ash are formed by the thermal decomposition or dehydration of inorganic impurities in coal and vary with the type of coal used. Many factors affect leachate characteristics such as coal preparation methods, method and efficiency of combustion, method of disposal, particle morphology, and others. Glass columns 2 ft in length, 2 in in diameter, and packed with 18 in of sample were used to study the leachates. Distilled, deionized water was used as the leaching solution. Three leaching patterns were observed: (1) a hyperbolic curve with a large initial flush of elements followed by leveling off, (2) a constant release especially for calcium, and (3) a delay in time before maximum release concentration. Missouri coal leachate was rich in Pb, Zn, Cu, Fe, Mn, and Cd. This richness combined with a pH of 3.0 gives the Missouri coal the greatest potential for groundwater contamination. Low trace metal concentrations were observed for Wyoming fly and bottom ashes, but they were high in K, Na, Ca, and Mg. Kentucky and Illionis coals gave intermediate results. (Seigler-IPA)

PUBLIC HEALTH ASPECTS OF LAND DISPOSAL OF SUGAR REFINING WASTES BY SPRAY IRRIGATION,
North Dakota State Univ., Fargo. Dept. of Bacteriology.
B. R. Funke.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-175359, Price codes: A02 in paper copy, A01 in microfiche. North Dakota Water Resources Research Institute, North Dakota State University Research Project Technical Completion Report, October 1979. p 9. OWRT A-057-NDAK(1).

Descriptors: *Salmonella, *Sprinkler irrigation, *Sugar beets, *Public health, Coliforms, Waste water disposal, Soil microbiology, Irrigation practices, Irrigation water, Water resue, Irrigated land, Alfalfa, Agriculture, Bacteria.

The potential of a public health hazard caused by the spray irrigation disposal of sugar beet processing wastes contaminated with Salmonella bacteria was investigated at the Hillsboro, North Dakota plant of the American Crystal Sugar Company. Incoming sugar beets are washed, sliced, and processed for sugar extraction. At times all water used is not recycled and lime-mud waters are pumped into an irrigation lagoon and disposed of by spray irrigation. Most-probable-number methods using selective and differential media were used to enumerate the bacteria from various locations in the processing sequence and in the disposal lagoons used. Fecal coliforms were also enumerated by standard methods. Results show that the processing water of the plant often had large populations of both Salmonella and fecal coliform bacteria. Salmonella were found in the irrigation lagoon at some times during the year but not during the warmer months when spraying was done. No Salmonella were found in the soil sprayed with the lagoon water. The source of Salmonella at the plant was found to be the tare soil on the incoming beets. The soil was also the source of the fecal coliforms. However, neither fecal coliforms or Salmonella were found in beet field soils and farmers denied using animal wastes as fertilizer in the fields. The study does not indicate any public health problems as a result of spray irrigation disposal of the sugar beet processing wastes. (Seigler-IPA)

CHEMICAL TRACERS FOR PARTICLE TRANSPORT IN THE CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, MD. Chesapeake Bay Inst.
A. Eaton, V. Grant, and M. G. Gross.
Estuarine and Coastal Marine Science, Vol 10, No 1, p 75-83, January 1980. 4 Fig, 2 Tab, 31 Ref. DOE EY76-S02-3292.

Descriptors: *Suspended solids, *Turbidity, *Sediment transport, *Tracers, *Chesapeake Bay, Trace elements, Pollutants, Nutrients, Metals, Iron, Titanium, Zinc, Sampling, Chemical analysis, Rivers, Water pollution, Water pollution sources, Estuaries, *Susquehanna River(MD).

Particulate material from the Susquehanna River is enriched in Fe (5-7%), allowing it to be distinguished from other sources of particles in surface waters of the Chesapeake Bay. Although the turbidity maximum removes most of the river-borne detritus, chemical composition of suspended particle matter (SPM) indicates that Susquehanna River materials dominate the inorganic suspended matter in surface waters of the Bay at least 20-40 km further. Fe concentrations, Fe/Ti, and Fe/Zn ratios in surface water SPM still farther down the Bay indicate that those particles are a mixture of river derived and biological material and that shore erosion is not normally a source of surface water suspended sediments as far as the mouth of the Potomac. Seasonal variations of elemental ratios such as Fe/Zn can also be used to demonstrate scavenging of soluble trace elements by particles during summer conditions. (Sims-ISWS)

CHLOROPHYLL TURNOVER IN SKELETONEMA COSTATUM, A MARINE PLANKTON DIATOM,
Brookhaven National Lab., Uptown, NY. Dept. of Energy and Environment.
D. M. Riper, T. G. Owens, and P. G. Falkowski.
Plant Physiology, Vol 64, No 1, p 49-54, July 1979. 7 Fig, 1 Tab, 17 Ref. EY-76-C-02-0016.

Descriptors: *Skeletonema costatum, *Chlorophyll, *Marine plants, *Tracking techniques, Diatoms, Chlorophyll-a, Chlorophyllide-c, Plankton, Tracers, Radioisotopes, Cytological studies, Aminolevulinic acids(ALA), Dye dispersion, Radioactivity techniques, Photosynthesis.

Radioactively-labeled Aminolevulinic acids (ALA) were incorporated into the chlorophylls of Skeletonema costatum, a marine plankton diatom. It was noted that normal cells of S. costatum took up significant extracellular ALA, even though they were originally thought to be impermeable to primary amino acids. Up to 2% of the total ALA uptake was incorporated into chlorophyll-a and chlorophyllide-c. Radioactive ALA was not directly incorporated into carotenoid or xantophyll pigments. The addition of 0.5 micro mole ALA to the culture media did not alter the rates of cell division of chlorophyll-a and chlorophyllide-c accumulation from those of untreated cells. Pigment specific activity of chlorophyllide-c was greater than that of chlorophyll-a. The incorporation of radioactive ALA into chlorophyll-a and chlorophyllide-c pools in stationary cultures of S. costatum was rapid and reached equilibrium after 10 hours. Cells which have been exposed to radioactive ALA for 48 hours and had attained a density of one million cells/ml were resuspended in fresh media at a density of 300,000 cells/ml. Complete dilution of the labeled pigment pools was not observed. The initial rapid loss of label was followed by a period of little or no loss and a specific activity of the pool of about 30% of the maximum attained before the resuspension. Beyond 15 hours the pigment pools showed a trend of increased labeling. The dilution of chlorophyll-a and chlorophyllide-c pools labeled with ALA hydrogen and carbon isotopes indicated that C14 incorporation began 20 hours after the resuspension, and was accompanied by slight increase in H3 labeling. COMPARATIVE CARBOHYDRATE STORAGE AND UTILIZATION PATTERNS IN THE SUBMERSED MACROPHYTES, MYRIOPHYLLUM SPICATUM AND VALLISNERIA AMERICANA,
Wisconsin Univ.-Madison. Dept. of Botany.
J. E. Titus, and M. S. Adams.
The American Midland Naturalist, Vol 102, No 2, p 263-272, October 1979. 3 Fig, 1 Tab, 35 Ref. NSF DEB-19-777; AG 40-193-69.

Descriptors: *Carbohydrates, *Nutrient requirements, *Myriophyllum spicatum, *Vallisneria americana, *Plant growth regulators, Lake Wingra(WI), Submerged plants, Aquatic weed control, Nuisance algae, Biomass, Seasonal, Rooted aquatic plants, Metabolism, Productivity, Macrophytes, Growth rates.

The hypothesis that ample storage of total nonstructural carbohydrates (TNC) by Vallisneria americana could support a growth flush to compensate for its short growing season was tested by the analysis and comparison of plant tissues of Myriophyllum spicatum and Vallisneria americana. Myriophyllum and Vallisneria plants were collected at four stations on Lake Wingra, Madison, Wisconsin. Sampling was conducted during annual cycles in 1974 and 1975. The sampling methods were designed in such a manner that it was possible to quantify shoot/root ratios. Both species exhibited marked seasonal patterns in percentages of TNC in above and below-sediment plant parts. Mean TNC values in M. spicatum ranged from 1.6-19.0% for roots and 2.0-20.0% for shoots. The low values were associated with the spring growth flush. V. americana tissues ranged from 4.0-28.0% TNC during the growing season, while winter bud TNC values were 45%. However, since the winter

biomass was quantitatively low, the total winter reserves of V. americana community were inadequate to permit compensation for a late start in spring. Thus, the proposed hypothesis that ample storage of TNC by V. americana could support a growth flush to compensate for its short growing season was rejected. (Harris-Wisconsin)

PREVENT GROUND WATER CONTAMINATION BEFORE IT'S TOO LATE,
Camp, Dresser and McKee, Boston, MA.

Water and Wastes Engineering, Vol. 17, No. 2, p 30-33, 63, February, 1980. 2 Fig, 2 Tab.

Descriptors: *Groundwater, *Water pollution control, *Organic wastes, *Public health, *Water pollution sources, *Water pollution treatment, Carcinogens, Toxicity, Septic tanks, Landfills, Leachate, Leakage, Sewerage, Storage tanks, Waste disposal, Waste storage, Accidents, Aeration, Carbon filters, Resins, Adsorption, Oxidation, Biodegradation, Costs.

The use of ground water for both water supply and waste disposal often results in contamination from toxic compounds. Little attenuation of these organic contaminants occurs in aquifers. The effects of toxic chemicals on human health are debatable but safe levels must be established. A preliminary list of 13 carcinogens published by the EPA shows cancer risk increases with increasing contaminant levels. Also shown are the maximum noncarcinogenic levels for various lengths of exposure. Over the past 12 to 15 months more than 25 Massachusetts municipal water supplies and numerous private wells have been contaminated by organics. Contaminant sources included: septic systems, landfill leachate, sewer system leaks, storage tank leaks, industrial waste lagoons, accidental spills, and illegal disposals. Aquifer decontamination requires a considerable amount of time and expense. Methods for removal of organics include aeration, carbon adsorption, synthetic resin adsorption, oxidation, and biodegration. A combination of processes is the most effective approach. The cost of this treatment will greatly exceed the cost of surface water treatment. Future organic contamination should be prevented by establishing aquifer protection zones, managing septic systems, repairing sewer system leaks, controlling major chemical discharges, and regulating the construction and testing of storage tanks. (Purdin-NWWA)

AN ENVIRONMENTAL STUDY OF THE ORIGIN, DISTRIBUTION, AND BIOACCUMULATION OF SELENIUM IN KENTUCKY AND BARKLEY LAKES,
Kentucky Water Resources Research Inst., Lexington.
B. E. McClellan, and K. J. Frazer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-176118, Price codes: A03 in paper copy, A01 in microfiche. Research Report No 122, 1980. 44 p, 11 Fig, 5 Tab, 6 Ref. OWRT A-075-KY(1), 14-34-0001-8019, 14-34-0001-9019.

Descriptors: *Trace elements, Deposition(Sediments), Water quality, Chemical analysis, *Lakes, *Streams, *Sediments, *Fish, Kentucky, Tennessee, Atomic absorption spectrometry, Bioaccumulation.

Samples of water, bottom sediment, and fish were analyzed for toxic metal ion content. The samples were collected from several selected sites along Kentucky and Barkley Lakes as well as the Cumberland River and several sub-impoundments along these aquatic systems. Emphasis was placed on selenium, although several other metal ions were determined. The results showed that there are no serious pollution problems with As, Cd, Cr, Cu, Hg, Pb, Se, Sr, Zn, or Zr at any of the sites examined. Actually, none of the trace metals examined even come close to the EPA limits on fish, with the exception of lead in the White Crappie and mercury in the Bass. There appears to be no serious problem with lead in White Crappie as only two fish out of a total of nineteen were above the limit of 2 PPM. The same holds for mercury in the bass as only three fish out of thirty-four were above the 0.5 PPM level. Water and sediment analyses for the above mentioned metal ions fell well within expected 'normal' limits for unpolluted fresh water systems. No point sources could be identified for any of the metal ions. This is in contrast with results obtained on the lower Tennessee River by Hancock, et al, in which a large chemical complex was found to contribute significant quantities of trace metals. No significant seasonal variation of trace element content was observed in any of the sample types. Since the selenium content of all samples was so low, no laboratory bioaccumulation data were obtained. No general correlation between fish length and trace element content could be established.

Hydrobiological Journal, Vol 14, No 6, p 73-77, 1978. 1 Fig, 1 Tab, 14 Ref.

Descriptors: *Lead, *Adsorption, *Aquatic plants, Absorption, Heavy metals, Lead radioisotopes, Physicochemical properties, Water chemistry, Hydrogen ion concentration, Plant physiology, Plant pathology, Mode of action, Membrane processes, *Bioaccumulation, *Tissue analysis.

The uptake of 210Pb by aquatic plants take place mainly by adsorption on the cell walls. The accumulation rate of 210Pb is determined by its physicochemical state in the water, pH and communicative properties of cell walls. It also depends on Ca concentration in the water, the strength of its adsorption on cell walls, and the amount of stable lead in the plants and bottom sediments. In investigating the toxic effect of lead on Nitellopsis obtusa it was found that lead in a concentration of 0.5 mg/liter causes a lowering of protoplasm movement rate and partial destruction of cells and rhizoids. At concentration of 20.7 mg/liter, all cells and rhizoids die. (Deal-EIS)

STUDIES ON THE BINDING OF HEAVY METALS TO ALGAL POLYSACCHARIDES FROM PHILIPPINE SEAWEEDS. I. CARRAGEENAN AND THE BINDING OF LEAD AND CADMIUM,
Philippines Univ., Diliman, Quezon City. Marine Sciences Center.
R. L. Veroy, N. Montano, L. B. de Guzman, E. C. Laserna, and G. J. B. Cajipe.
Botanica Marina, Vol 23, p 59-62, 1980. 1 Fig, 3 Tab, 15 Ref.

Descriptors: *Heavy metals, *Absorption, *Marine algae, Effects, Cadmium, Lead, Path of pollutants, Chemical analysis, Spectrophotometry, Metabolism, Biochemistry, Sulfates, *Seaweeds, *Carrageenan.

The metal-binding properties of the sulfated polysaccharides k- and l-carrageenan from Eucheuma striatum and Eucheuma spinosum are investigated by dialysing solutions of carrageenan against solutions of lead and cadmium salts. Alternatively, solutions of these metal cations are eluted through a column of the coarsely ground alga. The amounts of lead and cadmium bound by the polysaccharide are determined by atomic absorption spectrophotometry. Carrageenan is found to effectively bind both heavy metals, exhibiting a greater, though not significantly pronounced, affinity for lead. Metal binding capacity is correlated with the degree of sulfation of the carrageenan molecule. (Deal-EIS)

THE EFFECTS OF MERCURY EXPOSURE ON INTRACELLULAR DISTRIBUTION OF MERCURY, COPPER AND ZINC IN SKELETONEMA COSTATUM (GREV.) CLEVE,
British Columbia Univ., Vancouver. Dept. of Oceanography.
L. Cloutier-Mantha, and D. A. Brown.
Botanica Marina, Vol 23, p 53-58, 1980. 2 Fig, 2 Tab, 34 Ref.

Descriptors: *Mercury, *Copper, *Zinc, *Diatoms, Bioassay, Absorption, Metabolism, Path of pollutants, Heavy metals, Growth rates, Inhibition, Toxicity, Mode of action, Biochemistry, Mode of action, *Skeletonema.

The effects of exposure to low concentrations of HgC12 on the intracellular levels of Cu, Zn and Hg in S. costatum grown in artificial seawater were determined. An attempt was made to determine whether mercury-induced synthesis of metallothionein-like substance could be responsible for sequestering heavy metals in a diatom. Short-term exposure to 1.84 nM HgC12 resulted in a reduced growth rate and cell density, possibly due to the toxic effects of Hg which mainly accumulated in the high molecular weight pool. Pre-exposure to 1.84 nM HgC12 prior to exposure at 5.53 nM HgC12 resulted in a lower accumulation of Hg in the high m.w. pool. Exposure to 0.37 nM HgC12 was sufficient to alter the levels and distribution of intracellular Cu and Zn. Upon Hg exposure, Zn levels decreased in high and low m.w. fractions but gradually increased in the medium m.w. pool. Copper slightly increased in the high m.w. pool but remained constant in the medium and low m.w. pools in relation to total intracellular levels. The increase of Zn in the medium m.w. pool, in Hg-exposed cultures, the low levels of Cu and Zn in the medium m.w. fractions, and the absence of aromatic amino acids, suggest that metallothionein may play a role in storage or detoxification of heavy metals in S. costatum. High levels of Cu and Zn in the low m.w. pool may indicate that a substance of lower m.w. than usually reported for metallothionein-like substance also may play a role in the storage and detoxification of heavy metals in S. costatum. THE EFFECTS OF HARDNESS, ALKALINITY AND PH OF TEST WATER ON THE TOXICITY OF COPPER TO RAINBOW TROUT (SALMO GAIRDNERI),
Alberta Univ., Edmonton. Dept. of Zoology.
T. G. Miller, and W. C. Mackay.
Water Research, Vol 14, p 129-133, 1980. 2 Fig, 2 Tab, 34 Ref.

Descriptors: *Toxicity, *Copper, *Water chemistry, Rainbow trout, Hardness(Water), Alkalinity,

Hydrogen ion concentration, Lethal limit, Mortality, Chemical reactions, Chemical analysis, Mathematical models, Statistical analysis.

Rainbow trout were used to determine the effects of water alkalinity and hardness on the incipient lethal concentration (ILC) of copper. At low water hardness (12 ppm) the ILC of copper was not affected by a five-fold change in medium alkalinity (10-50 ppm); however in hardwater (98 ppm) the same change in alkalinity caused the ILC to increase by 1.8 times. The ILC for copper increased as hardness increased regardless of alkalinity. At pHs of less than 5.4 the toxicity of various combinations of copper and hydrogen ion were antagonistic but at pH 5.4 there appeared to be some synergism between pH and Cu toxicity. (Deal-EIS)

EFFECTS ON RAINBOW TROUT (SALMO GAIRDNERI) OF A CHRONIC EXPOSURE TO WATERBORNE SELENIUM,
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Lab.
P. V. Hodson, D. J. Spry, and B. R. Blunt.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 37, p 233-240, 1980. 1 Fig, 5 Tab, 28 Ref.

Descriptors: *Toxicity, *Rainbow trout, *Metals, Lethal limit, Embryonic growth stage, Mortality, Mode of action, Fish eggs, Fish physiology, Monitoring, *Selenium, *Tissue analysis, *Bioaccumulation, *Blood chemistry.

The 96-h and 9-d LC50s of selenium for rainbow trout averaged 8.1 and 6.5 mg/l, respectively. A sublethal exposure of rainbow trout from the newly fertilized egg stage until 44 wk posthatch to 4.4-53 microg/l of waterborne selenium resulted in a variety of subtle responses. Significantly increased mortality of eyed eggs was observed at selenium concentrations greater than or equal to 28 microg/l and decreased red blood cell volumes and cellular blood iron at concentrations greater than or equal to 53 and 16 micro/l, respectively. Although the highest eyed egg mortality at 47 microg/l selenium was double that of control, total mortality was only 6.5%. Similarly, the blood parameters decreased from control levels by a maximum of 30% and the fish appeared to be compensating for these changes by increased erythropoiesis. Overall, the fish responded to selenium exposure at concentrations between 100 and 250 times the normal background concentrations in surface waters but the level of response was low. Analyses of tissue selenium at 44 wk posthatch indicated that residues clearly reflected exposure, that liver, digestive tract, and kidney accumulated the highest residues, that selenium tissue concentrations may be regulated, and that specific tissues provide a better basis for monitoring selenium exposure than whole body analyses. RESPIRATORY PROPERTIES OF ERYTHROCRUORIN (EXTRACELLULAR HEMOGLOBIN) IN THE BLOOD OF THE ANNELID ARENICOLA MARINA WITH SPECIAL REFERENCE TO THE INFLUENCES OF SALINITY AND TEMPERATURE,
Aarhus Univ. (Denmark). Dept. of Zoophysiology.
K. K. Rasmussen, and R. E. Weber.
Ophelia, Vol 18, No 2, p 151-170, 1979. 10 Fig, 1 Tab, 37 Ref.

Descriptors: *Annelids, *Respiration, *Salinity, *Water temperature, Animal physiology, Animal metabolism, Salt tolerance, Hydrogen ion concentration, Water chemistry, Oxygen, Carbon dioxide, *Acclimation, *Blood chemistry, *Hemoglobin, *Erythrocruorin.

Acclimation of Arenicola marina to high salinity increases the 02 affinity of the erythrocruorin in the blood compared to that in low-salinity acclimated animals. At pH 7.4 and 20C, the 02 tensions required for half-saturation (P50) are 2.1 and 3.3 mm Hg at water salinities of 32.3 and 10.2 o/oo, respectively. Acclimation salinity, however, does not appear to exert a consistent influence on the Bohr effect or the buffer capacity of the blood, although the buffer reserve is higher in low-than in high-salinity acclimated animals. The influence of temperature on the 02 affinity of the blood is small and appears to be independent of salinity. Acclimating batches of Arenicola to 6 and 18C, however, produced no evidence for thermo-acclimatory changes in blood 02 affinity. Curiously a specific effect of C02 (i.e. one which is not related to concomitant pH change) increases 02 affinity of the erythrocruorm rather than decreasing it as in vertebrate hemoglobin. The data are discussed as regards their possible adaptive significance to the worms in burrowing and intertidal habitats. (Deal-EIS)

SOME EFFECTS OF SALINITY AND TEMPERATURE ON THE OSMOTIC AND IONIC REGULATION OF PRAUNUS FLEXUOSUS (CRUSTACEA, MYSIDACEA) FROM ISEFJORD,
Stirling Univ. (Scotland). Dept. of Biology.
D. S. McLusky.
Ophelia, Vol 18, No 2, p 191-203, 1979. 3 Fig, 5 Tab, 30 Ref.

Descriptors: *Salinity, *Water temperature, *Toxicity, *Osmosis, Crustaceans, Membrane processes, Salt tolerance, Mortality, Sodium, Potassium, Calcium, Magnesium, Chlorides, Animal physiology, *Osmoregulation, *Acclimation, *Blood chemistry.

The salinity tolerance, osmotic regulation and ionic regulation of the mysid crustacean, Praunus flexuosus, collected at the Isefjord, Denmark, has been investigated over a range of salinities, and at temperatures from 5 to 20C for both winter and summer animals. Survival at low salinities was enhanced when the animals were kept at low temperatures, and this enhancement was especially pronounced in animals collected in winter. A clear pattern of hyper/hypo-osmotic regulation was found, but no effect of season or temperature on the osmotic concentration was observed. The blood concentration of Isefjord animals was significantly lower at any given salinity than that of previously studied animals from Loch Etive, Scotland. This reduction is considered to be due to long-term acclimation, and the findings are compared with other crustacea where studies have been made on distinct populations. The blood concentrations of sodium, potassium, calcium, magnesium and chloride were determined at three salinities, and found when totalled to account for the osmotic concentrations. (Deal-EIS)

OSMOTIC RESPONSES OF EGGS AND LARVAE OF THE PACIFIC HERRING TO SALINITY AND CADMIUM,
Fisheries and Marine Service, Nanaimo (British Columbia). Pacific Biological Station.
D. F. Alderdice, T. R. Rao, and H. Rosenthal.
Helgolander wissenschaftliche Meeresuntersuchungen, Vol 32, p 508-538, 1979. 10 Fig, 11 Tab, 33 Ref.

Descriptors: *Cadmium, *Salinity, *Toxicity, *Herrings, Larval growth stage, Membrane processes, Osmosis, Fish eggs, Fish physiology, Mode of action, Heavy metals, Salt tolerance, Water chemistry, Pacific herring, *Osmoregulation.

Pacific herring (Clupea pallasi) eggs fertilized in 20 o/oo S and incubated in 5, 20 or 35 o/oo S at 5C, some being cross-transferred between 5 and 35 o/oo S, 61.8 hr after fertilization, showed variable yolk and perivitelline fluid (PVF) osmolalities until beginning of epiboly. Coincident with blastopore closure and for a period of ca. 150 hr thereafter (period of stability), both yolk and PVF osmoconcentrations were relatively constant. Thereafter osmolalities rose slowly to asymptotic levels prior to hatching. An hypothesis is presented whereby minimum osmotic work is defined on the basis of isosmotic relations existing between yolk, perivitelline fluid, and incubation medium. This leads to the description of a range of salinities defined in terms of osmoregulatory scope. The presence of a salinity-temperature interaction and its influence on the association between osmoregulatory scope and production of viable larvae is suggested as a mechanism underlying and providing the recognized plasticity of Pacific herring egg development. In a companion study involving cadmium as a contaminant, eggs incubated at 20 o/oo S were exposed to 0, 1 or 10 ppm Cd in 5, 20 or 35 o/oo S for 48-hr periods at six stages of development between fertilization and hatching. Cd exposure resulted in a reduction in osmolality of perivitelline fluid. Reduction was greater in higher Cd concentrations and in eggs transferred to higher salinities. (Deal-EIS)

LIVER CADMIUM UPTAKE, CATALASE INHIBITION AND CADMIUM THIONEIN PRODUCTION IN THE KILLIFISH (FUNDULUS HETEROCLITUS) INDUCED BY EXPERIMENTAL CADMIUM EXPOSURE,
Southeastern Massachusetts Univ., North Dartmouth. Dept. of Biology.
R. J. Pruell, and F. R. Engelhardt.
Marine Environmental Research, Vol 3, p 101-111, 1980. 5 Fig, 1 Tab, 16 Ref.

Descriptors: *Cadmium, *Toxicity, *Killifishes, Heavy metals, Inhibition, Enzymes, Biochemistry, Fish physiology, Animal metabolism, Copper, Chemical analysis, Mode of action, Bioassay, *Tissue analysis, *Bioaccumulation, *Liver.

Liver catalase activity was used as an index of cadmium poisoning in the killifish, Fundulus heteroclitus, and was found to be inhibited following both in vivo and in vitro exposure to dissolved cadmium at a concentration greater than 1 mg/litre. Pre-exposure at 1 mg Cd/litre prevented catalase inhibition at higher subsequent doses of cadmium. Comparison of the effects of in vivo and in vitro exposure showed in vivo exposure to cadmium to result in greater catalase inhibition. Cadmium and copper binding was determined by gel chromatography and found to occur at three distinct liver cytosol fraction peaks. Both metals showed enhanced cytosol concentrations with cadmium exposure and relative changes in peak levels as related to cadmium exposure regimes. Cadmium thionein (molecular weight of 7-10,000) was found in the killifish liver and was correlated with adaptive responses in liver catalase activity. High molecular weight cadmium binding was found to be a better index of cadmium toxicity to liver catalase than total liver cadmium concentration. (Deal-EIS)

HEAT PUMP UPDATE,
National Water Well Association, Worthington, OH.
D. Bacon.
Water Well Journal, Vol 34, No 2, p 37, February, 1980. 1 Fig.

Descriptors: *Heat pumps, *Environmental effects, *Computer models, On-site investigations, Effluents, Waste water disposal, Thermal pollution, Injection wells, Ground water.

The National Water Well Association and the University of Missouri, Rolla are examining the effects

of heat pump effluent injection on ground water temperature distribution and chemical equilibria. Hydrogeologic and climatologic data from a field site will be used to develop a computer model that will predict the nature and distribution of thermal plumes resulting from injection of heat pump discharge water under various conditions. This model will eventually predict the environmental impact resulting from high-density usage of ground water heat pumps. (Purdin-NWWA)

PHOTOSYNTHESIS AND GROWTH OF SPIRULINA PLATENSIS (CYANOPHYTA) IN AN EQUATORIAL LAKE (LAKE SIMBI, KENYA),
California Univ., Santa Barbara. Dept. of Biological Sciences.
J. M. Melack.
Limnology and Oceanography, Vol 24, No 4, p 753-760, July 1979. 4 Fig, 4 Tab, 19 Ref. NSF GB8328X and BMS 75-03441.

Descriptors: *Lake Simbi(Kenya), *Photosynthesis, *Growth rates, *Chlorophyll, *Spirulina, Cyanophyta, Euphotic zone, Dissolved oxygen, Volcanoes, Craters, Phytoplankton, Primary productivity, Limnology, Analytical techniques, Methodology, Physicochemical properties, Plant growth, Secchi disks, Surface waters, Kenya.

Abundance, growth and photosynthetic rates of a unialgal population of Spirulina platensis in Lake Simbi, Kenya were investigated August 1973-May 1974 and November 1976. Chlorophyll-a concentrations and S. platensis numerical abundance are usually exceptionally high within 1 m of the surface. During morning calm period S. platensis trichomes often accumulate at the surface. Maximal photosynthetic rates are usually high and vary 950-12,900 mg 02/cu m h; areal photosynthetic rates, determined by depth profile planimetry, range 620-5,220 mg 02/sq m h. Photosynthetic capacity in Lake Simbi is variable. Maximal photosynthetic capacity values range 1-19 mg 02/mg chl-a h and values for the euphotic zone vary 1-11.2 based on bottled phytoplankton. Estimates of maximal photosynthetic capacity for the euphotic zone range 7.1-24.2 mg 02/mg chl-a h based on free water determinations of dissolved oxygen. Exceptionally high photosynthetic rates are due to the extraordinary chlorophyll-a content in the euphotic zone (200-650 mg chl-a/ sq m). Growth rate measurements based on actual weight changes yield turnover times of 8.9-18.9 h. Lake Simbi lies 1,142 m a.s.l. and occupies a volcanic explosion crater 1 km from Lake Victoria. Seston are dull green because of dense S. platensis suspensions. Secchi disk readings vary 21-70 cm. Waters are alkaline and saline. (Danovich-Wisconsin)

GROWTH AND LONGEVITY IN THE CRUSTOSE RED ALGA PETROCELIS MIDDENDORFFII,
Washington Univ., Seattle. Dept. of Zoology.
R. T. Paine, C. J. Slocum, and D. O. Duggins.
Marine Biology, Vol 51, No 2, p 185-192, 1979. 5 Fig, 1 Tab, 25 Ref.

Descriptors: *Rhodophyta, *Plant growth, *Waadah Island(WA), *Life history studies, *Age, *Intertidal areas, Benthic flora, Growth rates ecology, Rocks, Algae, Distribution, Population dynamics, Mortality, Plant populations, Plant morphology, Photography, Polargraphic analysis, Petrocelis middendorffii.

Petrocelis middendorffoii, a noncalcareous red alga living in the middle-upper portion of an intertidal zone on Waadah Island, Washington, grows slowly; recruitment and mortality rates are low and the alga is capable of attaining great age. Observations were made at Waadah Island near Neah Bay, Washington, April 1970-August 1977. Total spatial separation of the four clusters studied was less than 17 m; however, indications of regional performance synchrony within this limited area were not observed. Some plants were growing; others were fragmenting. Plant surface area increased 4%/yr for those individuals growing. Age estimates, based on various growth rates, suggest that an average sized plant, 123 sq cm, is 25-87 years old. Plants of small or reduced area are more susceptible to death than larger ones; however, death does not directly relate to plant age. Causes of mortality are unknown. All plant portions are readily accessible to molluscan grazers, three of which, Collisella digitalis, Littorina sitkana and L. scutulata, are locally common. Plant periphery areas may be less edible than the central portion and the latter has an excellent capacity to re-establish itself, probably from those portions retained in the rock matrix. Petrocelis is a crustose sporophyte, prodicing tetraspores, which in turn give rise to a foliose dioecious gametophyte. Each P. middendorffii site was photographed at 1-6 mo intervals; photographs were projected and the algal surface area measured with a compensating polar planimeter. (Danovich-Wisconsin)

CONTINUOUS PLANKTON RECORDS: SEASONAL CYCLES OF PHYTOPLANKTON AND COPEPODS IN THE NORTH ATLANTIC OCEAN AND THE NORTH SEA,
Institute for Marine Environmental Research, Plymouth (England).
J. M. Colebrook.
Marine Biology, Vol 51, No 1, p 23-32, 1979. 10 Fig, 18 Ref.

Descriptors: *Phytoplankton, *Seasonal, *Copepods, *North Sea, *Atlantic Ocean, *Distribution, Water temperature, Upwelling, Overwintering sites, Spatial distribution, Temporal distribution, Population dynamics, Surface waters, Graphical analysis, Timing, Thermocline, Grazing, Correlation analysis, Coasts, Surveys, Growth rates, Standing crops.

Data from the Continuous Plankton Recorder survey of the North Atlantic Ocean and North Sea, 1960-1976, show that a key distribution factor for phytoplankton is the timing of the spring increase; copepod abundance is determined by the length of time food is available rather than food amounts. Distribution of overwintering stocks also influences seasonal distributions. Phytoplankton increases correlate with seasonal temperature ranges. Rapid spring increases in phytoplankton standing stocks occur over most of the open ocean which, compared with shallow water areas , si underexploited by grazing. Due to low overwintering stocks and longer generation times, copepods are unable to increase quickly enough to graze down phytoplankton within the limited growing season. In the open ocean, spring phytoplankton increases correspond with spring warming of surface waters. In the North Sea, the spring increase occurs earlier, associated with transient vertical stability periods. This results in a relatively slower increase rate. Exceptionally early spring phytoplankton increases off the Norwegian shelf and west coast of Greenland are associated with permanent haloclines. West Greenland has an exceptionally high phytoplankton standing stock relative to copepods for the whole productive season, due to low temperatures which restrict copepod development. High, late autumn, phytoplankton peaks off the coast of Portugal are due to coastal upwelling. The Grand Banks off Newfoundland are characterized by very sharp, high, spring phytoplankton peaks due to regional shallowness and low temperatures which restrict copepod growth. (Danovich-Wisconsin)

THE UPTAKE OF UREA BY THE DIATOM, PHAEODACTYLUM,
University Coll. of Swansea (Wales). Dept. of Botany and Microbiology.
T. A. V. Rees, and P. J. Syrett.
The New Phytologist, Vol 82, No 1, p 169-178, January 1979. 7 Fig, 3 Tab, 10 Ref.

Descriptors: *Ureas, *Diatoms, *Metabolism, *Kinetics, *Cytological studies, *Absorption, Nitrogen, Light, Plant physiology, Ammonium compounds, Phaeodactylum, Diffusion, Cultures, Laboratory tests, Chromatography, Darkness, Photoactivation, Nutrients, Nutrient requirements, Cycling nutrients, Tracers.

Urea-grown Phaeodactylum cells possess an active transport mechanism with a high-affinity for urea; presumably such high-affinity active mechanisms allow phytoplankton to utilize nitrogenous compounds at low, naturally-occurring, sea water concentrations. The mechanism leads to C14 accumulation in cells; 80% of C14 is recovered from cells as unchanged C14-urea. C14-urea uptake rates are much faster than passive diffusion rates; the half-saturation constant varies 0.6-1.0 microM. Uptake, low in cells cultured with ammonium as the nitrogen source actively develops when these cells are incubated in nitrogen-free medium for 24 h. Cycloheximide additions stop this development, indicating dependence on protein synthesis and a specific membrane protein. Uptake activity, but not urea affinity, is greatly stimulated when urea-grown cells are deprived of nitrogen 10-24 h. C14-urea uptake continues until a constant level is attained within the cells; this plateau value results from a balance between active urea uptake rates and passive diffusion loss rates. Urea transport takes place in both light and darkness, but in nitrogen-replete cells, rates in darkness are slow and are greatly stimulated by illumination. DCMU does not cause significant inhibition; however, CCCP causes almost complete inhibition, indicating that light stimulation occurs by ATP arising from photophosphorylation. (Danovich-Wisconsin)

THE OCCURRENCE OF A HYPERSENSITIVE REACTION IN THE PLANKTONIC DIATOM ASTERIONELLA FORMOSA HASSALL PARASITIZED BY THE CHYTRID RHIZOPHY-

DIUM PLANKTONICUM CANTER EMEND., IN CULTURE,
Freshwater Biological Association, Windermere (England).
H. M. Canter, and G. H. M. Jaworski.
The New Phytologist, Vol 82, No 1, p 187-206, January 1979. 2 Fig, 3 Tab, 30 Ref.

Descriptors: *Diatoms, *Fungi, *Parasitism, *Resistance, Metabolism, Cultures, Laboratory tests, Hosts, Microbiology, Microscopy, Infection, Mortality, Spores, Population, Growth stages, Asexual reproduction, Asterionella formosa, Rhizophydium planktonicum, Plant physiology, Cytological studies.

Hypersensitive reactions of plant cells in response to fungal parasitism takes place between cells of freshwater planktonic diatom Asterionella formosa clone CRB05 when infected by chytrid Rhizophydium planktonicum clone C2. Experiments show that most cells which react at a hypersensitive level result in failure of chytrids to increase and reach epidemic proportions on particular diatom clones in culture. Within Asterionella clone CRB05, hypersensitivity protects the total population from increasing parasitism but this does not protect individual cells. Cell reactions, either compatible or hypersensitive and incompatible, together with relative populations, make for a successful or unsuccessful host-parasite relationship. Most diatom Asterionella formosa cells in this study exhibit a hypersensitive death reaction in response to chytrid infections. On these incompatible cells, the fungus died and the encysted zoospore did not enlarge into a sporangium. However, compatible cells did bear sporangium in rare instances. Throughout this study, 4000 hypersensitively killed cells of Asterionella clone CRB05, each bearing one zoospore, were recorded. In contrast, fungus development beyond the zoospore stage occurred in only 20 cells. Therefore, most parasitized cells are classed as incompatible (hypersensitive). Experiments focused on detailed high-power light-microscope observations of numerous algal and fungal cells. (Danovich-Wisconsin)

SIZE-SELECTIVE PREDATION OF ZOOPLANKTON,
Ithaca Coll., NY. Dept. of Biology.
J. L. Confer, and G. Applegate.
The American Midland Naturalist, Vol 102, No 2, p 378-383, October 1979. 1 Fig, 2 Tab, 18 Ref. NSF URP SMI176-83107.

Descriptors: *Zooplankton, *Predation, *Food habits, *Particle size, Browse utilization, Animal behavior, Food chains, Diaptomus sicilis, Diaptomus pallidus, Daphnia pulex, Daphnia magna, Cyclops vernalis, Macrocyclops albidus.

Selection of prey by three species of predacious zooplankton species was analyzed. One three predators (Epischura lacustris, Macrocyclops albidus, and Cyclops vernalis) and three to ten prey (Diaptomus sicilis, D. pallidus, Daphnia pulex, and D. magna) were placed into aquaria. All aquaria were examined every 24 hours. The results were expressed as number of prey killed rather than eaten. The number of prey killed per predator/day ranged from 0.2 with Cyclops vernalis up to 4.2 with Macrocyclops albidus. Estimated predation rates showed large weekly variations. These variations may reflect real differences that occur in nature over a short time interval. Higher rates of predation were observed at higher densities. When offered a choise of prey, the predators generally selected the smallest prey and avoided the largest prey. In some experiments selection for the smallest prey occurred regardless of whether the smallest prey was a copepod or a cladoceran. The smallest prey used in these experiments were not as small as some which are available to zooplankton in lakes. Consequently, the results of the experiments do not necessarily suggest the smallest prey that the predators are capable of eating, nor the size of prey that the predators would prefer when a natural range of sizes is available. A CONTRIBUTION TO THE PHOSPHORUS LOADING CONCEPT,
Technische Univ., Dresden (German, D.R.). Bereich Hydrobiologie.
J. Benndorf.
Internationale Revue der Gesamten Hydrobiologie, Vol 64, No 2, p 177-188, 1979. 3 Fig, 2 Tab, 28 Ref.

Descriptors: *Eutrophication, *Model studies, *Orthophosphate, *Detention reservoirs, Estimating equations, German Democratic Republic, Organic loading, Phosphorus, Phytoplankton, Sedimentation, Growth rates, Light intensity, Reservoirs, Cycling nutrients.

Two modifications were tested on the empirical eutrophication model developed by Vollenweider and Dillon (1974) and Vollenweider (1976): (1) Total phosphorus is replaced by orthophosphate phosphorus; (2) An outwash limit is introduced for very short residence times. The new orthophosphate-related constants of the model have been calculated for reservoirs. These new values differ from the original constants chiefly in that the new sinking velocity values for oligotrophic reservoirs are different from values for mesotrophic and eutrophic man-made lakes. This difference is caused by the vertical stratification of orthophosphate and the deep water outlet from reservoirs. The time-dependent outwash limit is also calculated from the equation. Critical orthophosphate load limits have been checked using mean values from 19 reservoirs and primary reservoirs located in the German Democratic Republic. A high degree of conformity between the model and the measured eutrophication state has been found. In addition, the outwash limits have been tested by means of random sampling at the primary reservoirs Weida and Bautzen. Of 17 samples only one did not fit the model. (Harris-Wisconsin)

THE CHEMISTRY OF LAKE MYVATN AND RIVER LAXA,
Marine Research Inst., Reykjavik (Iceland).
J. Olafsson.
Oikos, Vol 32, No 1-2, p 82-112, 1979. 16 Fig, 22 Tab, 46 Ref.

Descriptors: *Water chemistry, *Lake Myvatn(Iceland), *River Laxa(Iceland), Eutrophication, Nitrogen, Phosphorus, Cyanophyta, Anabaena flos-aquae, Hypolimnion, Diatoms, Lake morphology, Cycling nutrients, Iceland, Nutrients.

High phosphorus loading of Lake Myvatn, Iceland is the primary cause of the dense algal blooms which develop in the lake. The nitrogen/phosphorus ratio is too low for green algae. However, the excess phosphorus is utilized by blooms of the nitrogen fixing blue-green alga Anabaena flos-aquae. As a result of the high production rate of organic matter in winter in the lake, oxygen-deficient conditions may develop in some parts of the lake. The lake has a short water retention time. However, much of the hypolimnion is isolated under the ice by thermal stratification from the water flowing through the lake. The diatom mining operation in the Ytrifloi basin exceeds the rate of sediment deposition and is responsible for changes in the morphological characteristics of the basin. By 1977 the volume of the lake has increased by 32%. In addition, the mining operation has also affected the nutrient chemistry of the springs which drain into the basin. Phosphorus and nitrogen loading rates have increased by 20% and 96% respectively, and at present only a fraction of the mobilized nutrients find their way back to the lake. Decrease in phosphorus content of the mining effluents would be desirable. Phosphorus decrease would cause a decrease in the annual production of algal biomass and a change in the nitrogen/phosphorus ratio which in turn would eliminate many of the nitrogen fixing algae such as Anabaena that cause periodic algal blooms in the lake. (Harris-Wisconsin)

SECONDARY PRODUCTION OF EPILITHIC FAUNA IN A WOODLAND STREAM,
Massachusetts Univ., Amherst. Dept. of Forestry and Wildlife Management.
R. J. Neves.
The American Midland Naturalist, Vol 102, No 2, p 209-225, October 1979. 1 Fig, 6 Tab, 75 Ref.

Descriptors: *Secondary productivity, *Streams, *Epilithic fauna, *Aquatic insects, Factory Brook(MS), Trophic level, Benthos, Food chains, Biomass, Diptera, Ephemeroptera, Trichoptera, Plecoptera, Massachusetts.

In July 1973 three sets of 40 cobblis were placed across a riffle in Factory Brook, Massachusetts in order to sample the biomass and productivity of epilithic fauna. One 40-cobble set was sampled each month from September 1973 to August 1975, allowing three months for recolonization. Insect order according to numerical abundance were Diptera (55.8%), Ephemeroptera (31.9%), Trichoptera (7.3%), and Plecoptera (1.8%) for the two-year period with little variation between years. In 1975 the mean faunal density was 3088 individuals/sq m. Seasonal changes in epilithic fauna generally reflected differences in numerical abundance during the year. Mayflies dominated cobble biomass, followed by caddis flies, stone flies and dipterans; the occurrence of other orders was extremely variable but significant during several months. Total biomass on cobbles amounted to 646.7 mg dry weight/sq m/year in 1974 and 610 mg dry weight/sq m in 1975. Estimated annual production on cobbles during 1974 was 4804.9 mg dry weight/sq m/year and 4315.1 mg dry weight/sq m/year in 1975. Most of the invertebrate production on cobbles was attributed to relatively few abundant and common species. Predators made up 18.5-20.4% of the biomass and contributed 11.1-13.6% of invertebrate production on cobbles. The remaining biomass and production was attributed to herbivores and detritivores. Annual energy production was 24.7 kcal/sq m in 1974 and 22.3 kcal/sq m in 1975. (Harris-Wisconsin)
W80-04658

THE OXYGEN BALANCE OF LAKE MYVATN, ICELAND,
Miljoestyrelsen, Silkeborg (Denmark). Freshwater Lab.
C. Hunding.
Oikos, Vol 32, No 1-2, p 139-150, 1979. 11 Fig, 7 Tab, 30 Ref.

Descriptors: *Lake Myvatn(Iceland), *Oxygen, *Primary productivity, Oxygen demand, Eutrophication, Benthos, Water temperature, Oxygenation, Cladophora aegagropila, Diatoms, Photosynthesis, Sediment-water interfaces, Iceland, Phytoplankton.

During 1973 and 1974 in-situ limnological experiments were conducted at Gardsvogar Beach, Lake Myvatn, Iceland. In this area, cold spring water overflows sediment submerged only 0.5 m below the water surface, and keeps it clean of detrital material. The purpose of the experiments was to quantify the rates of benthic microalgal production and community respiration by following the oxygen change in the water over the sediment in light and dark undisturbed sediment cores. Oxygen uptake of the sediment community correlated with the temperature of the water over the sediment. Variations of water movement over the sediment also affected the rate of community oxygen uptake. Based on measured values of oxygen production and uptake of the sediment community, daily oxygen production was calculated at about 800 mg 02/sq m, and community oxygen uptake at about 1300 mg 02/sq m during July-August. Net oxygen change amounted to +689 mg 02/cu m from 0600 to 2040 hours, and -576 mg 02/cu m from 2040 to 0600 hours. Daily net oxygen production at 80 cm water depth was +113 mg 02/cu m. Colonies of Cladophora which grew on the bottom of the central parts of the lake were locally abundant and reached densities of 1,800,000 individuals/sq m in 1973. They were well adapted to illumination intensities at the sediment surface. In spite of the positive daily oxygen balance of the lake, a marked decline in oxygen balance occurred during storms due to increased oxygen uptake by the suspended sediments. (Harris-Wisconsin)

W80-04661

ZOOPLANKTON AND ITS RELATION TO AVAILABLE FOOD IN LAKE MYVATN,
National Energy Authority, Reykjavik (Iceland).
H. Adalsteinsson.
Oikos, Vol 32, No 1-2, p 162-194, 1979. 25 Fig, 4 Tab, 113 Ref.

During the ice-free seasons in 1972 and 1973 and the ice-bound season in 1972, water samples were taken from 16 stations evenly distributed through all three basins of Lake Myvatn, Iceland. The whole water column was sampled at each station. The number of individuals from different zooplankton taxonomic groups was counted in each sample. Biomass of phyto- and zooplankton was estimated by calculating the volumes of the geometric configurations of the organisms. Due to shallowness of the lake (ca. 2 m) sediment is often suspended and quantitatively dominates phytoplankton. Among the phytoplankton, chrysomonads dominate in winter. After ice break they are replaced by diatoms. These in turn are followed by a new peak of chrysomonads. Anabaena flos-aquae dominates during summer, and diatoms again during autumn. Among the zooplankton, Cyclops abyssorum Sars is dicyclic, with the first generation appearing in spring and the second in July-August. The total zooplankton production was 30-100 g fresh weight/sq m. Annual fluctuations were mainly dependent on Daphnia production. Phytoplankton biomass averages 2-2.5 times higher, and production 10-20 times higher than corresponding values for zooplankton. The differences in the zooplanktonic species composition between the three basins of the lake are caused by the combination of the following factors: bloom of Anabaena, fish predation, and sediment suspension. (Harris-Wisconsin)

PHYTOPLANKTON PRODUCTION IN SHALLOW EUTROPHIC LAKE MYVATN, ICELAND,
Copenhagen Univ., Hillerod (Denmark). Freshwater-biological Lab.
P. Jonasson, and H. Adalsteinsson.
Oikos, Vol 32, No 1-2, p 113-138, 1979. 21 Fig, 9 Tab, 76 Ref.

Descriptors: *Lake Myvatn(Iceland), *Phytoplankton, *Primary productivity, Eutrophication, Water temperature, Ice cover, Opacity, Light penetration, Cycling nutrients, Radiation, Chlorophyll, Benthos, Diatoms, Photosynthesis, Chrysophyta, Anabaena flos-aquae, Seasonal, Iceland, Solar radiation.

Lake Myvatn is a shallow eutrophic lake in northeastern Iceland consisting of three irregular basins. During the six year period between 1971-1976, samples for measurement of primary gross production were collected at six stations on the lake. In addition, physical and chemical properties of the lake environment, such as water temperature, ice cover, global radiation, transparency, wind speed, resuspension and nutrient budget, were measured. The southern basin produced 118 g C/sq m/year; the northern basin produced 75 g C/sq m/year; and the eastern basin produced 50 g C/sq m/year. Availability of phosphorus seems to limit phytoplankton production. Seasonal succession of phytoplankton followed a trend similiar to that of temperate eutrophic lakes. The phytoplankton succession was: diatoms in spring and autumn, chrysophyceans in early summer and autumn, Anabaena flos-aquae in summer. The chlorophyll content was low in spring and early summer and dropped rapidly after the high values during the Anabaena bloom. Intermittently high values observed regularly in autumn were associated with resuspended benthic diatoms. High production due to Anabaena coincided with high radiation, high temperature and the time of ice-break. Despite high biomass, production was low at other seasons. The interrelationship between chlorophyll-a, biomass production and turnover time of phytoplankton are also discussed. (Harris-Wisconsin)

ACUTE TOXICITY OF RESIDUAL CHLORINE AND AMMONIA TO SOME NATIVE ILLINOIS FISHES,
Illinois State Water Survey, Urbana.
D. P. Roseboom, and D. L. Richey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-170871, Price codes: A03 in paper copy, A01 in microfiche. Report of Investigation 85, 1977. 42 p, 10 Fig, 61 Ref, 5 Append.

Descriptors: *Chlorine, *Ammonia, *Illinois, *Water quality standards, *Water pollution effects, Water temperature, Freshwater fish, Bioassay, Toxicity, Mortality, Laboratory tests, Channel catfish, Bass, Sunfishes.

Ninety-six hour residual chlorine bioassays were conducted on bluegill and channel catfish. In 96-hour acute toxicity studies with ammonia (NH_3-N), bass in addition to bluegill and channel catfish, were included. The studies were performed in waters typical of most lakes and streams in midwestern states, i.e., relatively high in alkalinity and the salts of calcium and magnesium. Observations regarding the characteristics and reaction of the fishes to each toxicant were noted. For residual chlorine the 96-hour TL50s ranged from 0.18 to 0.33 mg/l for bluegill, depending on temperature and fish weight. For channel catfish the TL50 was about 0.09 mg/l; temperature was not a factor. For ammonia the 96-hour TL50s for bluegill were dependent on temperature and fish weight and varied from 0.40 to 1.3 mg/l. Size was not a factor for bass and channel catfish. Ninety-six hour TL50s for these fishes ranged from 0.72 mg/l at 22C to 1.2 mg/l at 30C for bass and 1.5 mg/l at 22C to 3.0 mg/l at 28C for channel catfish. For the protection of the fishes investigated, and consistent with the water pollution regulations of Illinois, residual chlorine in Illinois waters should not be detectable and NH_3-N should not exceed a concentration of 0.04 mg/l.

RESPONSE OF BIOLOGICAL REACTORS TO THE ADDITION OF POWERED ACTIVATED CARBON,
Connecticut Univ., Storrs. Dept. of Chemical Engineering.
D. W. Sundstrom, H. E. Klei, T. Tsui, and S. Nayar.
Water Research, Vol 13, p 1225-1231, 1979. 11 Fig, 5 Ref. OWRT A-057-CONN(2).

Descriptors: *Activated sludge, *Activated carbon, *Sewage treatment, Biological treatment, Phenols, Sludge treatment, Waste treatment, Water quality, Control, Sewage effluents, Municipal wastes, Industrial wastes.

A biological reactor operating on a synthetic feed was subjected to impulse and step disturbances of glucose and phenol. Powdered activated carbon was applied either as an impulse or as a step change to control reactor conditions. With glucose as the substrate, the addition of powdered carbon reduced the steady state TOC concentrations significantly but only slightly moderated the concentration transients after an upset. For impulse inputs of phenol, the simultaneous addition of carbon greatly reduced the magnitude of the transient changes in concentration. With step inputs of phenol, carbon addition rapidly lowered the phenol concentration in the reactor and permitted continuous operation with inlet phenol concentrations above 1000 mg/l. Thus, powdered carbon can provide an effective control method for maintaining effluent quality in the presence of toxic upsets. (Deal-EIS)

BEHAVIOUR OF FISH IN A THERMALLY DIFFERENTIATED ENVIRONMENT,
Instytut Rybactwa Srodladowego, Warsaw (Poland). Heated Waters Lab.
L. Horoszewicz, and B. Morawska.
Polish Ecological Studies, Vol 5, No 3, p 33-42, 1979. 5 Fig.

Descriptors: *Water temperature, *Thermal water, Electric power plants, *Fish behavior, Fish migration, *Fish physiology, Fresh water fish, Warm water fish, *Salmon, Atlantic salmon, *Preferred temperature, *Lethal temperature, Juvenile fish, Fish populations, *Vistula River(Poland), *Poland.

Discharge canals and heated zones are not totally abandoned by fish even at highest summer temperatures of water reaching 30-35C. Warm-water fishes form local populations adapted to elevated temperatures in the heated areas of water. Heated environments become areas of intensive reproduction of these fish species which in changed thermal, hydrological and morphological conditions of a water body find suitable conditions for spawning, that is a suitable substratum, flow, depth and temperature for spawning. Migratory salmonid fish do not acclimate to the high temperatures of discharge waters, and the ability to select cool currents makes it possible for these species to pass the heated areas of rivers and lakes even during the warmest periods. In comparing the above observations and the preferred temperatures of local species of fish laying between 9 and 28C, with the exception of salmonids, with predicted heating of waters, one can assume that for most fish species in the Vistula River, the temperatures of heated zone will be attractive, with the exception of the summer period with its low water level and temperatures exceeding 28.5C. Such temperatures were avoided by juveniles of three species, although adult individuals of two of these species and five other species were caught at higher temperatures reaching 33.5C. This does not by any means signify that such species will always occur in large numbers in discharge areas. (Katz-EIS)

P. Epler, and K. Bieniarz.
Polish Ecological Studies, Vol 5, No 3, p 52-63, 1979. 6 Fig, 3 Tab.

Descriptors: *Water pollution effects, *Fish physiology, *Fish behavior, Aquiculture, Growth, Fish reproduction, Fish eggs, Egg development, *Water temperature, Heated effluent, Thermal electric power, *Poland, *Vistula River(Poland), Fresh water fish, Premature spawning.

Increase in water temperature in the Vistula River will have the following undesireable effects on the reproduction of fish. These are premature spawning, and disturbed development of the fish eggs. The following favorable effects may be observed; the earlier spawning of many fish species, an increase in the number of spawnings and a prolongation of the spawning period. The authors feel that in the Vistula River the unfavorable changes will be balanced by favorable changes although not always in the same species. (Katz-EIS)

SPAWNING OF FISH AND THEIR EMBRYONIC AND LARVAL DEVELOPMENT,
Wroclaw Univ. (Poland). Muzeum Zoologiczny.
B. Kokurewicz.
Polish Ecological Studies, Vol 5, No 3, p 64-71, 1979. 3 Fig.

Descriptors: *Fish physiology, *Fish behavior, *Fish reproduction, Water pollution effects, *Water temperature, Thermal pollution, Thermal power, *Thermal power plants, Aquiculture, Spawning periods, Heated environments, Fish eggs, Fresh water fish, *Vistula River(Poland), *Poland.

Comparison of spawning periods of fish in natural waters with changes taking place in heated environments allows for assuming the following conclusions. Spawning in heated zones will take place earlier and at optimal temperatures or temperatures tolerated for embryonic development (perch, pike-perch, roach). One other possibility is an earlier spawning and prolonging the period of reproduction by increasing the number of batches (tench, bleak, bream). Danger to the reproduction of phytophilus fish in heater environments is not caused by temperature increase, but by the lack of spawning grounds. The latter can be destroyed a result of regulating and embanking the river, or due to the fact that temperature increase precedes spring rising of waters. Fish may be ready to spawn earlier and as result of the lack of suitable spawning grounds (for example on areas flooded later) depositing of spawn can be retarded. Similarly as spawning, embryonic development should likewise take place within the range of optimal temperatures, that is increasing gradually from mid-February to the end of June from 10 to 24C. Fish species such as the bleak, rudd, tench, commencing multi-batch spawning in warm waters can meet with high temperatures of over 28C in July and August, that is unfavorable for reproduction toward the end of the reproducing period, especially at low water levels. Reducing the period of embryonic development can be favorable providing temperature increase will remain within the range of temperatures optimal for the development of a given fish species. GROWTH OF FISH IN HEATED ENVIRONMENTS,
Instytut Rybactwa Srodladowego, Olsztyn-Kortowo (Poland). Dept. of Ichthyology.
H. Wilkonska.
Polish Ecological Studies, Vol 5, No 3, p 80-85, 1979. 2 Fig.

Descriptors: *Fresh water fish, *Fish growth, *Vistula River(Poland), *Poland, *Cooling water, Juvenile fish, Adult fish, *Thermal effluents, Perch, Fisheries, Water temperatures, Water pollution Effects, Thermal power plant, Low water flow.

Heating of the Vistula River will result in an increased growth rate of juveniles of most species occurring in the heated area. Predicted increase of temperature above 28C in case of low water flow (June, July, August) can inhibit the growth of fish, and should be lowered by proper changes of power plant performance. Although warm-water species form local populations in heated zones, no significant changes are to be expected with respect to growth rate of adult fish in the Vistula, this being due to stream-like discharge of heated effluents and its rapid cooling along a short stretch (no more than a few hundred meters) of the river. TEMPERATURE CHANGES AND FISH DISEASES,
Instytut Rybactwa Srodladowego, Piaseczno (Poland). Dept. of Fish Culture.
B. Pietrzak.
Polish Ecological Studies, Vol 5, No 3, p 86-94, 1979. 1 Fig, 3 Tab.

Descriptors: *Fish diseases, *Fish parasites, *Fish physiology, Fish behavior, Water pollution effects, Thermal power plants, Cooling waters, *Water temperature, Fish pathogen, Immunological responses, Bacteria, Virus, Thermal optimum, Fish parasites.

Changes of one environmental factor, in this case temperature, which favor the development of some pathogens and inhibit others, do not necessarily mean that certain fish diseases will occur, and other - disappear. It is worth to repeat after Snieszko (1974) that a disease occurs when there is a virulent pathogen, a susceptible host (i.e. fish), and proper environmental conditions. Temperature, although important, constitutes only one of many environmental factors. Our predictions, based on only scarce data, should be treated rather as a warning; they point to some possibilities, but there are no bases for assuming that these or other diseases and parasite invasions will occur after heating of the river. Predicted temperatures of the Vistula River affected by heated effluents will create conditions favouring immunological processes in cyprinids. At the same time bacteria will find favourable thermal conditions over a prolonged period. In case of viral diseases, their thermal optima will last two months longer than in natural environments. It is also possible that invasions of parasites will be intensified. (Katz-EIS)

CHANGES OF FISH COMMUNITIES IN HEATED ENVIRONMENTS,
Instytut Rybactwa Srodladowego, Warsaw (Poland). Heated Waters Lab.
L. Horoszewicz.
Polish Ecological Studies, Vol 5, No 3, p 95-99, 1979. 1 Fig.

Descriptors: *Water pollution effects, *Fish populations, *Fish reproduction, Fish behavior, Fish migration, *Vistula River(Poland), *Poland, Cooling water, Discharge channels, Fresh water fish, Reservoirs, Fish fauna, Aquatic plants.

Comparison of the trends taking place in fish communities in different reservoirs in a variety of environments quite clearly points to species capable of invading or at least of maintaining their dominance in heated environments of the temperate climatic zone, now matter how differentiated. Beginning from the most plastic and vigorous ones, these species can be arranged as follows: bleak, roach, bream, and white bream. Two other species - rudd and chub - are common components of fish fauna in heated waters, but they exclude each other as dominants. Most frequently, predomination of one of them is determined by flow rate, and thus by amount and type of submerged water vegetation. This statement is supported by chub catches at mouths of discharge canals in both water bodies under study (Ivankovskoe and Kucurgan), as well as by visible increase of chub numbers in Lichenskie and Slesinskie lakes in the last 3 years of studies i.e. after the introduction of safety cooling system. As regards predatory species, perch is most frequently found in heated waters whereas pike disappears. Some increase of crucian carp, tench, carp, and pike-perch may be noted in water bodies with abundant vegetation, and of bass and bullhead catfish in heated flowing waters. Response of undermouth and barbel is still unclear. It is probable that both species periodically migrate from cool to heated parts. There are on data sufficient for predicting the responses of other not abundant and sporadically occurring fish species. (Katz-EIS)

UPTAKE AND ELIMINATION OF ANTIMONY IN THE MUSSEL, MYTILUS EDULIS,
Institute fuer Meeresforschung, Bremerhaven (Germany, F.R.).
F. Walz.
Veroffentlichungen des Institut fur Meeresforschung in Bremerhaven, Vol 18, p 203-215, 1979. 4 Fig, 1 Tab, 23 Ref.

Descriptors: *Metals, *Absorption, *Mussels, *Toxicity, Mortality, Mode of Action, Chemical properties, Path of pollutants, Mathematical models, Animal physiology, Animal metabolism, Animal growth, *Antimony, *Tissue analysis, *Bioaccumulation, *Depuration.

In experiments of 186 days, antimony (as antimonyl-tartrate) showed no toxic effects up to concentrations (nominal) of 5 mg Sb/l. At 10 mg Sb/l some mortality occurred, and shell deformations. 17-20 mm Mytilus edulis accumulate antimony from sea water with concentration factors (on the basis of dry weight of total tissues) of 59-103, higher values at concentration 5 mg Sb/l, lower values at 0.15 mg Sb/l. Uptake is more or less linear during the initial phase of experiments (about 30 days) until steady state conditions are reached. In elimination experiments biological half life time is 17.8 days, regardless of initial concentrations in tissues. The monocompartment model of Ruzic is an imperfect description of uptake kinetics; probably a multicompartment model is needed. (Deal-EIS)

THE CONTENT OF CERTAIN METALS IN THE SOFT TISSUES OF THE BIVALVE MOLLUSKS TRIDACNA SQUAMOSA FROM ISLANDS OF THE TROPICAL ZONE OF THE PACIFIC OCEAN IN CONNECTION WITH ENVIRONMENTAL CONDITIONS,
Akademiya Nauk SSSR, Vladivostok. Lab. of Geochemistry.
N. K. Khristoforova, N. N. Bogdanova, and A. I. Obukhov.
The Soviet Journal of Marine Biology, Vol 5, No 3, p 217-222, 1979. 1 Fig, 4 Tab, 7 Ref.

Descriptors: *Heavy metals, *Mollusks, *Pacific Ocean, Iron, Manganese, Copper, Zinc, Lead, Benthic fauna, Littoral, Bottom sediments, Geochemistry, Geomorphology, Pacific Ocean, Bagaman Island, *Tissue analysis, *Tridacna.

The content of the heavy metals Fe, Mn, Cu, Zn, and Pb in the soft tissues of Tridacna inhabiting the inshore waters of islands of early origin is determined. It is shown that the trace element composition of mollusk tissues depends on the geomorphology of the islands, chemical composition of the substrate, content of metals in the water, and the dynamics of the water masses. In spite of the constant chemical composition of oceanic waters and the apparent uniformity of environmental conditions, the inshore zones of different islands are individual in their combination of hydrogeochemical parameters, which is reflected in the tissue composition of the mollusks. VARIABLES AFFECTING BODY BURDENS OF LEAD, ZINC AND CADMIUM IN A ROADSIDE POPULATION OF THE SNAIL CEPAEA HORTENSIS MULLER,
Durham Univ. (England). Dept. of Zoology.
P. Williamson.
Oecologia (Berl.), Vol 44, p 213-220, 1980. 3 Fig, 3 Tab, 76 Ref.

Descriptors: *Lead, *Zinc, *Cadmium, *Snails, Heavy metals, Path of pollutants, *Animal physiology, Animal metabolism, Regression analysis, Animal populations, Seasonal, Chemical properties, *Tissue analysis, *Bioaccumulation.

Application of multiple regression analysis to the lead, zinc and cadmium contents of 985 Cepaea hortensis collected from a suburban roadside site over two years showed that body weight, age and daylength were the major factors affecting soft tissue body burdens. Other highly significant influences were physiological changes at the juvenile-adult transition, vapour pressure deficit for the two days before sampling, and mean rainfall for the ten days before. Together these factors accounted for 69%, 79% and 87% of the total variance in lead, zinc and cadmium body burdens respectively. Unexplained variance was provisionally ascribed to individual differences in recent diet and digestive activity. The digestive gland contained the majority of the total body burden of each metal and played an important role in lead and zinc elimination. Whereas levels of lead in C. hortensis fluctuated rapidly, zinc was exchanged more slowly, perhaps by active regulation, and cadmium was effectively immobile, accumulating progressively with age. The implications of these results to the predators of land snails, and to terrestrial monitoring programmes, are discussed. (Deal-EIS)

OIL POLLUTION AND SEABIRDS: ATLANTIC CANADA 1976-77 AND SOME IMPLICATIONS FOR NORTHERN ENVIRONMENTS,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Dept. of Fisheries and Oceans.
E. M. Levy.
Marine Pollution Bulletin, Vol 11, p 51-56, 1980. 4 Fig, 1 Tab, 8 Ref.

Descriptors: *Oil spills, *Birds, *Mortality, Canada, Atlantic Ocean, Oil, Oil pollution, Fuels, Mode of action, Arctic, Animal physiology, Chemical analysis, Gas chromatography.

Chemical analyses of the oils on dead or moribund seabirds from Atlantic Canada during the winter of 1976-77 indicated that some of the birds were contaminated with oil spilled by the Argo Merchant grounding, some by oil probably from the Grand Zenith sinking, and still others by oil from various small local spills of unknown origin. These victims demonstrated that an extremely minute oiling may lead to the death of a seabird when the effects of the oil are synergistically combined with the stresses imposed by severe environmental conditions. This may intensify the impact of oil in the Arctic and thereby have a profound effect on seabird populations. (Deal-EIS)

POLYCHLORINATED BIPHENYLS AND OTHER ORGANIC CHEMICAL RESIDUES IN FISH FROM MAJOR WATERSHEDS OF THE UNITED STATES, 1976,
Environmental Research Lab.-Duluth, MN.
G. D. Veith, D. W. Kuehl, E. N. Leonard, F. A. Puglisi, and A. E. Lemke.
Pesticides Monitoring Journal, Vol 13, No 1, p 1-11, 1979. 3 Fig, 3 Tab, 7 Ref.

Descriptors: *Polychlorinated biphenyls, *Water quality standards, *Freshwater fish, *Pesticide residues, DDT, Chlorinated hydrocarbon pesticides, Phenols, Chemical analysis, Gas chromatography, Watersheds(Basins), Chlorinated benzenes, Styrenes, Anisoles, *Tissue analysis, *Bioaccumulation, *HCB, *Chlordane, Phenols, Anilines, Propanes, Butadiene, Petroleum hydrocarbons.

Composite samples of fish were collected from major United States watersheds in 1976 and analyzed for PCBs and related organic chemicals. PCBs were found in 93 percent of the fish samples; 53 percent of the samples contained more than 5 ppm PCBs, whole fish basis, which is the current tolerance level set by the U.S. Food and Drug Administration. Only 14 percent of the samples contained less than the proposed action level of 2 ppm PCBs. PCB concentrations ranged from less than 0.3 ppm to 140 ppm in the composite samples. Sigma DDT concentrations ranged from less than 0.05 ppm to 4.53 ppm. Hexachlorobenzene was identified in 19 percent of the samples, and chlordane components were identified in 36 percent of the samples. Chemicals identified by gas chromatography/mass spectrometry but not quantified include chlorinated benzenes, styrenes, anisoles, phenols, anilines, propanes, and butadienes, as well as mixtures of petroleum hydrocarbons. EFFECTS OF URBAN RUNOFF AND TREATED MUNICIPAL WASTEWATER ON A MANMADE CHANNEL IN NORTHEASTERN ILLINOIS,
Metropolitan Sanitary District of Greater Chicago, IL.
I. Polls, C. Lue-Hing, D. R. Zenz, and S. J. Sedita.
Water Research, Vol 14, p 207-215, 1980. 7 Fig, 6 Tab, 17 Ref.

Descriptors: *Sewage effluents, *Toxicity, *Biological communities, Municipal wastes, Water quality, Sewage treatment, Runoff, Benthic fauna, Isopods, Oligochaetes, Diptera, Nutrients, Ammonia, Nitrogen, Phosphorus, Water chemistry, Illinois, Chicago River, North Shore Channel(Northeastern Ill).

The benthic macroinvertebrates and water quality were sampled monthly at five locations in the North Shore Channel (northeastern Illinois) from January through November 1973. Secondary treated effluent enters the channel from the Northside Sewage Treatment Plant, 5.4 km above its junction with the North Branch of the Chicago River. Street and combined sewer overflows located above and below the treatment plant outfall discharge to the channel only during storm events. Compared to a biological survey conducted by the U. S. Public Health Service 12 years prior, the present study revealed that the most important change in the benthic faunal composition downstream from the Northside Plant final effluent outfall was the appearance of large numbers of midges and isopods, suggesting improvement in water quality. In 1961, the fauna was composed principally of pollution tolerant oligochaetes. The 1973 study showed that the water quality in the channel was markedly influenced by a combination of both urban runoff and a point source effluent from the Northside Sewage Treatment Plant. Mean concentrations of ammonium nitrogen, nitrite-nitrate nitrogen, total phosphorus and conductivity increased significantly downstream from the treatment plant outfall compared to values upstream. INFLUENCE OF SECONDARILY TREATED KRAFT MILL EFFLUENT ON THE ACCUMULATION RATE OF ATTACHED ALGAE IN EXPERIMENTAL CONTINUOUS-FLOW TROUGHS,
Weyerhauser Co., Tacoma, WA. Environmental Technology Dept.
M. L. Bothwell, and J. G. Stockner.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 37, p 248-254, 1980. 5 Tab, 31 Ref.

Descriptors: *Pulp wastes, *Toxicity, *Diatoms, Aquatic algae, Growth rates, Seasonal, Inhibition, Pulp and paper industry, Nutrients, Nitrogen, Ammonia, Periphyton, Nitrates, Nitrites, Kraft mill effluent, Bioassay.

In three seasonal experiments in 1977, increases in the rate of attached algal accumulation were normally found with each additional increment of secondarily treated kraft mill effluent (KME). The effect of KME on the instantaneous accumulation coefficients of algae were 1.2-2.8 times greater in the summer than in the autumn or spring at all dilutions tested. At higher concentrations (5 and 25% v/v KME) an inhibition of accumulation was usually observed during the first 5-6 d of exposure; after this period diatom biomass increased sharply. Succession of diatom taxa to different forms, rather than physiological adaptation by usually predominant species occurred. No inhibition was noted at lower concentrations (0.5, 1, and 2% v/v) of KME. Relatively high levels (20-30 microg/l) of soluble reactive phosphorus (SRP) and low concentrations of nitrate + nitrite-nitrogen (5-10 microg/l) and ammonia-nitrogen (2-20 microg/l) in the river dilution water suggested that nitrogen was the primary limiting nutrient. Ammonium uptake tests for nitrogen deficiency confirmed nitrogen limitation in algae grown in unenriched river water compared to algae exposed to KME for 6 d. Differences in chlorophyll a: ATP ratios among periphyton communities of the different treatments were minimal after 9 d. (Deal-EIS)

ZOOPLANKTON AS AN INDICATOR OF POLLUTION OF RESERVOIRS,
Tagliatti Hydrometeorological Observatory (USSR).
N. A. Dzyuban, and S. P. Kuznetsova.
Hydrobiological Journal, Vol 14, No 6, p 35-39, 1978. 1 Fig, 21 Ref.

Descriptors: *Bioindicators, *Zooplankton, *Water quality, *Reservoirs, Trophic level, Monitoring, Dominant organisms, Mathematical models, Statistical analysis, Biological communities, Water pollution effects, *Species diversity, *Diversity indices.

This article describes the first data on biomonitoring by the network of the USSR Hydrometeorological Service, and new patterns of response of zooplankters to pollution under reservoir conditions are defined. Zooplankters are a fairly representative indicator of the saprobic state of reservoir water quality. Polluted zones are determined on the basis of saprobic indices, species distribution in the zooplankton, and variations of zooplankter abundance, which tend to reflect sensitivity to pollution. The substitution, in the Pantle-Buck equation, of the quantity h (which expreses the nominal abundance of a species) by the quantity n (its actual abundance in the sample) eliminates the subjectivity of the nominal estimate. EFFECTS OF AMMONIA AND AMMONIUM ON TOLERANCE AND BYSSOGENESIS IN PERNA VIRIDIS,
Fisheries Coll., Mangalore (India).
N. A. Reddy, and N. R. Menon.
Marine Ecology-Progress Series, Vol 1, p 315-321, 1979. 7 Fig, 7 Tab, 11 Ref.

Descriptors: *Toxicity, *Mussels, *Ammonia, Ammonium compounds, Lethal limit, Mortality, Bioassay, Animal pathology, Animal physiology, Growth rates, Nitrogen compounds, Water chemistry, Hydrogen ion concentration, *Perna.

Individuals of the commercially important green mussel Perna viridis were exposed to different concentrations of ammonia (NH3) and ammonium (NH+4), to determine their reactions with reference to tolerance and byssogenesis. Eight concentrations of ammonia, ranging from 2.75 to 33.00 mg/l, and 7 concentrations of ammonium, ranging from 5.00 to 75.00 mg/l, were tested. Young individuals in the size range 20 to 24 mm shell length, collected from an unpolluted rocky shore, were used as test organisms. The 96-h lethal concentration causing 50% mortality (LC 50) was 7.60 mg/l for NH3 and 13.00 mg/l for NH+4. For ammonia, the difference between LC 50 values at 48 and at 96 h is drastic. In sublethal concentrations P. viridis retarded or suspended pedal-gland activity. A sharp reduction in the number of threads produced occurs at 5.50 and 8.25 mg/l of ammonia. At higher concentrations the byssus threads secreted displayed reduced rates of tanning and hardening. The difference in the number of byssus threads produced at various ammonia concentration was highly significant. Compared to controls the discs developed at the tips of the byssus threads did not possess normal adhesive properties. (Deal-EIS)

V. A. Alekseyev.
Hydrobiological Journal, Vol 14, No 6, p 83-89, 1978. 3 Fig, 1 Tab, 19 Ref.

Descriptors: *Phenols, *Toxicity, *Aquatic insects, *Diptera, Bioassay, Growth stages, Reproduction, Larval growth stages, Animal growth, Mode of action, Water chemistry, Mortality, Animal physiology, *Arachnida.

The effect of phenol on reproduction and development of water insects and Arachnida is traced. Resistance was studied in 23 species at different stages of metamorphosis. Small concentrations of phenol to stimulate reproduction and development (the order of oviposition is more distinct, larvae and imago hatching is more complete even as compared with the control, periods of metamorphosis are shortened): in more toxic solutions oviposition is irregular, periods of oviposition and larvae and imago hatching become longer. When concentrations are high, the loss of eggs and subsequent stages increases. Resistance at different stages of ontogenesis is shown to be determined by morphology, behavior and ecology. (Deal-EIS)

ZOOPLANKTON ECOLOGY AND POLLUTION STUDIES,
Polytechnic of the South Bank, London (England). Dept. of Applied Biology.
M. P. Tevlin, and M. J. Burgis.
In: Biological Aspects of Freshwater Pollution, O. Ravera, Ed., Pergamon Press, p 19-38, 1978. 8 Fig, 108 Ref.

Descriptors: *Zooplankton, *Bioindicators, *Daphnia, Food webs, Crustaceans, Water quality standards, Water chemistry, Bioassay, Toxicity, Methodology, Monitoring, Growth rates, Animal physiology, Cadmium.

Zooplankton organisms occupy a central position in the food webs of aquatic ecosystems. This, plus their sensitivity to environmental factors, both natural and artificial, makes the Cladocera, particularly species of Daphnia, of considerable significance to pollution studies. They are especially useful in the detection of low levels of toxins and this is illustrated by a brief outline of the historical development of pollution studies using biological indicators. Since the effects of pollutants on these organisms can only be assessed when the effects of natural environmental variation are taken into account, the complexities of natural population responses to environmental factors are reviewed. Pollution effects are discussed with reference to studies involving natural communities and laboratory assay procedures. (Deal-EIS)

Descriptors: *Isopods, *Powerplants, *Toxicity, *Aquatic populations, Water temperature, Life history studies, Invertebrates, Biomass, Heated water, Thermal pollution, Seasonal, Growth stages, River Trent, Water pollution effects.

Five populations of Asellus aquaticus, subjected to different combinations of temperature and organic pollution in the River Trent, were examined over a period of 18 months. The life-cycle was probably completed in a year or less in all the populations sampled, a larger proportion of the animals completing the life-cycle in less than a year at warmer locations. Young animals also hatched 1 or 2 months earlier at the warmer locations. At the locations subjected to most organic pollution, population densities and the size of animals of both sexes were the largest. The size of ovigerous females, however, appeared to be inversely related to temperature, the smallest occurring at the warmest location. Possible explanations for these differences are given in terms of the amount of food available and the effect of temperature on growth and sexual maturation. (Deal-EIS)

RADIOACTIVE CONTAMINATION OF THE AQUATIC FOOD-CHAIN AND CONSEQUENT RISK TO MAN,
Comitato Nazionale per l'Energia Nucleare, Rome (Italy). Div. Protezione Ambiente.
A. A. Cigna.
In: Biological Aspects of Freshwater Pollution, O. Ravera, Ed., Pergamon Press, p 163-177, 1978. 2 Ref.

Descriptors: *Food chains, *Public health, *Radioisotopes, Radiation, Radioactivity effects, Radioecology, Radiosensitivity, Radiochemical analysis, Chemical properties, Sedimentation, Path of pollutants, Water quality standards, Radioactive wastes.

The extreme caution adopted to keep any radioactive contamination within safe and severe limits implies that any component of the environment is protected from possible harmful effects, considering that man is among the organisms most sensitive to radiation. The general criteria of radiation protection lead to the fixation of the quantity of radioactive substances which can be discharged into an environment. This quantity is usually expressed in a so called 'discharge formula'. Many difficult problems are involved in the determination of such a formula: characteristics of environmental media, various phenomena which may modify the distribution of radioactivity and all factors which influence the exposure of man to radiation. All these factors must be evaluated against the general re-

quirement of public health and of economical feasibility. Only a fraction of the limiting environmental capacities will eventually be utilized for the effective discharge of radioactive wastes into the environment. Within this fraction the contribution of each radionuclide species is defined relative to the contribution of all other species. (Deal-EIS)

THE EFFECTS OF ACCLIMATION ON THE SALINITY TOLERANCE OF GRASS CARP, CTENOPHARYNGODON IDELLA (CUV. AND VAL.),
Arkansas Univ., Fayetteville. Dept. of Zoology.
R. V. Kilambi, and A. Zdinak.
Journal of Fish Biology, Vol 16, p 171-175, 1980. 3 Tab, 9 Ref.

Descriptors: *Salt tolerance, *Carp, *Adaptation, Grass carp, Salinity, Water chemistry, Fish physiology, Animal metabolism, Toxicity, Mortality, Freshwater fish, Lethal limit, Weight, Ctenopharyngodon, *Acclimation, Salinity tolerance.

Grass carp acclimated to 3, 5, 7, and 9 o/oo salinities were tested for salinity tolerance. The upper tolerance limit (LS50) for 3 and 5 o/oo, and 7 o/oo acclimated fish were 14.2 and 14.0 o/oo, respectively. Fish acclimated to 9 o/oo had a 50% mortality at an estimated salinity of 16.0%, for 24h exposure. Weight losses for the 3 and 5 o/oo acclimated fish were significantly lower than for those acclimated to 9 o/oo. (Deal-EIS)

KEPONE EFFECTS ON LARVAL DEVELOPMENT OF MUD-CRAB AND BLUE-CRAB,
Duke Univ., Durham, NC. Dept. of Zoology.
C. G. Bookhout, J. D. Costlow, Jr., and R. Monroe.
Water, Air, and Soil Pollution, Vol 13, p 57-77, 1980. 7 Fig, 6 Tab, 27 Ref.

Descriptors: *Pesticide toxicity, *Larval growth stage, *Crabs, Mortality, Lethal limit, Bioassay, Growth stages, Chlorinated hydrocarbon pesticides, Growth rates, Crustaceans, *Kepone.

Laboratory experiments were conducted to determine the effects of Kepone on the larval development of the mud-crab, Rhithropanopeus harrisii, and the commercial blue crab, Callinectes sapidus, from the time of hatching until the first crab stage was reached. Differential survival of R. harrisii from hatching to first crab stage occurred in a range of 35 to 125 ppb Kepone, whereas differential survival of C. sapidus over the same period of development occurred in a range of 0.1 to 1.0 ppb. Statistical analysis indicated that, for every 10 ppb Kepone added, duration from hatching to first crab stage of R. harrisii was increased by 0.391 + or - 0.043 days; whereas for each increase of 0.1 ppb, the duration from hatching to first crab stage of C. sapidus is prolonged by 0.38 + or - 0.10 days. The first and second zoeal stages of R. harrisii were the most sensitive developmental stages to Kepone, but the first zoeal stage of C. sapidus was not sensitive, statistically, to any concentration of Kepone tested. In zoeal stages II, III and IV, there were significant increases in mortality of C. sapidus over the previous stage in all media tested. (Deal-EIS)

THE USE OF ISAZA (CHAENOGOBIUS ISAZA TANAKA) TO STUDY THE PCB POLLUTION (IN JAPANESE),
Kobe Shoka Daigaku (Japan).
N. Watanabe, Y. Ishimaru, N. Ishida, Y. Katayama, and S. Kitayama.
The Japanese Journal of Limnology, Vol 40, No 2, p 66-73, 1979. 6 Fig, 1 Tab, 16 Ref. (English abstract).

Descriptors: *Polychlorinated biphenyls, *Pesticide residues, *Chemical wastes, Industrial wastes, Chemical analysis, Gas chromatography, Animal metabolism, Lakes, Lipids, Pesticide kinetics, Lake Biwa, Japan, Chaenogobins, *Japan, *Tissue analysis.

Polychlorinated biphenyls (PCBs) have been used in industry since 1954. Around Lake Biwa, 16 factories used such materials, and they were detected in many environmental samples from the lake. In this study, the PCB concentration was determined by gas-chromatography in Isaza, in the northern part of Lake Biwa. PCB residues were found in all the samples collected from 1966 to 1976, and the concentrations ranged from 0.413 to 1.53 ppm. PCB residues in Isaza aged 1 are higher than those in Isaza aged 0, and the differences is significant. This difference is thought to be related to the difference of their fat contents. The ratio of highly chlorinated PCB to the total PCB residue in Isaza aged 1 is significantly higher than that in Isaza aged 0. The reason seems to be that low chlorinated PCBs are more easily metabolized than highly chlorinated PCBs. PCB residues in Isaza do not show much decrease even after PCB production was stopped in 1972. (Deal-EIS)

RESPONSES OF SALT MARSH VEGETATION TO OIL SPILLS AND REFINERY EFFLUENTS,
Field Studies Council, Pembroke (Wales). Oil Pollution Research Unit.
J. M. Baker.
In: Ecological Processes in Coastal Environments, R. L. Jefferies and A. J. Davy, Eds., Blackwell Scientific Publications, Oxford, p 529-542, 1977. 3 Fig, 2 Tab, 33 Ref.

Descriptors: *Oil spills, *Toxicity, *Salt marshes, *Aquatic plants, Oil, Oil pollution, Plant physiology, Mode of action, Plant pathology, Plant populations, Dominant organisms, Plant growth, Salt marsh plants, *Crude oil.

Salt marsh plants show a wide range of susceptibility to typical crude oils, ranging from annuals such as Salicornia spp. which are killed by one oiling, to Oenanthe lachenalii which withstands 12 successive monthly applications of fresh Kuwait crude oil. Spartina anglica survives most single oil spillages well but does not tolerate chronic pollution. Experimental evidence suggests that oil inteferes with the normal oxygen diffusion process down the plants into the roots. Competitive advantages are gained by tolerant species following oiling. This is particularly striking in the upper salt marsh community studied, where the susceptible Juncus maritimus was replaced by Oenanthe and by Agrostis stolonifera. Marsh cleaning methods (burning, cutting or treatment with chemical dispersants) do not appear to decrease the damage done by oil pollution, and often increase it. Different crude oils and products vary considerably in their toxicity. Light aromatics appear to be the greatest contributor to acute toxicity. Some heavy or weathered oils stimulate the growth of salt marsh plants. (Deal-EIS)

5D. Waste Treatment Processes

PHOSPHATE REMOVAL FROM INDUSTRIAL AND MUNICIPAL WASTEWATER,
Rutgers - The State Univ., New Brunswick, NJ. Water Resources Research Inst.
R. C. Ahlert, M. L. Granstrom, and M. A. Slam.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-173958, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Institute, Rutgers University, Final Technical Completion Report, April 1980. 7 p. OWRT-A-052-NJ(1), 14-34-0001-9032.

Descriptors: *Phosphorus, Phosphates, Treatment, Waste water treatment, Industrial wastes, Municipal wastes, Evaluation, Methodology, Chemical precipitation, Nutrients, Sewage treatment, Phosphorus removal.

Phosphorus removal was evaluated at several points in a conventional wastewater treatment process. Samples were taken from a secondary plant utilizing a high rate trickling filter on municipal wastewater. Treatment of settled primary effluent, secondary effluent and settled secondary effluent was considered. The experimental matrix included ferric ion dosage and pH level. Sampling points were selected to highlight process variables of interest. These included organic carbon content and unsettled solids content. In all cases, phosphorus removal was substantially less than predicted from pure species solubility data. In addition, the effect of unsettled or unsettleable solids is marked. In all experiments, comparisons of removal efficiency were made for filtered and unfiltered portions of process samples. Beyond the obvious effects of cation dosage and pH, the nature and concentration of particulate matter appear to be important treatment variables.

WATER INTAKE, WASTEWATER PRODUCTION AND TREATMENT, AND AIR POLLUTION CONTROL IN COAL-FIRED STEAM-ELECTRIC POWER GENERATING STATIONS.
CH2M/Hill Ltd., Ottawa (Ontario).
Water Pollution Control Directorate, Ottawa, Ontario, Canada, Environmental Protection Service. Report No EPS 3-WP-80-1, 1980. 145 p, 32 Fig, 33 Tab, 29 Ref.

Descriptors: *Baseline studies, *Emission standards, *Air pollution, *Water pollution, Particulate removal, Flue gas desulphurization, Solid waste disposal, Water management, Costs, Waste disposal, Power plants, Electricity.

Basic air and water emission requirements, and power plant design and operating characteristics are defined. Air pollution control particulate removal devices and a variety of flue gas desulphurization (FGD) alternatives are compared in terms of economic and technical applicability, water requirements, water consumption, and liquid and solid wastes production during power station operation with different types of coal. Three possible station water management systems (once-through, recirculation with limited discharge, and zero discharge) are evaluated under selected conditions, and their impacts on water intake, consumption and wastewater treatment are compared in detail. Coal type is shown to have a strong influence on the quantities of wastes produced and type of air pollution control devices which may be used. In turn, the types of control devices selected are also shown to affect the nature of subsequent wastewater and solid wastes problems. Wastewater recirculation and re-use designs incorporated into station water use related to air pollution controls are found useful in reducing water consumption and wastewater production and treatment requirements. EVALUATION OF INDUSTRIAL WASTE CARBON SOURCES FOR BIOLOGICAL DENITRIFICATION,
Environmental Protection Service, Ottawa (Ontario). Water Technology Centre.
H. D. Monteith, T. R. Bridle, and P. M. Sutton.
Report No EPS 4-WP-79-9, 1979. 71 p, 8 Fig, 8 Tab, 16 Ref, 3 App.

Descriptors: *Biological denitrification, *Industrial wastes, Substrate consumption, Waste characterization, Oxygen demand, Organic carbon, Nitrogen, Methanol.

Concern over impairment of water quality by both industrial and municipal effluents has resulted in extensive investigations into nitrogen removal processes. Biological dentrification is one of the most economical and effective means of nitrate reduction. The process involves the conversion of nitrate to dinitrogen (N2) using organic carbon as the electron donor. Methanol appears to be the most popular electron donor. Although methanol has certain advantages, its significant disadvantage is cost and this alone justifies consideration of alternative electron donors. A project was initiated to identify and evaluate industrial wastes or waste by-products which could be used as replacements for methanol. Forty-one waste samples were collected and chemically analyzed to determine their organic carbon and nitrogen concentrations. Bench scale testing followed, with the determination of batch denitrification rates for 30 of the characterized wastewaters. Twenty-seven of the 30 wastes exhibited denitrification rates equal to or greater than that observed using methanol. Many of the wastes exhibited substrate consumption ratios equal to or less than that for methanol. Data analysis showed a correlation between the initial FOC:N ratio and substrate consumption ratio. Evaluation of costs for transportation of waste carbon sources by truck are compared to methanol disposal. (WATDOC)

BIODEGRADATION OF THIOCYANATE BY MICROORGANISMS ISOLATED FROM GAS LIQUOR,
North Dakota State Univ., Fargo. Dept. of Biochemistry.
J. A. Fleeker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-175029, Price codes: A03 in paper copy, A01 in microfiche. North Dakota Water Resources Research Institute, North Dakota State University, Research Project Technical Termination Report, November 1978. p 26, 6 Fig, 2 Tab, 24 Ref. OWRT A-054-NDAK(1).

Descriptors: *Biodegradation, *Bacteria, *Microbial degradation, *Waste water treatment, Coals, Soil microbiology, Cultures, Microorganisms, Soil bacteria, Tracers, Spectrophotometry, Chromatography, Analytical techniques, Arthrobacter, Thiocyanate.

Enrichment culture techniques were used to isolate an Arthrobacter species capable of using thiocyanate as a nitrogen source. Thiocyanate, a pollution indicator, is found in waste waters from coal gasification and coke production. Two enrichment media were used, a carboxylic acid-mineral medium (CM) and a glucose-mineral medium (GM); both were successful in producing isolates. The colony studied was isolated from a soil sample taken adjacent to a railroad bank and was isolated with the GM enrichment medium. The Arthrobacter isolated is gram-positive, heterotrophic, polymorphic, and grows in salmon-colored, opaque colonies. It is able to grow on alcohols, amines, carbohydrates, and acids. The Arthrobacter can degrade thiocyanate even in the presence of ammonium or nitrate ions. It tolerates thiocyanate in concentrations up to 0.1M. Analytical methods used include spectrophotometry, paper chromatography, quanine-cytosine content analysis, and radioisotopic analysis. Radioactive thiocyanate and the release of radioactive C02 were used to monitor decomposition rates. Results show that thiocyanate degradation falls to low levels as growth approaches the stationary phase. Unsuccessful attempts were made to produce a cell-free extract of the Arthrobacter that could chemically change thiocyanate. (Seigler-IPA)

IRRIGATION RETURN FLOW TREATMENT BY BIOLOGICAL DENITRIFICATION PROCESS FOR NITRATE REMOVAL,
North Dakota Univ., Grand Forks. Dept. of Civil Engineering.
Y. T. Hung, and G. O. Fossum.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-175318, Price codes: A06 in paper copy, A01 in microfiche. North Dakota Water Resources Research Institute, North Dakota State University, Fargo Research Project Technical Completion Report, September 1979. p 102, 18 Fig, 41 Tab, 10 Ref. OWRT A-058-NDAK(1).

Descriptors: *Denitrification, *Anaerobic bacteria, *Biological treatment, *Water purification, *Irrigation water, Nitrates, Nutrient removal, Potable water, Reclaimed water, Water quality, Biodegradation, Waste water treatment, Eutrophication.

Anaerobic upflow continuous biological filters were used to remove excessive nitrate-nitrogen (N03-N) from irrigation return flows which typically contain high concentrations of N03-N. A maximum N03-N level of 10 mg/l in drinking water is specified by national regulations. For the study synthetic irrigation return flow was used composed of water from the Water Treatment Plant at Grand Forks, North Dakota, supplemented with various concentrations of sodium nitrate and methanol. Anaerobic bacteria from settled sludge from the Water Treatment Plant were acclimated in a batch reactor for two months. For the filters, three columns were constructed of clear lexan polycarbonate to a height of 6 ft with a 3 in inside diameter. Feed concentrations were varied from 5 to 100 mg/l N03-N and methanol to N03-N ratios ranged from 0.5 to 3.0. Various hydraulic loading rates tested ranged from 132 to 1,222 gpd/sq ft. Results show that the filters are a feasible method of denitrification of irrigation return flow. For a feed of 40 mg/l or less of N03-N, a 2 ft column produced acceptable water with 10 mg/l or less N03-N. Results are given for other combinations of feed concentration, methanol concentration, and loading rates. The deterioration of nitrate samples were also investigated with respect to storage time and chemical preservation of feed water. (Seigler-IPA)

THE EFFECT OF SEWAGE EFFLUENT ON THE STRUCTURE AND FUNCTION OF A FRESHWATER TIDAL MARSH ECOSYSTEM,
Rider Coll., Trenton, NJ. Dept. of Biology.
D. F. Whigham, R. L. Simpson, and K. Lee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-176100, Price codes: A08 in paper copy, A01 in microfiche. New Jersey Water Resources Research Institute, Rutgers University, New Brunswick. Final Technical Completion Report, February, 1980. 160 p, 23 Fig, 82 Tab, 56 Ref. OWRT B-060-NJ(4), 14-34-0001-6099.

Descriptors: *Nutrient removal, *Sewage treatment, *Tidal marshes, *Freshwater marshes, *Marsh plants, Soil algae, Litter, Decomposing organic matter, Primary productivity, Chlorophyll, Dissolved oxygen, Carbon dioxide, Nitrogen, Phosphorus, Soil, Water pollution control, Waste assimilative capacity, Biomass, Chlorophyta, Chrysophyta, Euglenophyta, Cyanophyta, Nitrates, Nitrites, Ammonia, Delaware River, *Hamilton marshes(NJ), New Jersey.

The effects of spraying chlorinated secondarily treated sewage on a Delaware River freshwater tidal wetland for three years was studied. Macrophyte net primary production was significantly lower in the experimental sites receiving sewage than in the no treatment controls in 1975 but not in 1976 or 1977. Diversity of annuals was reduced in the experimental sites largely due to the elimination of annuals. Although percent N and P were generally high in the vegetation of experimental sites, there was little difference in Total N and Total P between treatments and controls. Macrophyte decomposition rates were little affected by sewage application. Substrate N and P were not significantly different between sites, but surface litter of the experimental sites accumulated N and P. Epibenthic algae may contribute to this accumulation. Water quality studies showed the high marsh to be metabolically active. Tide cycle flux studies indicated that up to 40% of the N added to the wetland was assimilated during the late spring - early summer period. Conversely, there was a net loss of P from the wetland. These results are compared with those of similar studies in other wetlands. It is concluded that the strongly pulsed tidal regimes of the wetland, the low organic content substrate, and the eutrophic nature of Delaware River waters contribute to the inability of the wetland to efficiently assimilate nutrients from sewage.

INTERCEPTOR SEWERS AND URBAN SPRAWL,
Urban Systems Research and Engineering, Inc., Cambridge, MA.
C. Binkley, B. Collins, L. Kanter, M. Alford, and M. Shapiro.
Lexington Books, Lexington, MA. 1975. 120 p.

Descriptors: *Water quality, *Sewage systems, *Interceptor sewers, *Conveyance structures, *Sewers, *Urban land use, *Urban impact, *Urbanization, Water quality management(Applied), Sewage, Urban drainage, Social aspects, Project design, Environmental effects, Public participation, Cost-benefit analysis, Mathematical studies, Costs, Capacity, Flow rates.

This book is based on a study which was undertaken to analyze the relationship of urban growth and the federal sewer grant program. Recent interceptor projects financed by U.S. Environmental Protection Agency grants are examined to determine how they affect residential development in the areas where they are built. Alternative methods of interceptor financing with important land use implications include withholding of funds unless certain land use objectives are met, changing the grant formula, and limiting or curtailing funding of reserve capacity. Eight case studies were undertaken to determine which of the policies would work best under varying conditions; summaries are presented for four. Interceptor design and its relation to land use are discussed. An overview of the size and scope of projects in the study sample is presented. Factors influencing interceptor costs are discussed and data obtained in the study are analyzed. Excess capacity built into the interceptors sampled averaged $145 per capita, with costs as high as $658 per capita occurring. Interceptor staging policies are analyzed to pinpoint no Federal funds for excess capacity; reevaluation of interceptor staging of project design in rapidly growing areas; using realistic standards for per capita flow; improving population forecasting techniques and review procedures; requiring consideration of environmental effects of interceptor-induced land use; and increasing public participation in the planning process by publicizing community costs and benefits of interceptor-induced growth. 5E. Ultimate Disposal Of Wastes

BOREHOLE GEOPHYSICS AS APPLIED TO THE MANAGEMENT OF RADIOACTIVE WASTE -- SITE SELECTION AND MONITORING,
Geological Survey, Denver, CO. Water Resources Div.
W. S. Keys, D. E. Eggers, and T. A. Taylor.
In: Management of Low-Level Radioactive Waste, Carter, M.W., and others, eds: New York Pergamon Press, Inc., Elmsford, p 955-982, 1979. 7 Fig, 3 Tab, 25 Ref.

Descriptors: *Borehole geophysics, *Radioactive wastes, *Waste disposal wells, *Injection wells, Sites, Monitoring, Borehole cameras, Radioactive well logging, Subsurface investigations.

The U.S. Geological Survey is conducting research on borehole geophysics, including the application of well logging to the investigation of radioactive waste disposal sites. During the past 14 years, eight such sites have been studied. Geophysical well logging provides in situ measuring techniques which can be used to supplement conventional coring and water sampling techniques in both site-selection studies and in the monitoring of operating disposal sites. Some of the advantages of well logging over conventional techniques include the relatively large volume of rock that can be investigated and the ability to measure temporal changes. Logging also reduces the amount of expensive coring required. Logs provide a continuous record of data that can be correlated from hole to hole. Data from geophysical logs can be interpreted in terms of lithology, elastic moduli, bulk density, porosity, moisture content, water quality, and the location and orientation of fractures. Fracture permeability can provide avenues for rapid water movement. After a site is in use, borehole geophysics provides a means to monitor changes in moisture content, water level, and radionuclide concentration in either cased or open holes. Water samples usually provide data only on the permeable intervals below the water table. Gamma spectral logging techniques provide data for any point in the well in relation to vertical and lateral distribution of contaminants. Radionuclides that have migrated from several operating sites have been identified. Detection limits on the order of 0.2 picocuries per gram have been attained for 60Co and 137Cs. A number of other gamma-emitting radioisotopes can be identified using inhole gamma spectrometry. (Kosco-USGS)

National Water Well Association, Worthington, OH.
T. C. Gass.
Water Well Journal, Vol 34, No 2, p 38-39, February, 1980. 2 Fig.

Descriptors: *Ground water, *Water pollution control, *Waste disposal, Hazards, Attenuation, Absorption, Waste dilution, Dispersion, Path of pollutants, Persistence, Regulations, Law enforcement, Legislation.

Ground water contamination by hazardous wastes can occur through poorly-designed landfills, industrial liquid waste impoundments, and underground contaminant facilities. Contaminants in ground water tend to be removed or reduced with time and distance by adsorption, dilution and dispersion. Contaminants form a plume, the shape and size of which depend upon local geology, ground water flow, type and concentration of contaminants, continuity of waste disposal and any man-made changes such as well pumping. Ground water contamination may persist for years if a contaminant is not readily absorbed or degraded. Local, state and federal governments help protect ground water resources by promulgating and enforcing hazardous waste disposal regulations. The Safe Drinking Water Act, Resource Conservation and Recovery Act, and Toxic Substances Control Act are examples of federal legislation which have provisions for ground water protection. STANLY COUNTY FEASIBILITY REPORT FOR ON-SITE WASTEWATER SYSTEMS MANAGEMENT: PHASE I,
Stanly County Health Dept., Albemarle, NC.
B. R. Gray, S. C. Grayson, J. P. Straley, B. L. Kays, and B. L. Carlile.
(1979). 108 p, 11 Fig, 15 Tab, 5 Append. P004198013.

Descriptors: *Waste water treatment, *Water quality, *Surface waters, *Subsurface waters, *Stanly County(NC), *Water management(Applied), Waste water(Drainage), Water treatment, Waste water disposal, Septic tanks, Administrative costs, Maintenance costs.

The authors discuss a three month study of the feasibility of Stanly County, NC, providing management of its own on-site wastewater disposal system in practical, legal, technical, political and financial terms. A county managed system was determined necessary to protect adequately the area's surface and subsurface water quality. The investigation included aerial infrared photography surveillance, in which approximately 2,000 homes were surveyed for surfacing sewage effluents, with problems detected around 40% of the dwellings, and system failures discovered in 12%. The county

has inherent problems in the design of ground absorption sewage disposal systems due to its soil types. Hydraulic conductivity studies were undertaken at selected sites based on type of subsoil and the amount of that soil across the county. Guidelines are presented for alternative pressure systems and for tanks, pumps, controls, and drainfields for low pressure home sewerage systems. An economic analysis was undertaken to determine financial feasibility. Various elements of the cost included an initial sinking (or contingency) fund, regular maintenance costs and administrative costs, and financing of system improvement to cover costs of renovation. The number of customers would have a major influence on monthly costs to individual customers. Areas for study in Phase II of the project include education of local officials and the public in water quality management needs, finding further methods of financing the overall program, and effecting amendments in the Federal 201 facilities plan so that more dollars will be available for water quality management. 6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

OPTIMIZING FLOOD OPERATION RULES,
Texas Univ. at Austin. Center for Research in Water Resources.
L. R. Beard, and S. Chang.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-176639, Price codes: A04 in paper copy, A01 in microfiche. Technical Report No CRWR-166, November 1979. 48 p, 9 Tab, 20 Ref, 1 Append. OWRT B-182-TEX(1).

Descriptors: *Flood control, *Reservoir operation, *Optimization, *Dynamic programming, Computer programs, Computer models, Mathematical models, Flood damage, Peak discharge, Stochastic processes, Reservoir releases, Flood protection, Mississippi, Inflow, Reservoir stages.

Stochastic dynamic programming was used to formulate flood-control reservoir operation rules with provisions for traditional considerations, flood-warning time, and damage increase due to flooding duration. Since future inflows into a given reservoir are not known, all floods of record that followed each classification of system state were taken as representative of all floods to follow that class of system state. The three dimensions of system state are initial reservoir storage, current inflow, and rate of change of inflow. A discussion of dynamic programming formulation for the least-expected-damage reservoir release policy is given along with the traditional release rule. These are coded in the program UTFCO-University of Texas Flood Control Operations. Input preparations and program source listings are provided. The program is illustrated using records for the Pearl River at Jackson, Mississippi, for 1914-1969. Operational rules were developed for a hypothetical reservoir having a flood control capacity of 150,000 acre-feet. The example used is based on daily in flows but the model also applies to complete records of average streamflows for shorter intervals. Program computational costs are about 10 to 40 times the costs of traditional approaches depending on the number of storage levels used. Storage required to compile on a CDC Cyber 170/175 is 62,000 octal and to run 131,000. (Seigler-IPA)

PROBABLE HYDROLOGIC EFFECTS OF A HYPOTHETICAL FAILURE OF MACKAY DAM ON THE BIG LOST RIVER VALLEY FROM MACKAY, IDAHO, TO THE IDAHO NATIONAL ENGINEERING LABORATORY,
Geological Survey, NSTL Station, MS. Water Resources Div.
L. Druffel, G. J. Stiltner, and T. N. Keefer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-301175, Price code: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-99, September 1979. 47 p, 20 Fig, 6 Tab, 15 Ref.

Descriptors: *Probability, *Hydrologic budget, *Dam failure, *Model studies, *Idaho, Reservoirs, Analytical techniques, Mathematical models, Flood wave, Discharge(Water), Floodflow, Flood routing, Simulation analysis, Streamflow, Flow rates, Big Lost River Valley(Idaho), Mackay Dam(Idaho).

Mackay Dam is an irrigation reservoir on the Big Lost River, Idaho, approximately 7.2 kilometers northwest of Mackay, Idaho. Consequences of possible rupture of the dam have long concerned the residents of the river valley. The presence of reactors and of a management complex for nuclear wastes on the reservation of the Idaho National Engineering Laboratory (INEL), near the river, give additional cause for concern over the consequences of a rupture of Mackay Dam. The objective of this report is to calculate and route the flood wave resulting from the hypothetical failure of Mackay Dam downstream to the INEL. Both a full and a 50 percent partial breach of this dam are investigated. Two techniques are used to develop the dam-break model. The method of characteristics is used to propagate the shock wave after the dam fails. The linear implicit finite-difference solution is used to route the flood wave after the shock wave has dissipated. The time of travel of the flood wave, duration of flooding, and magnitude of the flood are determined for eight selected sites from Mackay Dam, Idaho, through the INEL diversion. At 4.2 kilometers above the INEL diversion, peak discharges of 1,550.2 and 1,275 cubic meters per second and peak flood elevations of 1,550.3 and 1,550.2 meters were calculated for the full and partial breach, respectively. Flood discharges and flood peaks were not compared for the area downstream of the diversion because of the lack of detailed flood plain geometry. (Kosco-USGS)

REGIONAL DROUGHT AND FLOOD FREQUENCY ANALYSIS: THEORETICAL CONSIDERATION,
Technical Univ. of Istanbul (Turkey). Dept. of Hydraulic and Water Power.
Z. Sen.
Journal of Hydrology, Vol 46, No 3/4, p 265-279, April 1980. 1 Fig, 22 Ref.

Descriptors: *Droughts, *Flood frequency, *Theoretical analysis, Hydrology, Hydrologic data, Floods, Water shortage, Properties, Disasters, Probability, Stochastic processes, *Regional drought, *Flood frequency analysis, Hydrologic phenomena, Normal distribution, Extreme value statistics, Random variables, Water resources systems analysis.

The problems of regional drought and flood analysis were approached theoretically on the basis of random fields. Necessary formulations for the regional drought descriptors such as the deficit area, the total areal deficit, and the maximum deficit intensity were derived. The joint and marginal probability distribution functions of areal drought/flood descriptors were derived for simple cases on the basis of random fields and probability theory. The relationships between expectations of descriptors were explicity furnished which are useful tools in any regional drought and flood assessment. The extreme event probabilities of the whole area covered by a drought were obtained. (Roberts-ISWS)

LEVEL-B MULTIOBJECTIVE PLANNING FOR WATER AND LAND,
Case Western Reserve Univ., Cleveland, OH. Dept. of Systems Engineering.
Y. Y. Haimes, P. Das, and K. Sung.
Journal of the Water Resources Planning and Management Division, Vol 105, No WR2, p 385-401, September 1979. 2 Fig, 2 Tab, 41 Equ, 18 Ref. OWRT C-7047 (No 6221)(7).

Descriptors: *Multiple-purpose projects, *Land use, *Planning, *Water resources, *Maumee River basin(Indiana), *Water pollution, *Model studies, Decision making, Optimization, Cost minimization, Constraints, Environmental quality, Economics, Surrogate Worth Trade-Off Method, Pollution abatement, Point source pollution, Non-point source pollution, Recreation, Waste water treatment, Wild-life habitats, Equations, Systems analysis.

Presented are multiobjective optimization models representing economic development and environmental quality relating to water quality and land use planning. Linear programming is used to derive least-cost point and nonpoint source pollution abatement alternatives, including other related land activities. The environmental quality sector includes the following noncommensurable objectives: (1) soil erosion and sediment control; (2) control of phosphorus discharge from point and nonpoint sources; (3) abatement of biological oxygen-demanding material from point sources; (4) enhancement of land-based recreational opportunities; (5) maintenance of wildlife habitat; and (6) flood control. A trade-offs analysis is carried out using the Surrogate Worth Trade-Off Method. A planning framework is developed for the Maumee River Basin Level-B Study. A recommended plan with its associated trade-off values is presented, and the decision-maker's (Planning Board) role in obtaining a basin-wide plan is discussed. (Bell-Graf-Cornell)

THE GREEN RIVER BASIN ROUTING MODEL,
Purdue Univ., Lafayette, IN. School of Civil Engineering.
H. Yazicigil, A. R. Rao, and G. H. Toebes.
Hydraulics and Systems Engineering, CE-HSE-79-1, 1979. 141 p, 39 Fig, 16 Tab, 20 Ref, 3 Append. DAW 27-74-C-0012.

Descriptors: *Reservoir operation, *River forecasting, *Systems analysis, River management, Reservoir releases, Reservoir storage, *Streamflow forecasting, Model studies, Kentucky, *Green River basin(KY).

Systems analysis techniques are applied to the operation of a series of four flood control reservoirs on the Green River in Kentucky. The reservoir system is regulated by the Louisville District Corps of Engineers. In an earlier report a set of four correlative precipitation-runoff models were built for the watersheds controlled by the reservoirs. A sequel is a larger optimization-simulation model that can be used as an aid in day-to-day operations of the reservoir systems. This includes a streamflow model which can be used to forecast flows in the 'central' part of the Green River Basin; that is, the river system downstream of the outlet works of the four reservoirs. In addition to the model constructed in the study, stochastic models of daily flow series at the Green River outflow station, Calhoun, were developed. The ARMA and AR models were tested as to their performance in forecasting streamflow. Both models performed equally well with one or two day lead times, however their accuracy diminished with time. The model developed for this study GRBSYS2 performed better over time than those mentioned above. (Rao-Purdue)

MULTI-OBJECTIVE ANALYSIS IN WATER SUPPLY AND MANAGEMENT PROBLEMS FOR A SINGLE RIVER BASIN,
Kobe Univ. (Japan). Dept. of Systems Engineering.
M. Sakawa.
Water Supply and Management, Vol 3, No 1, p 55-64, 1979. 8 Ref, 3 Fig, 2 Tab.

Descriptors: *River basins, *Water supply, *Water management(Applied), *Model studies, *Multi-objective model, *Japan, *Kakogawa River Basin(Japan), *Hyogo Prefecture(Japan), Nonlinear programming, Decision making, Cost assessment, Surrogate Worth Trade-off method, Planning, River basin development, Water resources, Watershed management.

The objective of this study is to develop a multi-objective water supply and management model for a single river basin. The model which is constructed is formulated as a multi-objective nonlinear programming problem. It is assumed that the decision maker's objectives include minimizing total cost associated with construction and operation of the facilities, minimizing pollution and maximizing water supply for the basin. The Surrogate Worth Trade-off method is used to resolve the conflicts between the objectives. For the framework of planning the author assumes that dams are constructed to develop available fresh water in the headwaters of the river basin; industrial and domestic water-conveyance systems between zones are taken into consideration; and in each zone, both fresh and renovated water are utilized, where highly treated water by tertiary treatment plants can be reused for industrial usages only. The model is applied to the study area of the Kakogawa River Basin in Hyogo Prefecture. The solution procedure utilized an epsilon-constraint method using the generalized reduced gradient (GRG) algorithm. In this model in order to obtain the most preferable solution it is important for the decision maker to quantify the preference among the objectives in accordance with the situation of his concern. The author concludes that this model can be applied to other single river basins with some modifications. (Iervolino-NC)

ANALYSIS OF STRUCTURAL AND NON-STRUCTURAL FLOOD CONTROL MEASURES USING COMPUTER PROGRAM HEC-5C,
Hydrologic Engineering Center, Davis, CA.
W. K. Johnson, and D. W. Davis.
Training Document No 7, November 1975. 203 p, 26 Fig, 13 Tab, 6 Ref, 1 Append.

Descriptors: *Non-structural alternatives, *Flood control, *Flood plain management, *Analytical techniques, *Cost-benefit analysis, *Fall River(CA), *Planning, Land use, Hydrologic aspects, Stage-discharge relations, Flood discharge, Flood damage, Flood control, Water resources management, Levees, Floodwalls, Reservoirs, Channel improvement, Diversion, Flood forecasting, Floodproofing, Warning systems, Computer programs, Economics, Mathematical models.

The authors illustrate how various flood control measures can be analyzed using the HEC-5C computer program. Basic principles in flood control planning and damage reduction are examined. Flood plain management measures include those designed to control hydrology and those designed to reduce susceptibility of property to damage. Hydrologic and economic relationships are examined and the affects of different types of flood control measures are presented. Of the eight control methods, levees or floodwalls were found to affect the stream's stage-discharge, stage-damage, discharge-damage, and damage frequency relationships. Diversion and flood forecasting affected these relationships the least, but all the methods affected the damage frequency. The HEC-5C program was used to develop systems which maximize net economic benefits. Given an existing system and an array of flood control measures, the strategy proceeds by computing expected annual damages for the existing system; adding any one of the flood control measures and computing expected annual damages; then subtracting expected annual damages with or without the control measure. Finally, the best measure was chosen based upon its final net benefit yield. A final added strategy recomputed costs and benefits by removing one of the control measures to determine if a better net benefit figure would be yielded. The Fall River System of California was used to illustrate how the program functions. (Arnold-NC)

6B. Evaluation Process

MEASURING THE SOCIAL IMPACTS OF WATER RESOURCES PROJECTS,
Kansas Water Resources Research Inst., Manhattan.
C. B. Flynn.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-173545, Price codes: A03 in paper copy, A01 in microfiche. Project Completion Report, April 1980. p 21, 7 Fig, 2 Tab. OWRT A-084-KAN(1), 14-34-0001-7035.

Descriptors: *Kansas, *Hillsdale Dam(Kan), *Mud Creek(Kan), Water resources projects, *Social impact, *Construction, *Hydraulic structures, Evaluation, Dependent variables, Independent variables, Quantitative variables, Qualitative variables.

Two water resources projects, the Hillsdale Dam Construction and the Mud Creek Rechannelization, were examined in order to determine whether projects of different sizes produce social impacts of different sizes. The study (1) identified a wide range of social impacts (dependent variables) and those of elements of the projects which affect the magnitude of the impacts (independent variables); (2) defined appropriate geographical impact areas within which changes in the independent variables could be expected to effect changes in the dependent variables; (3) operationalized the variables so that measurements could be obtained for the impact areas; (4) measured the variables for projects in the planning stages; and (5) monitored the variables over time, that is, during and after the construction of the projects. The results indicated that although the quantitative variables monitored did not vary by size of project, the qualitative variables did.

RIVER AMENITY EVALUATION: A REVIEW AND COMMENTARY,
North Central Forest Experiment Station, St. Paul, MN.
E. C. Leatherberry.
Water Resources Bulletin, Vol 15, No 5, p 1281-1292, October 1979. 21 Ref.

Descriptors: *Rivers, *Recreation, *Evaluation, *River resource assessment, *River esthetic assessment, *Benefits, *Assessments, River basin development, River designation, Riparian rights, Wildlife conservation, Classification, Value, Environmental effects, National Wild and Scenic River Act, Preservation.

River amenity evaluation refers to the assessment of features, or conditions, in riparian environments that may provide recreational, or preservational and esthetic values. This report reviews methods of evaluating river amenity values and divides them under three main headings: River Recreation Potential Evaluation, River Esthetic Evaluation and River Preservation Evaluation. Under the first heading the different methods attempt to evaluate recreation potential of rivers by assessing the utility of physical characteristics and other environmental effects for recreation activities. These methods did not adequately represent the dynamic nature of the resource and the potential users. The two methods for evaluating river esthetics had many shortcomings, e.g., they were dependent on the evaluator's personal judgment and photographs were not considered. The evaluation of river esthetics needs to consider what effect people and their impact have on the esthetic quality of the resource. Under the heading of River Preservation Evaluation the methods reviewed are designed to assess the suitability of rivers or river segments for classification in state or federal river preservation programs. The passage of the National Wild and Scenic River Act (PL 90-542) in 1968 instigated the classification of rivers for preservation and recreation purposes. In order to improve the methods they should (1) be capable of identifying and predicting change and its impact on amenity values; (2) incorporate concepts and techniques that measure the dimensions of people's feelings about specific environmental features; and (3) place more emphasis on the quality of the experience to be provided. (Iervolino-NC)

PLANNING UNDEVELOPED LAKESHORE: A CASE STUDY ON LAKE CHAMPLAIN, FERRISBURG, VERMONT,
Vermont Univ., Burlington. Dept. of Agricultural and Resource Economics.
F. O. Sargent, and P. R. Berke.
Water Resources Bulletin, Vol 15, No 3, p 826-837, June 1979. 3 Fig, 7 Ref.

Descriptors: *Water resources planning, *Planning, *Ferrisburg(VT), *Lake Champlain(VT), *Lake shores, *Land management, *Shore protection, *Recreation, *Outdoor recreation, Shores, Lakes, Land development, Land resources, Land conservation, Land use, Public access, Recreation.

Development of private lakeshores usually precedes establishment of public access, resulting in the best access areas being occupied before public access is provided. The authors present an analytical procedure developed to enable planners to classify undeveloped lakeshore areas according to their suitability for public and private uses. The undeveloped lakeshore evaluation system rated the physical characteristics of the lakeshore for five of the most common uses: (1) public beaches; (2) camping and picnicking areas; (3) boat access areas; (4) marinas; and (5) development-vacation homes, cottages, and motels. Standards for rating the lakeshore potential have been developed for the following site requirements: size, slope, soil suitability, shoreline type (sand, rock, muck, or gravel), water quality, site location, scenery, and road access. Each of these items are measured and rated on a numerical scale from 1 to 5; the basis of the rating is a comparison with other sites for a similar use in the town or region. The system is applied to Ferrisburg, VT, located on the southern reach of Lake Champlain, with a shoreline of 14 miles, 7 of which are undeveloped. Data sources for the ratings were air photos, USGS topographical maps, Soil Conservation Service maps, and other previous studies, plus a land and water visit to each site. The evaluation system was used to develop a lakeshore land use plan, the goals of which are: (1) protection of the natural lakeshore environment, including using all wetlands as conservation areas; (2) increasing the town tax base; and (3) providing more public access to the lake through a public marina and designated swimming areas. WATER SUPPLY SERVICE FOR THE URBAN POOR: ISSUES,
Colorado Univ. at Boulder. Inst. of Behavioral Science.
G. F. White.
Water Supply and Management, Vol 2, No 5/6, p 425-454, 1978. 6 Fig, 3 Tab, 33 Ref.

Descriptors: *World Bank, *Urban Poverty Program, *Urban Poor Target Population, *Water supply, *Water delivery, *Water supply development, Water demand, Urbanization, Cities, Administration, Water distribution(Applied), Water users, Water utilization.

The author outlines the critical issues involved in choosing what type of water supply service is appropriate and practicable in applying the policy of the World Bank for the urban poor to new water supply sector reports and project appraisals. The major issues involved in those decisions are: definition of target population, definition and criteria for describing alternative types of service; estimation of health benefits in relation to standards of quality and reliability; relative emphasis upon distribution and supply improvements; the thresholds of water use requiring sewerage; pricing, repayment and subsidy policy; institutional responsibility and public education; and employment generation. The Urban Poor Target Population is the greater of the absolute or relative poor populations. The objective of the Urban Poverty Program is to increase the income and consumption of the target population by: (1) reducing the cost of, or otherwise increasing access to, basic goods and services, and (2) increasing income earning opportunities and capacity. Immediate research needs for developing solutions to issues of water supply for urban poor include: critical appraisal of conspicuous successes and failures; comparative costs of alternative services and outline for and example of a study of current water use and preferences. Long term studies would include demonstration projects and systematic review of the experience with the World Bank's regular water supply and sewerage projects and with the water and sewerage components of the Sites and Services programs. WATER RESOURCES DEVELOPMENT BY THE U.S. ARMY CORPS OF ENGINEERS IN NORTH CAROLINA.
Army Engineer Div. South Atlantic, Atlanta, GA.
January 1979. 123 p, 9 Maps, 35 Photos.

Descriptors: *Water resources development, *Flood control, *U.S. Corps of Engineers, *North Carolina, *Navigation, *Multiple-purpose projects, *River basins, *Coastal areas, Reservoirs, Project costs, Economics, Water demand, Federal government, Planning, Channel improvement, Water resources, Coastal plains, Beach erosion.

This report describes the scope and progress of water resource projects and studies by the U.S. Corps of Engineers in North Carolina. The functions of the Corps and initiation, authorization and construction of projects are described. Specific projects for the Coastal Area are presented, including 41 navigation projects, flood control in 15 areas, snagging and clearing, and beach erosion control. Studies and surveys underway and authorized are listed. There are 3 active coastal-wide projects--alteration of the Beaufort and Morehead City Railroad Bridge, aquatic plant control in estuarine waters, and the Atlantic Intracoastal Waterway. Corps projects are presented for each of eight river basins--Roanoke, Pamlico-Tar, Neuse, Cape Fear, Yadkin-Pee Dee, Santee-Catawba, Kanawha-New, and Upper Tennessee Basins. Two multipurpose projects are located in the Roanoke Basin--the John H. Kerr Dam and Reservoir with a total capacity of 2,750,349 acre-feet, installed power capacity of 204,000 kilowaters, and a drainage area of 2,750,349 sq mi above the dam, provides flood control, generation of hydroelectric power, recreation, fish and wildlife preservation and low-flow control, with cost to date of $88,362,641; and Philpott Lake, located on the Smith River, with a drainage area of 212 sq mi above the dam and total cost to date of $14,120,308. Falls Lake in the Neuse River Basin was authorized in 1965 as a flood control project. Projected completion is 1981. It will operate as part of a coordinated system for water supply, water quality and recreation. Total estimated cost is $100,000,000. Several projects have been deauthorized, one in the Yadkin-Pee Dee Basin and several in the Piedmont region. Statistical data are provided on a project-by-project basis, and maps show locations of the various projects. (Cooper-NC)

ESTIMATED WATER USE IN FLORIDA, 1977,
Geological Survey, Tallahassee, FL. Water Resources Div.
S. D. Leach, and H. G. Healy.
Geological Survey Water-Resources Investigations 79-112, 1980. 76 p, 4 Fig, 21 Tab, 28 Ref.

Descriptors: *Water utilization, *Florida, *Consumptive use, *Withdrawal, Municipal water, Irrigation water, Industrial water, Water supply, Thermal powerplants, Saline water, Freshwater.

During 1977, an average of 21,466 million gallons of water was withdrawn daily for use in Florida--an increase of 6,153 million gallons per day since 1970. The 1977 daily use was 14,812 million gallons of saline water and 6,654 million gallons of freshwater. Most of the saline water, largely surface water, was pumped from tidal estuaries. Only 107.6 million gallons per day of saline water--less than 1 percent--was obtained from wells. Thermoelectric power generation used virtually all the saline water, 14,738 million gallons per day, whereas all other industrial uses were only 73 million gallons of saline water per day. The freshwater supply was almost equally divided between ground water (53 percent) and surface water (47 percent). Of the total freshwater used, 43 percent was for irrigation--an average of 2,873 million gallons of freshwater daily on the average. The remaining daily use of freshwater was 21 percent for thermoelectric power generation, 19 percent for public supply; 14 percent for industrial use other than thermoelectric power generation; and 3 percent for domestic and rural use. Irrigation was also responsible for the greatest consumption during 1977, with 1,255 million gallons consumed daily which also includes 192 million gallons per day conveyance loss. (Kosco-USGS)

Descriptors: *Conflicts, *Water quality, *Energy production, *Water pollution control, *Water supply, *Groundwater resources, Political aspects, Political constraints, Administration, Decision making, Programs, Planning, Conservation, Preservation, Environmental Policy Analysis Program, Environmental effects, Energy, Evaluation, Analysis.

The United States in the last decade has pursued two high priority goals: maintenance of high quality natural environments and achievement of energy independence. The pursuit of these two goals has resulted in numerous conflicts; this has led to the establishment of the Environmental Policy Analysis Program by the Energy Research and Development Administration (ERDA) which is now incorporated into the Department of Energy (DOE). The purpose of this program is to improve the formulation of energy development policies; it has been supported by detailed analysis conducted by the Pacific Northwest Laboratory (PNL), of specific issues related to the conflicts between energy development and environmental quality. These conflicts can be described and understood in terms of one or more of the following policy environment characteristics: resource scarcity, sense of urgency, lack of experience, administrative complexity, uncertainty about future policies and regulations, technological complexity and uncertainty about impacts. Two conflicts that were singled out because of their significance to DOE are (1) the contention by industry that certain regulations had been based on inadequate data, and (2) the energy development problems associated with water supply shortages in the arid West. Three prospective points of conflict identified are Best Available Treatment effluent limitations; the mandated regulations for controlling toxic and hazardous substances; and the new programs for controlling ground water quality. Resolving conflicts can be accomplished through an analysis of the policy environment and its characteristics which can provide a useful framework for the identification and selection of alternative actions. 6E. Water Law and Institutions

A STATE OF KNOWLEDGE ON INDIAN WATER RIGHTS IN KANSAS,
Kansas Water Resources Research Inst., Manhattan.
D. C. Collins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-170632, Price codes: A03 in paper copy, A01 in microfiche. Project Completion Report, February 1980. 48 p, 5 Fig. OWRT A-093-KAN(1).

Descriptors: *Kansas, *Indian reservations, *Water rights, *Riparian rights, Prior rights, Water law, Appropriation, Adjudication procedure, Equitable apportionment, Land tenure, Reservation doctrine, Water allocation(Policy), Federal jurisdiction, Irrigation water.

Much uncertainty surrounds Indian water rights in Kansas since they may be in conflict with State given rights to water. The ever increasing shortage of water in the arid areas of Kansas is forcing the State to clarify Indian water rights to avoid continuing and future conflicts. Kansas water law subscribed to both riparian water rights and to appropriation which provides all users as much water as they need toward a beneficial use. If the water supply is not adequate then those 'first in time' are 'first in right'. This leads to problems of whether or not Indian reserves were 'first in time'. Indian land tenure in Kansas is discussed for the original tribes as well as those brought to Kansas reservations from other states. Many tribes are involved including the Kansas, Osage, Wichita, Pawnee, Commanche, Apache, Kiowa, Cheyenne, Arapaho, Cherokee, Ottawa, Kickapoo, and others. Major areas of concern in Kansas Indian water rights are: (1) interstate water allocations, (2) Indian allotees rights including non-Indian owners, and (3) reservation Indian rights. One solution would be the computation of irrigable acreage for reservations and the projection of water use involved. This computation, while not a permanent, legal judgement, could be used as a guideline in disputes. Kansas must press the Federal Government for ascertainment and adjudication of water rights so that good planning can preclude conflicts. (Seigler-IPA)

THE OUTER CONTINENTAL SHELF LANDS ACT AMENDMENTS OF 1978,
Department of Commerce, Washington, DC.
R. O. Jones, W. J. Mead, and P. E. Sorenson.
Natural Resources Journal, Vol 19, No 4, p 885-908, October 1979.

Descriptors: *Continental shelf, *Resources development, *Mineral industry, *Oil industry, Legislation, Federal government, Administrative agencies, Leases, Bids, Oil pollution, Energy, Drilling.

The purpose of the 1953 Outer Continental Shelf Lands Act (Act) is to regulate the granting of mineral leases on the Outer Continental Shelf (OCS) by the federal government. The Act authorizes the Secretary of the Interior to grant mineral leases and to prescribe regulations for their administration. The 1978 Amendments respond to several areas of criticism of the 1953 Act: (1) Dissatisfaction with the primary leasing method in use - cash bonus bidding with a fixed royalty; (2) Coastal states desire to exercise more control of off-coast energy exploration; and (3) Desire for increased federal supervision of off-shore energy resources. Whereas the 1953 Act authorized only cash bonus or royalty bidding, the Amendments specify eight alternative bidding systems. Recent research shows that competition under the new bidding system has not been as intense as predicted. The 1978 legislation also mandates a significant expansion in economic planning by the Interior Secretary. These plans must be submitted to the governors of affected states for review and comment. The new legislation also provides for funds to compensate for damages arising from energy production from the OCS. (Wilson-Florida)

USE IT AND LOSE IT - SURFACE WATER RIGHTS IN IDAHO,
S. W. Reed.
Idaho Law Review, Vol 15, No 3, p 569-590, Summer 1979.

Descriptors: *Idaho, *Surface waters, *Public access, *Water quality control, Judicial decisions, Legal aspects, Public rights, Legislation, State governments, Water resources, Water rights, Water conservation.

The inevitable rush to ruin is occurring upon the natural lakes and rivers of Idaho. These lakes and rivers have been a recreational commons open for all to use. In recent years ruinous pressures have come from a rapidly increasing Idaho population and a growing use by non-residents. Conflicts over surface water rights arise in the courts and in federal, state and local governments. The judicial power over the surface waters of lakes and rivers is founded upon the public trust doctrine. The public trust doctrine has been applied to prohibit the issuance of permits to appropriate water for energy production facilities. The doctrine is not limited to prohibitions against private uses of the beds and surface waters, but may also be applied to public entities. A wide assortment of federal statutes have potential applicability to Idaho's waters, including the Rivers and Harbors Act of 1899. Idaho state control comes from the 1974 Lake Protection Act. The Act does little more than set up procedures to grant permits for various types of encroachments. County control comes from the 1975 Local Planning Act. (Wilson-Florida)

SPECIAL CONSIDERATIONS INVOLVING INDIAN RIGHTS,
Clyde and Pratt, Salt Lake City, UT.
E. W. Clyde.
Natural Resources Lawyer, Vol 8, No 2, p 237-252, 1975.

Descriptors: *Indian reservations, *Riparian rights, *Water allocation(Policy), Federal government, Water law, Riparian land, Diversion, Federal reservations, Agriculture, Water rights, Priorities.

Most of the land in the contiguous western states was obtained by the United States through the exercise of its sovereign powers. Since the United States originally owned the land, all settlers were trespassers. On the water rights issue, the courts ruled against riparian settlers and in favor of the first appropriator, because the settlers, owning no lands, were not in a position to assert the riparian rights doctrine. An exception to this rule of prior appropriation is the concept of reserved rights for Indians, generally known as the Winters Doctrine. Cases have arisen concerning the amount of water reserved for the Indians. The Indian water is held in trust by the federal government for the Indians. The power of the United States to reserve water could be based on its treaty powers. The Indians have a prior right to the water based on the date the Indian reservation was created. The water reserved for the Indians is not measured by past use, but by present and future needs. This determination is a judicial one for the federal courts. (Wilson-Florida)

THE RESOURCE CONSERVATION AND RECOVERY ACT OF 1976 - THE NEWEST ENVIRONMENTAL 'SLEEPER'.
American Bar Association, Washington, DC. Committee on Environmental Controls.
The Business Lawyer, Vol 33, No 3, p 2555-2585, July 1978.

Descriptors: *Hazardous wastes, *Solid wastes, *Waste disposal, Permits, Agricultural runoff, Mine wastes, Waste dumps, Regulation, Administration, Water pollution.

These are the minutes of a program conducted by the American Bar Association's Environmental Controls Committee during which the 1976 Resource Conservation and Recovery Act (RCRA) was discussed. The discussion is focused on the RCRA's waste disposal regulating provisions. The RCRA amended the existing Solid Waste Disposal Act. Discussion is centered on the two major programs added by RCRA: (1) a hazardous waste management program; and (2) a program for phasing out solid waste open dumping. There are possible areas of overlapping between the RCRA and other federal laws. Potential problems the federal Environmental Protection Agency might face in administering the RCRA are discussed. These include: (1) defining those hazardous wastes to be regulated; (2) creating substantive standards for generators, transporters and owners or operators of facilities which treat, store, or dispose of hazardous wastes; and (3) obtaining state involvement. Potential sanctions for RCRA violations are examined. The Committee feels the RCRA has potentially widespread applicability and impact. (Daniels-Florida)

THE INLAND WETLANDS ACT: RECONCILING A COLLISION OF INTERESTS,
R. M. Hall, Jr.
Connecticut Bar Journal, Vol 48, No 1, p 3-29, March 1974.

Descriptors: *Connecticut, *Wetlands, *Permits, Preservation, Protection, Constitutional law, Regulation, Conservation, Legislation, Real property.

The provisions of Connecticut's Inland Wetlands Act are examined. There is a potential collision of interests between private landowners and the public at large resulting from the Act. The Act and administrative regulations attempt to resolve this potential collision. An analysis of past Connecticut wetlands cases provides insight into the reception the Act is likely to receive in court. The Act was passed as a response to concern over the need to protect and preserve inland wetland areas. Protection of wetlands is a proper legislative subject. Protection of wetlands is achieved by a permit system. Any regulation of private property raises potential conflicts of interest. The taking issue and the nuisance abatement theory are examined. The taking issue is divided into three theories: (1) the Physical Invasion Theory, which almost always requires compensation; (2) The Diminution of Value Theory, where the granting of relief is optional; and (3) the Benefit-Harm Balancing Theory. For a permit denial to be an unconstitutional taking there must be a total or nearly total destruction of the property's value, or the property must be rendered useless for any practical purpose. The Act, as a whole, is valid. (Daniels-Florida)
W80-04576

PROPERTY RIGHTS: INTERTRIBAL MINERAL RIGHTS IN THE ARKANSAS RIVERBED,
J. T. Branam.
American Indian Law Review, Vol II, No 1, p 125-135, Summer 1974.

Descriptors: *Arkansas, *Indian reservations, *Ownership of beds, *River basin development, Treaties, Boundary disputes, Patents, Legal aspects, Beds under water, Water law, Navigable waters.

The claims of three indian tribes, the Cherokees, the Choctaws and the Chickasaws, to the mineral rights in the stream bed of the Arkansas River are discussed. The U.S. Supreme Court ruled that the mineral rights in the Arkansas River belong to the Indian tribes, but did not settle the legal rights among the Indians. The general positions of the three tribes are given, including some of the supporting arguments of each position. Treaties and case law supporting each tribe's position are discussed and analyzed. Some possible courses of action to support each tribe's claim are discussed. General property principles are mentioned, but not fully discussed. No attempt is made to determine where the equitias lie. All positions are presented objectively. No final solution to the settlement of the Indian tribe's claims is offered. (Daniels-Florida)

BLUE LAKE: A STRUGGLE FOR INDIAN RIGHTS,
American Univ., Washington, DC.
J. J. Bodine.
American Indian Law Review, Vol I, No 1, p 23-32, Winter 1973.

Descriptors: *New Mexico, *Indian reservations, *Federal government, *Water allocation(Policy), National forests, Water rights, Treaties, History, Administrative agencies, Legislation, Water resources, Land use.

On December 15, 1970, the President of the United States (U.S.) signed into law House Bill 471, which gave trust title to 48,000 acres of land to the Taos Pueblo Indians of New Mexico. This ended a 64-year struggle by the Taos to regain their sacred Blue Lake and the high mountain land which surrounds it. This was the first time in the history of U.S.-Indian relations that a claim for land, based on the practice of aboriginal religion, successfully ended in the restoration of that land to an Indian reservation. The U.S. took over the entire region in 1848, assuming sovereignty under the Treaty of Guadalupe Hidalgo. Soon after, Anglo-American settlers began to filter into the area and settle on the traditional lands of the Taos. Blue Lake is the primary water supply source of the pueblo and consequently was of great importance to the area's agriculture. Repeatedly, the Taos made known their claims to portions of the land as non-Indian encroachment increased. Their struggle ended with House Bill 471. (Wilson-Florida)

GOVERNMENT REGULATION OF OIL POLLUTERS: HOW MUCH IS ENOUGH,
M. N. Mervin.
Administrative Law Review, Vol 29, No 4, p 603-609, Fall 1977.

Descriptors: *Regulation, *Oil pollution, *Administrative agencies, *Water pollution control, Legal aspects, Federal government, Oil industry, Legislation, Oil spills, Water law, Transportation, Environmental effects.

Although there has been considerable public debate over excessive government regulation, one type of overregulation has eluded the public eye - illegal, federal overregulation. An example of this type of violation is the Navigation Safety Regulations promulgated on January 31, 1977. The Secretary of Transportation declared that the new Regulations were tanker regulations developed to prevent oil spills. However, the regulations were promulgated not under the Tanker Act, but under a statute that authorizes control of vessel traffic under certain hazardous circumstances. This statute gives no general authority to prescribe navigation safety rules for all vessels everywhere. Another example of illegal overregulation is the regulation on Marine Portable Tanks. These regulations rely simultaneously on the Tanker Act and the Dangerous Cargo Act. However, the definitions of these acts are inconsistent. Moreover, these regulations have been issued without notice or opportunity to be heard, contrary to the Administrative Procedure Act. The irony in these cases of illegal regulation is that there is ample statutory authority to accomplish such regulation. (Wilson-Florida)

MUCH ADO ABOUT SOMETHING - DISPUTE SETTLEMENT AND THE LAW OF THE SEA CONVENTION,
National Security Council, Washington, DC. Interagency Task Force on the Law of the Sea.
R. H. Hull.
International Lawyer (A.B.A.), Vol 11, No 2, p 365-368, Spring 1977.

Descriptors: *Law of the Sea, *International commissions, *Negotiations, United Nations, Foreign countries, Treaties, International waters, Conferences, Oceans, Political aspects, International law.

For years, diplomats from many lands have been talking about the need for a new and equitable convention for the oceans. In general, the talk has focused on substantive matters. Recently, however, attention has begun to focus on an ostensible procedural question - the settlement of disputes arising out of the proposed Law of the Sea Convention. Implementation of a dispute settlement mechanism faces two primary problems. First, some states are reluctant to submit disputes to international forums for resolution. Second, many states are reluctant to have their disputes resolved by a third party. Assuming these two hurdles are overcome, the remaining question concerns the proposed provisions themselves. The dispute settlement procedure should, among other things, provide that: (1) parties may choose the means to resolve disputes; (2) methods for conciliation; (3) provisional measures to preserve the rights of the parties; (4) obligations to settle disputes by resort to arbitration or judicial settlement; and (5) disputes may only be submitted to the forum chosen by the party against which the proceedings are instituted. (Wilson-Florida)

THE CONCEPT OF FREE SEAS: SHAPING MODERN MARITIME POLICY WITHIN A VECTOR OF HISTORICAL INFLUENCE,
Pittsburgh Univ., PA. School of Law.
G. P. Smith, II.
International Lawyer (A.B.A.), Vol 11, No 2, p 355-363, Spring 1977.

Descriptors: *History, *Law of the Sea, *International law, Political aspects, Economics, Oceans, United Nations, Military aspects, Foreign countries, Conferences.

The concept of free seas entails conflicts and compromises. Both the politics of freedom and the concept of sovereignty have shaped the freedom of the seas and territorial waters. The historical concept of freedom of the seas, as to both ownership and use, was formulated early as a legal principle in the Roman characterization of the sea as the common property of all. In the Middle Ages, when Venice became a center of commerce, there was a strong competition among nations for use of the seas. Territorial supremacy became synonamous with sovereignty. The early politics of freedom, not sovereignty, shaped the English concept of the seas. This concept of freedom was the dominant principle by the twentieth century. Today, the United Nations Law of the Sea Conference considers anew the problems of contiguous zones and the extent of their application, exclusive economic zones, territorial seas, and coastal state jurisdiction. The continuing conflict is between expansion of sovereignty and the need for free, open seas. (Wilson-Florida)

ENVIRONMENTAL LAW (RESOURCE UTILIZATION, WATER POLLUTION AND AIR POLLUTION),
A. Rothstein, and D. R. Koss.
Annual Survey of American Law, Vol 1977, No 2, p 303-364, 1977.

Descriptors: *Resource development, *Industrial wastes, *Water pollution control, Legislation, Judicial decisions, Administrative agencies, Water pollution, Environmental effects, Energy, Mining, Legal aspects.

The national policy of establishing self-sufficiency in energy supplies has resulted in accelerated development of resources under federal control and increased impetus to energy research and development often at the expense of environmental quality. Some recent federal legislation bypasses the requirements of the 1969 National Environmental Policy Act (NEPA), and the courts have refused to construe NEPA more broadly than in past decisions. Part I examines three areas in which these trends have been evolving. First, legal challenges to the development of oil and natural gas resources on the outer continental shelf have revealed limits to NEPA's efficacy. Second, development of coal reserves in the northern Great Plains region has been encouraged by the 1975 Federal Coal Leasing Amendments Act and by the Supreme Court's conclusion that a regional environmental impact statement is not currently required prior to development. Third, commerce clause and federal preemption challenges have been raised against states attempting to exclude waste generated out-of-state. Part II discusses the Supreme Court's decision that the Environmental Protection Agency had authority to promulgate general regulations limiting the quantities of pollutants that may be discharged from existing industrial outlets. (Wilson-Florida)

COASTAL ZONE MANAGEMENT - A FEDERAL PERSPECTIVE,
National Oceanic and Atmospheric Administration, Washington, DC. Office of Coastal Zone Management.
R. W. Knecht.
Coastal Zone Management Journal, Vol 1, No 1, p 123-128, Fall 1973.

Descriptors: *Coasts, *Management, *Federal governments, *Governmental interrelations, Coastal engineering, Legislation, Coordination, Zoning, Local governments, State governments, Conservation.

The interrelationship between, and the rule of, local, state and federal government in coastal zone management is examined. Emphasis is on the federal government's involvement, including the changing role of the federal government. Some principles involved in this area are clarified. Important new directions being set in coastal zone management are discussed. A brief history of and the reasons for the level of each government's involvement is included. Effective coastal zone management requires coordination between governmental actions. The 1972 Coastal Zone Management Act (Act) was intended to enhance a coordinated effort. This Act is analyzed to define the new role of the federal government in coastal zone management, and to clarify the new directions being taken. Incentives to motivate state action, within and outside the Act, are briefly discussed. The Act will markedly improve management of coastal lands and resources. (Daniels-Florida)

CONGRESS AND COASTAL ZONE MANAGEMENT,
Senate, Washington, DC.
E. F. Hollings.
Coastal Zone Management Journal, Vol 1, No 1, p 115-118, Fall 1973.

Descriptors: *Legislation, *Coasts, *Shore protection, *Administrative agencies, Conferences, Federal government, Oceanography, Seashores, Legal aspects, Coasts, Oceans.

On October 5, 1972, the Coastal Zone Management Act (Act) cleared its final major hurdle - the Senate-House Conference - which paved the way for Congressional approval. Senate and House con-

currence on the Conference was unanimous, and the Act proceeded to the President where it was signed into law. Significant personal contributions were made during the Congressional deliberations. The National Academy of Sciences, including the Coordinating Committee on Oceanography in the early 1950's, accomplished much, and the 1959 Report of the Committee on Oceanography of the Academy was a landmark. A key issue in the Senate-House Conference was the amendment which had been made to the House Merchant Marine and Fisheries Committee bill. Members of the House Interior and Insular Affairs Committee succeeded in having the Secretary of the Interior named as the responsible federal official under the Act. The result of the Conference Committee deliberations, however, was that the federal coastal zone management program of assistance to states should be vested in the federal agency with the requisite technical expertise -- the National Oceanic and Atmospheric Administration. (Wilson-Florida)

SHORELAND ZONING IN MAINE,
Maine Univ. at Orono.
W. E. MacDonald.
Coastal Zone Management Journal, Vol 1, No 1, p 109-114, Fall 1973.

Descriptors: *Maine, *Shore protection, *Zoning, Legislation, State governments, Local governments, Land use, Environmental control, Shores, Water quality control, Administrative agencies.

In 1971, the Maine Legislature passed the Shoreland Zoning Law (Law). The Law called for mandatory shoreland zoning and subdivision controls. When the bill came out of committee the area to be so zoned had been modified downward to a narrow 250-foot strip of land adjacent to the state's lakes, rivers and ocean. To rezone all this area by July 1, 1973 was a formidable task for a state made up of independent minded towns and cities. Less than 20% of the 496 municipalities had previously adopted zoning. Maine's Shoreland Zoning Project provides technical assistance to state's towns, cities and plantations to enable them to prepare local plans and ordinances needed to comply with the Law. Some of the more important standards for guidance include: (1) protection of water quality; (2) building 75 foot setbacks; (3) leaving of trees; (4) guidelines for bulldozing; and (5) guidelines for wastes and chemicals. The guidelines have been well received locally because communities wanted simple guidelines to follow. (Wilson-Florida)

COASTAL ZONE MANAGEMENT - A NEW APPROACH IN CALIFORNIA,
P. M. Douglas.
Coastal Zone Management Journal, Vol 1, No 1, p 1-25, Fall 1973.

Descriptors: *California, *Coasts, *Resources development, *Permits, Legislation, Conservation, Regional development, Management, Zoning, Recreation, Recreation facilities.

California's new approach to coastal zone management - Proposition 20 - is examined. The new law created one state and six regional commissions to prepare a comprehensive, long-range plan for the conservation and use of California's coastal zone resources. The commissions exercise strict permit controls over new developments during the planning process. Discussed are the following: (1) the history of Proposition 20; (2) why California took this approach; and (3) Precedents for a Proposition 20 approach. The major objectives of the new law are outlined and discussed. Why the new law is limited to only coastal lands is explored. The new law's strength is found in its interim permit control system, the importance of which is discussed. The impact of Proposition 20's first eleven months as law is examined. There is a brief discussion on some logistical difficulties in getting the program started. Procedures used by the commissions, to reduce the permit workload and to further the new law's objectives are discussed. The commissions' significant problems are funding, enforcement, permit conditions, and consistency of permit decisions. Proposition 20's effect on property values is explored. (Daniels-Florida)

THE ROOTS OF U.S. FISHERIES POLICY,
Johns Hopkins Univ., Washington, DC. School of Advanced International Studies.
A. L. Hollick.
Ocean Development and International Law Journal, Vol 5, No 1, p 61-105, 1978.

Descriptors: *Fisheries, *Law of the Sea, *United States, Foreign countries, Fishing, Fish management, International law, United Nations, Conferences, Fish conservation, Anadromous fish.

The roots of the present United States (U.S.) fisheries policy and the 200-mile zone may be found in the period from World War II to the 1958 United Nations Conference on the Law of the Sea. Economic and technological developments during the war increased pressures for access to offshore living resources. Change in the international political system was also accelerated by the war. U.S. fisheries policy in the post war period was characterized by efforts to protect the status-quo's special interests. U.S. fishing groups and problem areas can be divided into three geographical areas - the Northwest Atlantic Ocean, The Northeast Pacific Ocean, and Latin American offshore waters. The Northwest Atlantic area has been plagued by a problem of overfishing by the United States, Canada and European nations. Relations with Latin American nations has been complicated by the implementation of the 200-mile economic zone. The overfishing of salmon in the Pacific has troubled relations between the United States and Japan. Disparate U.S. fishing interests have complicated the State Department's task of setting a single policy satisfactory to all U.S. interests. (Wilson-Florida)
W80-04587

CHANGES IN THE LAW OF THE SEA: IMPACT ON INTERNATIONAL FISHERIES ORGANIZATIONS,
Washington Univ., Seattle. Inst. for Marine Studies.
E. L. Miles.
Ocean Development and International Law Journal, Vol 4, No 4, p 409-444, 1977. 3 Tab.

Descriptors: *Law of the sea, *Fisheries, *International commissions, United Nations, Conferences, Fish management, Jurisdiction, Negotiations, Fishing, Economic impact, International law.

Impending changes in the Law of the Sea may have important implications for regional fishery commissions, for the Committee on Fisheries and the Department of Fisheries of FAO, and for FAO programs of technical assistance to fisheries. The trend in recent years has been for coastal states to extend their jurisdiction over fisheries. The Informal Single Negotiating Text of the Third United Nations Conference on the Law of the Sea recommends exclusive economic zones of up to a 200-mile limit. The combination of three major factors will effect the fishery commissions: (1) the trend toward coastal state sovereignty over living resources in the economic zone, including the determination of the allowable catch; (2) the imposition of coastal state controls over scientific research; and (3) most coastal states with increased authority over fisheries currently lack the capacity to manage these resources. In order to respond to these changes, FAO-sponsored commissions should assume greater management responsibilities and increase technical assistance and research. There is an obvious need to seek increased funding. (Wilson-Florida)
W80-04588

THE LAW OF THE SEA AND MANAGEMENT OF ANADROMOUS FISH STOCKS,
Simon Fraser Univ., Burnaby (British Columbia).
P. Copes.
Ocean Development and International Law Journal, Vol 4, No 3, p 233-259, 1977. 42 Ref.

Descriptors: *Law of the sea, *Anadromous fish, *Fish management, *Fish migration, International law, Oceans, Fisheries, Fishing, United Nations, International commissions, Jurisdiction, Treaties.

Unilateral declarations of 200-mile fishing zones by coastal states are likely to find recognition in new articles of international law. These probably will conform to the articles of the Single Negotiating Text, designed to protect and strengthen the fisheries rights of coastal states. The new rules may prove counterproductive as to the major salmon stocks that migrate beyond 200-mile limits. Effective protection of state-of-origin rights on the high seas will be difficult. Distant water fishing fleets will be tempted to intensify their efforts on high seas stocks. Salmon interception by neighboring states will also remain a problem. Several protective strategies and accomodations may be pursued by states-of-origin. One is to establish an international authority charged with regulating high seas fisheries. Another approach is to buy off individual states which have the inclination to fish for salmon on the high seas. Interception problems might be solved by joint management of stocking and fishing. (Wilson-Florida)

FROM CARACAS TO GENEVA TO NEW YORK: THE INTERNATIONAL SEABED AUTHORITY AS A CREATOR OF GRANTS,
Purdue Univ., Lafayette, IN. Dept. of Political Science.
M. E. Galey.
Ocean Development and International Law Journal, Vol 4, No 2, p 171-193, 1977. 1 Tab.

Descriptors: *Law of the sea, *Mining, *International commissions, International law, United Nations, International waters, Jurisdiction, Oceans, Treaties, Conferences, Mineral industry.

In 1970, the United Nations General Assembly adopted the Declaration of Principles on the Peaceful Uses of the Seas Beyond the Limits of National Jurisdiction. The Group of 77 has proposed an International Seabed Authority (ISA) empowered to control directly all activities in the international seabed area. The United States supported an ISA empowered to provide the opportunity for mining interests to explore and exploit resources in the area relatively free of production and other types of controls. A seldom discussed economic approach, the grants approach, may help explain the conflict between the U.S. and the Group of 77. Agreement on the ISA might occur when the different assumptions as to who is grantor and who the grantee coincide. At that point, the mix of grants and exchanges would be acceptable to both parties. If the ISA were established, it would create grants to the international community. However, the critical issue in explaining the conflict is to determine the identity of the grantor and grantee. (Wilson-Florida)

WATER BASED RECREATIONAL DEVELOPMENTS IN MICHIGAN - PROBLEMS OF DEVELOPERS,
Wayne State Univ., Detroit, MI.
R. W. Bartke, and S. H. Patton.
Wayne Law Review, Vol 25, No 4, p 1005-1063, July 1979.

Descriptors: *Michigan, *Lake shores, *Public access, Legislation, Water allocation(Policy), Riparian land, Recreation demand, Riparian rights, Development, Water law, Conservation.

More people than ever before desire access to waterbodies for recreational purposes. This demand intensifies pressures on the inland water resources of Michigan. High cost and decreasing availability of suitable property often preclude the development of single unit, horizontal subdivisions on waterfront lots. The system of water rights which predominates in Michigan is riparianism. Riparian rights arise by virtue of title to the bank or shore and cannot be conveyed separately. The use of private waters is limited to riparian owners. Limitations on lake shore developments and water

use include: (1) federal, state and local legislation; (2) financing; and (3) common law limitations, such as the reasonable use doctrine and narrow definitions of riparian owners. Developers have used various tools to extend lake access and use. Traditional lake shore developments include: (1) developments abutting the water; and (2) developments with backlots, such as tenancies in common, condominiums, and homeowners' associations. Developers are now providing consumers with a more complete package by the use of condominuims, cooperatives, and planned unit developments. At the same time, developers must be alert to judicial and legislative action affecting the use and improvement of waterfront property. (Wilson-Florida)

WATER RESEARCH AND DEVELOPMENT ACT OF 1978 - LEGISLATIVE HISTORY.
H.R. Rep No 1156, 95th Cong, 2nd Sess (1978), reprinted in 11 U.S. Code Cong and Ad News 4991 (1978).

Descriptors: *Research and development, *Water supply development, *Water resources development, Water resources research act, Impaired water use, Research facilities, Saline water, Administrative agencies, Grants, Programs, Information exchange.

The purpose of the 1978 Water Research and Development Act (Act) is to extend and modernize the organic charter controlling the water resources research and saline water conversion programs of the Department of the Interior. This Act substantially reenacts the Water Resources Research Act of 1964 and the Saline Water Conversion Act of 1971. The policy objectives are twofold. First, that general water resources research programs and saline conversion programs have separate sources in law. Second, that all authorizations for funding will be on a two-year cycle. There are four titles: Title I - Water Resources Research and Development; Title II - Water Research and Development for Saline and other Impaired Waters; Title III - Technology Transfer and Information Dissemination; and Title IV - General Provisions. The Committee on Interior and Insular Affairs adopted one amendment which, among other changes, converted all appropriations authorizations to specific amounts. The inflationary impact of the Act will be minimal and will be offset by its affirmative benefits. The Committee on Interior and Insular Affairs will maintain continuing oversight of the programs authorized. The Assistant Secretary of the Interior filed on executive communication with the Speaker of the House, explaining the Act and recommending its passage. (Wilson-Florida)
W80-04592

WATER RESEARCH AND DEVELOPMENT ACT OF 1978.
Act of Oct 17, 1978, Pub L. No 95-467, 92 Stat 1305, 11 U.S. Code Cong and Ad News (1978) (codified at 42 U.S.C. 7801 et seq).

Descriptors: *Research and development, *Water resources development, *Water supply development, Impaired water use, Grants, Saline water, Administrative agencies, Research facilities, Information exchange, Programs, Water resources research act.

The purposes of the 1978 Water Research and Development Act (Act) are to provide a water supply to meet the nation's needs, to preserve water resources, and to promote research and conservation. In Title I - Water Resources Research and Development - the Secretary of the Interior is authorized to assist in carrying on the work of a qualified water resources research and technology institute in each state. These institutes shall submit annual reports to the Secretary. The Secretary is charged with the proper administration of this title, and may prescribe such rules and policies as are necessary to carry it out. In Title II - Saline and other Impaired Waters - the Secretary is authorized to conduct and promote research to develop effective methods for conversion of impaired water into water for beneficial uses. The Secretary may conduct cooperative agreements with non-federal utilities and governmental entities. In Title III - Technology Transfer and Information Dissemination - the Secretary is authorized to transfer research and development results to other organizations for further development. Further, the Secretary is authorized to maintain a national center for the dissemination of water resources research information. To carry out the program funds are appropriated on a cost-sharing basis. (Wilson-Florida)
W80-04593

WATER RESOURCES DEVELOPMENT ACT OF 1978.
Hearings Subcomm on Water Resources, Comm on Public Works and Transportation, U.S. House, June 20,21,22 and 27, 1978, Serial No 95-60, p 518.

Descriptors: *Flood control, *Navigable waters, *Water resources development, Floods, Navigation, Navigable rivers, Dredging, Economic impact, Engineering, Engineers estimates.

H.R. 13059 was introduced in the House of Representatives on June 8, 1978 as a bill authorizing the 'construction, repair, and preservation of certain public works on rivers and harbors for navigation, flood control, and for other purposes.' The bill then lists thirteen projects for which improvement is authorized. The bill also makes several amendments to the 1976 Water Resources Development Act. The Secretary of the Army, acting through the Chief of Engineers, is given authority to undertake many different activities in a number of geographical areas: (1) the control of river and harbor ice; (2) the construction of bank protection works; (3) the implementation of flood control measures in general; and (4) the performance of intermittent dredging to remove shoals. The bill also discusses costs of the various projects and the percentage that will be paid by the federal government. The report of the daily hearings on the bill is extremely extensive. The Act is to be cited as the 'Water Resource Development Act of 1978.' (Tabano-Florida)

KANSAS WATER RIGHTS: MORE RECENT DEVELOPMENTS,
Kansas Supreme Court, Topeka. Disciplinary Administrator.
A. Windscheffel.
The Journal of the Kansas Bar Association, Vol 47, No 3, p 217-223, Fall 1978.

Descriptors: *Consumptive use, *Kansas, *Water rights, Riparian rights, Legal aspects, Ground water, Indian reservations, Damages, Remedies, Eminent domain.

Summarized are recent court decisions and legislation affecting surface and groundwater rights in Kansas. Emerging from the 1978 session is Senate Bill 523. This Act requires all persons claiming vested rights for the beneficial use of water, other than domestic uses, which have not been determined pursuant to a previously repealed statute shall file a verfied claim with the chief engineer by July 1, 1980. With few exceptions, vested rights to water in Kansas within the scope of this Act will be resolved after the above date. A preliminary analysis of several cases involving damages sought for unlawful water collection and diversion presents an apparent conflict. The court appears confused over when damage has accrued, and when the statute of limitations begins to run in such actions. Injunctive relief in cases of water pollution is also analyzed. There is an apparent need to harmonize statutory law with present conceptions, needs, and changing conditions in Kansas. (Schwerer-Florida)

INTERGOVERNMENTAL ASPECTS OF WATER TRANSFER IN IDENTIFICATION AND ASSESSMENT OF FEDERAL AND INTERSTATE ISSUES AND CONSTRAINTS,
Oklahoma State Univ., Stillwater. Dept. of Political Science.
J. W. Westphal, and J. J. Lawler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-173578, Price codes: A03 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute. Oklahoma State University Technical Completion Report, April 1980. p 30, 3 Fig, 4 Tab. OWRT A-084-OKLA(1), 14-34-0001-9038.

Descriptors: *Oklahoma, Interstate, *Interstate commissions, *Interstate compacts, *Interstate rivers, River basin commissions, River basins, Texas, Kansas, Arkansas, Federal Government, Water resources development, Water supply development, River basin development, *Water transfer.

Intergovernmental aspects of water transfer from eastern to central and western Oklahoma were analyzed vis-a-vis three neighboring states (Texas, Arkansas, and Kansas). The three major objectives of the study were: to identify new proposals and developments since release of Phase I of the Oklahoma Comprehensive Water Plan; to identify major inter-state and national-state issues raised by the plan; and to assess the implications of these intergovernmental factors for implementation of the Plan. New proposals and developments include elaboration of the northern phase of the conveyance system, and the determination that conveyance of water for irrigation uses cannot be justified by economic criteria for federal water projects. Inter-state aspects include legal ramifications of four interstate compacts, and problems of coordinating planning efforts with neighboring states. Federal-state relations were considered in the context of court decisions in Arizona v. California and California v. United States; the U.S. Water Resources Council's major planning objectives; the High Plains Project of the Economic Development Administration; and the requirements of the National Environmental Policy Act of 1969. The impossibility of planning instate water development apart from a regional and inter-governmental context is stressed.

ENVIRONMENTAL IMPROVEMENT THROUGH ECONOMIC INCENTIVES,
Resources for the Future, Inc., Washington, DC.
F. R. Anderson, A. V. Kneese, P. D. Reed, R. B.

Stevenson, and S. Taylor.
Johns Hopkins University Press, Baltimore. 1977. 196 p.

Descriptors: *Pollution, *Pollution control, *Pollution taxes(Charges), *Pollution abatement, *Political aspects, *Economic justification, *Resources, Water pollution control, Pricing, Social aspects, Policy, Management, Economics, Equity, Costs, Cost-benefit analysis, Water pollution, Legal aspects, Natural resources.

The use of money charges to discourage environmental harm is addressed and the economic, technical, legal and political problems which need to be resolved in order to implement charge plans is discussed. Because common property resources such as air and water have not been quantitatively valued, they are treated as 'free goods' and are subject to extreme abuse by economic forces. In implementing charges, all of the complex social costs incurred by an activity should be considered. Charges and direct regulation are compared; charges are seen to be more cost effective than direct regulatory approaches. An economic rationale for charges is presented, explaining how the market system should work to allocate resources, why it does not work for environmental resources, and how and why charges would remedy the problem. Results are presented of surveys of environmental quality management schemes which employ the charges concept. Water pollution and water quality control charges include effluent charges, charges to finance collective control measures, and charges in conjunction with effluent standards. An effluent charge system in use in Czechoslovakia for 10 years is described. Monitoring systems for water and air pollution pose problems. Several basic approaches for measuring discharges are presented. Means of implementing charges through legislation and legal constraints are discussed, as well as political and institutional constraints. Any charge plan must be well designed, and must be politically feasible. Charges have sufficient potential advantage over alternatives to justify implementation. Pollution charges have advantages of administrative and economic efficiency as well as equity and should be pursued in the political arena. (Arnold-NC)

RESERVED WATER RIGHTS AND OUR NATIONAL FORESTS,
H. T. Brooks.
Natural Resources Journal, Vol 19, No 2, p 433-443, April 1979.

Descriptors: *Winters Doctrine, *Water law, *National forests, *Gila National Forest(NM), *Court decisions, Reserved lands, New Mexico, Timber, Water rights, Legal aspects, Federal-state water rights conflicts, Legal review, Judicial decisions.

The case of United States vs New Mexico (1978) is the most recent modification by the Supreme Court of the 'Winters Doctrine,' which provides that federally reserved lands have sufficient accompanying water rights to accomplish the purpose for which the lands were reserved. This case clarified the doctrine by holding that the Gila National Forest in southwest New Mexico has reserved water rights only for the primary purposes for which it was established, but not for any secondary purposes. The primary purposes recognized by the Court for National forests are furnishing a continuous supply of timber and securing favorable water flows. The history of the Winters Doctrine dates back to the 1899 case U.S. vs Rio Grande Dam and Irrigation Company but the first real articulation of the doctrine came in its namesake, Winters vs. U.S. in 1908. The doctrine was extended through numerous subsequent cases. The effects of the most recent case have been to reduce the quantity of reserved rights which may be claimed by the federal government for national forests, and to establish that water for other primary purposes must be obtained by the U.S. from the state or through the power of eminent domain. Also, all future permittees of the national forests will be required to adjudicate their rights according to state law. Finally, this decision may be indicative of a new attitude toward the Winters Doctrine as it applies to national forests. (Iervolino-NC)

A SYSTEMS RESOURCES APPROACH TO CITIZEN PARTICIPATION: THE CASE OF THE CORPS OF ENGINEERS,
North Carolina State Univ. at Raleigh. Dept. of Political Science.
T. D. Edgmon.
Water Resources Bulletin, Vol 15, No 5, p 1341-1352, October 1979. 29 Ref.

Descriptors: *Citizen participation, *Water resources, *Planning, *Corps of Engineers Urban Studies, *Decision making, *Administrative decisions, Administration, Institutions, Management, Project planning, Political aspects, Atlanta(GA), Albuquerque(NM), Pittsburgh-Wheeling(PA).

Citizen participation is identified as a process for decentralizing administrative decisions, making agencies 'responsive' to grass roots or local needs and values. But while citizen participation has the potential to facilitate an alteration in administrative decisions, it is not sufficient in itself to affect this change. Alterations in administrative decisions require the alteration of agency goals. The goal process is the product of coalition formation and bargaining. Therefore, citizen participation is effective only if it allows for the participation of organized groups with linkages to policy areas where other resources necessary for the maintenance of the organization are allocated. In the Corps of Engineers Urban Studies Program guidelines defined a citizen participation process going beyond the traditional public hearings format; procedures were to be established for developing public interaction in the planning process. This planning process was observed in three Corps districts: Atlanta, Pittsburgh-Wheeling, and Albuquerque. In Atlanta, substantive citizen-initiated issues find a way into the planning process, while in the other two study areas they do not. These outcomes can be attributed to Corps organization and the regional institutional environment of each of the districts. The study of these three districts illustrates the necessity of the citizen participation approach which assumes that in order to be able to exercise influence in goal setting, a group must be able to influence the flow of resources into the organization. COASTAL STATES HAVE CONTROL OF COASTAL RESOURCES,
C. G. Lackmann.
Natural Resources Journal, Vol 19, No 2, p 393-397, April 1979.

Descriptors: *Coastal resources, *Water rights, *Channel Islands National Monument(CA), *Beds, *Legal aspects, *Court decisions, California, Submerged Lands Act of 1953, Paramount rights, Coasts, Islands, Continental Shelf, Legislation, Judicial decisions, Water.

A recent decision in the U.S. Supreme Court, United States vs. California (1978), held that the economically valuable waters and submerged lands within one mile of the Channel Islands National Monument belong to California, not the federal government. This holding will have a major impact on the coastal industry around the United States. The Channel Islands National Monument consists of most of the Santa Barbara and Anacapa Islands located west of Los Angeles and lying between Santa Cruz Island and Santa Catalina. The Court's reasoning was based on the Submerged Lands Act of 1953 which gives the states ownership and control of all coastal lands and waters claimed by the federal government under the doctrine of paramount rights. The particul lands and waters in question possess substant economic value. Actions by California to attem to lease these lands for oil, gas and mineral exp ration led to the case. The instant case involv commercial harvesting of giant kelp, Macrocyst The decision in this case indicates a policy esta lished by Congress and enforced by the Court placing highly valued coastal resources under co trol of the states. COORDINATING LAND AND WATER US PLANNING FOR SOUND RESOURCE MA AGEMENT,
Florida Univ., Gainesville.
F. E. Maloney.
Water Supply and Management, Vol 2, No 3, 253-263, 1978.

Descriptors: *Land use, *Land managemen *Water pollution control, *Water, *Federal Wat Pollution Control Act of 1972, *Planning, *Wat resources planning, Pollutants, Effluents, Sewag treatment facilities, Florida, Wat management(Administrative), Water qualit Water use, Water resources, Legislation.

Land use planning and management is the onl cost-effective means for controlling pollutants an should be coordinated for regulatory efficiency The Federal Water Pollution Control Ac (FWPCA) Amendments of 1972 established thre water pollution control programs: (1) Nationa Pollutant Discharge Elimination Syste (NPDES); (2) a system of grants for funding wast water treatment facilities; and (3) a complex syste of three interrelated planning programs. NPDES designed to impose effluent standards and limita tions by requiring permits for the discharge of a pollutants from point sources into navigabl waters. The second program of grants is an at tempt to aid municipalities in meeting the standard set for sewage treatment. The three interrelate planning programs include funding of municipa treatment facilities under Section 201 of the Act basin planning under Section 303(e); and Sectio 208 areawide waste treatment plans. In Florid land and water use planning depend on essentiall separate regulatory systems. Land development i regulated by a combination of the Environmenta Land and Water Management Act and loca zoning regulations. Water is managed by the re gional water management districts establishe under the 1972 Florida Water Resources Act These two systems are intended to complemen one another but there are serious inefficiencie attributable to the lack of statutory consolidation (Iervolino-NC)

THE WATER GRID CONCEPT,
California State Dept. of Water Resources, Sacramento.
R. R. Reynolds.
Water Supply and Management, Vol 2, No 2, p 147-157, 1978.

Descriptors: *Water grid, *Water utilization, *Water resources development, *Water distribution, *Water management, Water supply, Water demand, Water supply development, Water delivery, Planning, Administration.

The phases in the history of water development are: (1) development of surface-water supplies; (2) development of groundwater supplies; (3) coordination of use of surface- and groundwater supplies; (4) water conveyance facilities; and (5) management of use of water. A water grid should have the following characteristics: (1) be a conveyance system; (2) have alternative sources and routes; (3) have interconnecting links; (4) have sufficient con-

veyance capacity to meet peak demands as they occur with some excess capacity; (5) be connected to, and convey water from, all sources including those under the various phases of the hydrologic cycle and those where water is made available by technological processes such as desalination; (6) operation of the facilities of the grid system could be coordinated and there could be an integrated management. The water grid would link the water sources to the areas of water demand. The most significant aspects are large interbasin and interregional aqueducts, and central coordination and management. Possible arrangements to give operational flexibility include exchange of water and capacity in reservoirs; exchange of water and capacity in aqueducts; power exchange; power and water banking; exchange of use of facilities; on-peak and off-peak operation of generation and pumping facilities; operation to maximize power production and operation to maximize water yield; controlled volume concept of aqueduct-operation; long-range forecasts; computer studies; and centralized operation control. IMPACT OF ENERGY DEVELOPMENT ON THE LAW OF THE COLORADO RIVER,
G. D. Weatherford, and G. C. Jacoby.
Natural Resources Journal, Vol 15, No 1, p 171-213, January 1975.

Descriptors: *Colorado River, *Water allocation(Policy), *Energy, *Water demand, Reclamation, Agriculture, Water rights, Water law, Resources development, Water quality, Environmental effects, Water supply.

Profound changes are now occurring in the Colorado River Basin. New societal demands for water are on a collision course with vested legal rights and past commitments. The exploitation of fossil fuels in the area poses great problems for the traditional paramount concerns of reclamation and agriculture. The 'law of the river' is actually a composite of many statutes, compacts, court decisions, contracts, regulations and administrative rulings. Generally speaking, the flow of the Colorado River is divided among users on the basis of beneficial consumptive use. The allocation system operates at four levels: international, interregional, interstate, and intrastate. Legal problems on the river are partially the function of changes in the ratio of water supply to water demand, with a rising water demand curve. The scale of dislocation and change expected over the coming decades can be handled by the legal system through water conservation and the acquisition or condemnation of water rights. Vested rights will be subject to increased regulation in order to effect needed changes. (Wilson-Florida)

IMPLICATIONS FOR THE FUTURE: DESIGN OF VIABLE INTERNATIONAL INSTITUTIONS,
Mexicano Inst. de Estudios Diplomaticos.
L. C. Sepulveda.
Natural Resources Journal, Vol 15, No 1, p 215-221, January 1975.

Descriptors: *International Boundary, *Water Commission, *Colorado River, *Boundary disputes, Treaties, Mexico, United States, Water rights, International commissions, Border iffigation, International Law, Water demand.

Upon approval by both governments, Minute 242 of the International Boundary and Water Commission of August 30, 1973, became an executive agreement which represents a satisfactory arrangement concerning the use of the waters of the Colorado River. This instrument reveals the possibility of reaching agreement in other conflicting areas which may arise between Mexico and the United States because of the waters of that river. The growing scarcity of waters throughout the course of the Colorado River, the constant increase of use of the upstream waters, the continuous absence of rains, and the overestimation of flow all indicate that a problem could arise between the two countries. The underground waters along the border may also be a problem in the future. Thus, adequate international institutions should be provided for the administration of discrepancies and for the avoidance of conflict. There exist between the United States and Mexico sufficient bilateral and multilateral instruments for the amicable adjustment of controversies, especially through arbitial means. Fundamental to a solution to disputes should be the International Boundary and Waters Commission. (Wilson-Florida)

THE MANAGEMENT OF INTERNATIONAL BOUNDARY WATERS OF CANADA AND THE UNITED STATES: A COMPARATIVE STUDY,
Cornell Univ., Ithaca, NY. Water Resources and Marine Sciences Center.
L. B. Dworsky.
Natural Resources Journal, Vol 15, No 1, p 223-227, January 1975.

Descriptors: *Boundary disputes, *International Joint Commission, *Great Lakes, Treaties, United States, Boundaries(Surfaces), Canada, International Law, Foreign countries, Navigable waters.

Canada and the United States share a continuous boundary 3,600 miles in length. Since the 1909 Boundary Water Treaty (Treaty), the International Joint Commission has been actively engaged in helping to resolve water related disputes. Some of these cases were readily amenable to solution; others, like the problems in the Columbia River Basin, were more complex; and many of the Great Lakes' problems have not yet been solved. Since 1909, no substantial review has been made of the International Joint Commission, nor has substantial consideration been given to improving the management of the Great Lakes. The Treaty gives the Commission responsibility in two general areas. The first area is the approval or disapproval of all proposals for use, obstruction, or diversion of boundary waters. The second responsibility is to investigate and make recommendations on specific problems referred to it by either government. It would appear to be very useful to consider the formation of another commission for the Mexican-United States boundary waters. (Wilson-Florida)

GUARDING THE TREASURES OF THE DEEP: THE DEEP SEABED HARD MINERAL RESOURCES ACT,
D. W. Proudfoot.
Harvard Journal on Legislation, Vol 10, No 4, p 596-620, June 1973.

Descriptors: *Law of the Sea, *Resources development, *Mineral industry, Regime, Conservation, Mining, International law, Treaties, Exploitation, Beds under water, International waters.

As a response to the need for clarification and development of maritime mineral resources law, the Oceans Policy Statement was promulgated by the Nixon Administration. Part of this statement calls for an interim regime which would allow continued seabed exploration and exploitation beyond the present limits of national jurisdiction, pending establishment of an international regime. In response to this oceans policy, the Deep Seabed Hard Mineral Resources Act (DSHMRA) was introduced, but never voted on. The problem of establishing an interim regime for hard minerals is addressed. Whether the DSHMRA is a proper response to this problem is assessed. International law has not kept abreast of the seabed's mineral potential. The United States is committed to developing deep seabed resources pursuant to an international regime. The mining industry's position is one of immediate mineral development. The Mineral Resources Act (MRA) is their proposal which would establish a mandatory system of first-come-first-served licensing for hard mineral mining. The MRA accomplishes none of the objectives that a proper response to the problem should, but, if adopted in modified form, it would be a useful instrument of national policy. (Daniels-Florida)

COASTAL CONTROLS IN CALIFORNIA: WAVE OF THE FUTURE,
R. C. Breeden.
Harvard Journal on Legislation, Vol 11, No 3, p 463-508, 1974.

Descriptors: *California, *Coasts, *Shore protection, Legislation, Permits, Regulations, Programs, Project planning, Management, Protection, Environmental control.

In response to a perceived manmade threat to the natural characteristics of the California coastal zone, a citizen-sponsored coastal initiative, the 1972 California Coastal Zone Conservation Act (Act) was enacted. The Act has three basic objectives: (1) to establish a policy of coastal protection and environmental concern; (2) to create interim controls on development through a permit system; and (3) study the needs of the coastal zone and recommend a plan for long-term management of the coast within 4 years. The Act's provisions are analyzed; the results of its operation during the first 16 months are examined; and its legal implications are considered. Briefly examined are the unique power, duties, membership requirements and responsabilities of the enforcement commissions. The permit control system is very important in the short-run. Early problems have been encountered, most significantly the enormous backlog of permit applications. Instances of permit denials and conditional grants are examined. The planning process in operation is examined. While some success has been achieved, long-run coastal control will fail, if the immediate pressures of permit regulation divert the commissioners from designing the best possible plan. (Daniels-Florida)
W80-04779

INTERNATIONAL LAW AND MARITIME JURISDICTION IN RELATION TO SEA RESOURCES: THE CASE OF FISHING IN PERU,
R. J. Payne.
Howard Law Journal, Vol 18, No 2, p 361-384, 1974.

Descriptors: *Fisheries, *Jurisdiction, *Law of the sea, Resources, Resource development, International law, Technology, Economic justification, Fishing, Exploitation.

Advanced technical knowledge enables man to explore and develop what once was beyond his imagination. These advances affect law and relations, and call for revisions and adjustments in international law. With advanced technology, a new emphasis is placed on the ocean as a food source. This challenges traditional territorial water limitations, such as the three-mile limit, and cooperation in exploiting marine resources, especially fisheries. Nations lacking this technology, especially Peru, are unable to compete with technologically advanced nations for fisheries resources, which are essential to their development. The relation of fisheries to territorial waters and maritime jurisdiction is examined. Fishing has always played a major role in the economic welfare of many maritime states, especially Peru. Peru's claim to a 200-mile jurisdictional zone can be seen as a necessary action to prevent uncontrolled exploitation of fish by technologically advanced nations. Economic conditions within countries determines the nature and content of international law to a large extent. International law must suit present conditions. The three-mile limit grew out of circumstances no longer prevailing. (Daniels-Florida)
W80-04780

ENFORCING THE FEDERAL WATER RESOURCE SERVITUDE ON SUBMERGED AND RIPARIAN LANDS,
B. H. Johnson.
Duke Law Journal, Vol 1977, No 3, p 347-388, May 1977.

Descriptors: *Federal Water Pollution Control Act, *Rivers and harbors act, *Riparian land, *Easements, Regulation, Water resources, Administrative agencies, Public access, Legislation, Regulation, Navigable waters, Public rights.

Congress has customarily substantiated public water resource rights by enacting federal restrictions on private activities in or around waters and adjacent wetlands. Enforcement of federal controls is difficult and complex because of a wide variety of geographical settings, policy considerations, equities and public interests. Past enforcement efforts were on an ad hoc basis. Recent developments show a move toward programmatic approaches to enforcement. Current developments in the federal enforcement effort are examined. Congressional restrictions imposed on owners of submerged and riparian lands by the 1899 Rivers and Harbors Appropriation Act and the 1972 Federal Water Pollution Control Act Amendments are generally discussed. These acts effectively burden submerged and riparian lands with a federal water resource servitude. Administrative enforcement efforts, including cease-and-desist orders, self-help remedies, and judicial enforcement efforts, allowing for civil and criminal penalties and injunctions, are explored. While a broad range of remedial measures are at the federal government's disposal, the complexity of the enforcement task requires additional remedies. Enforcement should begin with the administrative process, and agencies should be provided with necessary remedial measures. (Daniels-Florida)

MUSING ON THE BOTTOM: ECONOMIC AND LEGAL IMPLICATIONS OF THE UNITED STATES' PROPOSED DRAFT UNITED NATIONS CONVENTION ON THE INTERNATIONAL SEABED,
Lewis and Clark Coll., Portland, OR.
E. J. Brunet.
University of Illinois Law Forum, Vol 1974, No 2, p 251-284, 1974.

Descriptors: *Beds under water, *Law of the sea, *Resources development, Legal aspects, Economic impact, International waters, Oceans, Resources, Mineral industry, United Nations, International commissions.

No legal norms governing use of the ocean's seabed exist. There is an immediate need for consideration of institutional arrangements to control marine resource exploitation. On May 23, 1970, President Nixon announced a revolutionary ocean seabed policy for the United States (U.S.) that was subsequently submitted to the United Nations (U.N.). This proposal would provide the legal structure governing almost three-quarters of the earth's area, with corresponding monumental political and economic significance. The core of the U.S. proposed convention is its novel ownership provision. The International Seabed Area would be open to use by all states, considered the common heritage of mankind. The proposal creates an international political entity and U.N. affiliate, the International Seabed Authority, to govern ocean seabeds. An exploitation license, granted by the Seabed Authority, would be a prerequisite to seabed mining. An analysis of the U.S. proposal identifies certain inherent inefficiencies. (Wilson-Florida)
W80-04782

FEDERAL ENVIRONMENTAL LITIGATION IN 1976: THE FEDERAL WATER POLLUTION CONTROL ACT,
K. M. Hunciker, and V. Pagano, Jr.
Harvard Environmental Law Review, Vol 1, p 59-101, 1976.

Descriptors: *Waste water treatment, *Federal water pollution control act, *Water quality standards, Judicial decisions, Legal aspects, Federal government, Effluents, Legislation, Administrative agencies, Industrial wastes, Environmental control.

The 1972 Federal Water Pollution Control Act Amendments (Act) are a crucial element in the nation's battle against pollution. The most important litigation under the 1972 Amendments resulted from industry challenges to the federal Environmental Protection Agency's (EPA) promulgation of effluent limitation regulations for industrial wastewater discharges. The affected industries challenged EPA's authority under the Act on several grounds: (1) the issuance of binding effluent limitations; (2) the procedures under which these limitations are to be imposed; and (3) the merits of the specific pollutant limits themselves. A major requirement of the Act is that uniform effluent limitations be achieved for all industrial point sources by July 1, 1977, and July 1, 1983, based on the technology required. Delays in issuing standards, granting permits, and in judicial review of regulations have ensured that the 1977 deadline will not be met. Section 509(b)(1) provides for judicial review of the promulgated effluent limitations. Court challenges have become a major time barrier to attaining the 1977 and 1983 deadlines. (Wilson-Florida)

THE COASTAL ZONE MANAGEMENT ACT AMENDMENTS OF 1976,
A. C. Yahner.
Harvard Environmental Law Review, Vol 1, p 259-288, 1976.

Descriptors: *Coasts, *Shore protection, *Energy, Programs, Legislation, Federal government, Research and development, Development, State governments, Public access, Planning.

In enacting the 1976 Coastal Zone Management Act Amendments (Amendments) Congress sought to expand the Act to compensate for the effects of energy facilities on coastal areas. The Amendments establish a 1.2 billion-dollar program to aid the states in planning the location of specific facilities, in financing public projects such as schools and roads necessitated by these facilities, and in ameliorating environmental losses. The Amendments also expand the original planning program by requiring three new planning elements dealing with beach access, coastal erosion and energy facilities siting. In addition, three new funding programs are established to provide money for interstate coordinated activities, for research and technical assistance, and for acquiring access to shorefront areas. The Amendments establish a Coastal Energy Impact Fund to provide grants, loans, and guarantees for states to plan for and mitigate the impacts of new coastal energy activities. The Amendments also raise a number of questions concerning their effect on the original Act. (Wilson-Florida)

IMAGES AND MODELS IN THE WORLD COURT: THE INDIVIDUAL OPINIONS IN THE NORTH SEA CONTINENTAL SHELF CASES,
Sheffield Univ. (England).
J. G. Merrills.
The Modern Law Review, Vol 41, No 6, p 638-659, November 1978.

Descriptors: *Continental Shelf, *International waters, *Law of the sea, International commissions, International law, Governments, Governmental interrelations, Water law, Law enforcement, Judicial decisions.

The individual opinions in the North Sea Continental Shelf cases are examined for evidence of so-called 'images' and 'models' of international law. The cases arose out of a dispute between Denmark and the Netherlands on one side and the Federal Republic of Germany on the other, relating to the delimitation of their respective areas of the North Sea Continental Shelf. These cases decided there was no single method of delimitation obligatory in all circumstances. Delimitation was to be effected by equitable agreement. The individual opinions are discussed in considerable detail. The significance of images and models is analyzed. Images are viewed as 'conceptions of concrete situations lurking behind proposals for solutions to general problems'. Models are seen as 'the mental constructs of the world we employ to organize our thinking about international law.' Applied to the individual opinions, the different models and images are viewed as the reason for the gulf dividing contemporary theories of international law. (Tabano-Florida)
W80-04785

CURRENT ENVIRONMENTAL LAW: TAKING OR REGULATION,
R. L. Bisso.
Loyola Law Review, Vol 24, No 4, p 649-677, Fall 1978.

Descriptors: *Land use, *Coastal plains, *Shore protection, Economics, Environmental effects, Ecology, Compensation, Constitutional law, Environment, Eminent domain, Environmental control.

A conflict exists today between the pressures of economic land exploitation and the pressure to maintain environmental quality through land use legislation. The taking issue is discussed in light of recent coastal and shoreline protection regulation. The current state of the taking issue is reviewed, beginning with Pennsylvania Coal v. Mahon, and following through to the recent Penn Central Transportation Company v. City of New York. The constitutional elements of the taking issue are discussed, emphasizing the distinction between eminent domain and the police power. The regulatory trend has shifted now from an emphasis on economic values to ecological, social and aesthetic ones, and this switch is reviewed through an analysis of the 1972 Federal Coastal Zone Management Act, the Marinette County, Wisconsin Shoreline Zoning Ordinance, and the New Orleans Coastal Zone Management Plan. Three alternative solutions to environmental control are offered: (1) restrictive height, bulk and area requirements; (2) transfer of development rights; and (3) in lien payments. Legislation recognizing the difference between eminent domain and the police power could solve the problem. (Tabano-Florida)

EMERGING TRENDS IN THE USE OF INTERNATIONAL LAW AND INSTITUTIONS FOR THE MANAGEMENT OF INTERNATIONAL WATER RESOURCES,
Denver Univ., CO.
V. P. Nanda.
The Denver Journal of International Law and Policy, Vol 6, Special Issue, p 239-261, 1976. 1 Fig.

Descriptors: *Water quality, *Water resources development, *International waters, *International law, United Nations, Water law, Water resources, Water management(Applied), Water quality control, Water sources, International commissions, Governmental interrelations.

In a recent conference, the United Nations concluded that a potential world water crisis exists. Although there appears to be sufficient water, it tends to be available in the wrong place or with the wrong quality. International law and institutions can facilitate the management of international river resources, primarily for non-navigational uses. Unilateral attempts to solve water problems are often limited, since many nations lack adequate data and skill to develop water systems with likely wasteful duplication of effort. Concerted effort is especially necessary for internationally interconnected water resources. General conventions of nations have been held to adopt treaties and statutes. There have also been multilateral, regional, and bilateral conventions, accounting for some 300 agreements between and among states. A large number of intergovernmental organizations have also been actively involved with water resource problems. Scholarly and professional organizations have contributed studies of international watercourses. Emphasis should be taken off sovereignty when dealing with the uses of international waters, and placed upon the interests of the international community as a whole. (Tabano-Florida)

The North Carolina Law Review, Vol 53, No 2, p 275-302, December 1974.

Descriptors: *Coastal plains, *Coastal structures, *Land use, *Shore protection, Resources, Admin-

istrative agencies, Water utilization, Permits, Governmental interrelations, Management, Environmental controls, *North Carolina.

In 1974, North Carolina passed the Coastal Area Management Act (Act), initiating a comprehensive program for the management of the land and water resources in its coastal zone. Its major objectives are an instrumental use of law rather than a mere technical statement, and the delegation of substantial discretionary powers to administrative agencies and local government units. Although the process of policy formulation was influenced by federal developments, such as the 1972 Coastal Zone Management Act, the state's law has proceeded independently from the federal effort. The area covered by the Act is extremely broad. The Act institutes comprehensive land and water use planning for the coastal area. Certain lands and waters are designated areas of environmental concern in which no development may be undertaken without a permit. Variances are allowed upon a showing of unnecessary hardship, and certain exemptions and exclusions are allowed. Two procedures for judicial review are available, and public participation in decision-making is required. The local character of the administrative agency, the lack of legal requirements to assure planning implementation, and the exemptions given could subvert the Act's intended operation. ONCE-RELEASED IRRIGATION WATERS: LIABILITY AND LITIGATION,
H. Meshorer.
Montana Law Review, Vol 36, No 1, p 14-28, Winter 1975.

Descriptors: *Irrigation effects, *Drainage water, *Seepage control, *Remedies, Legislation, Federal jurisdiction, Judicial decisions, Irrigation engineering, Reclamation, Legal aspects, Irrigation, Water law.

There has been an inevitable outgrowth of the widespread use of irrigation in the western United States. This is litigation regarding damage caused by seepage or drainage of excess waters from government reclamation projects onto adjoining lands. The problems remain unavoidable because of the basic engineering or irrigation, and unsettled due to the relative lack of case law on the subject. Problems are further complicated by the various notions of ownership and resultant liabilities. The most commonly used remedy for the injured landowner is the Federal Tort Claims Act. As an adjunct to tort liability, the doctrine of res ipsa loquitur may be applied. Liability apart from negligence may still exist in the form of the constitutional claim of a taking of property for a public use without just compensation. The remedies available to the landowner whose property is damaged by seeping waters are plainly inadequate. One alternative might be a decision to recognize a form of absolute liability. (Wilson-Florida)

THE ENFORCEMENT OF FEDERAL RECLAMATION LAW IN THE WESTLANDS WATER DISTRICT: A BROKEN PROMISE,
M. L. Frampton.
University of California, Davis, Law Review, Vol 13, No 1, p 89-121, Winter 1979-80.

Descriptors: *Federal reclamation law, *Federal project policy, *Water districts, *California, Reclamation, Agriculture, Irrigation water, Legal aspects, Federal government, Administrative agencies, Water allocation(Policy).

In California's San Joaquin Valley lie more than a half-million acres of rich agricultural land. This ground is made bountiful by irrigation water from the federally constructed San Luis Unit of the Central Valley Project. One consideration for procuring water subsidies from the federal government is the landowners' continuing compliance with federal reclamation statutes. These statutes limit the amount of water an individual may obtain, and require recipients to live on or near their farmland. The purposes of the reclamation law have been continually thwarted in the Westlands Water District. This District supports a mere 216 large farm operations. Small farmers have been frustrated in their attempts to purchase land in the Westlands Water District. Small farmers have challenged the federal administration of reclamation law. Groups have sought injunctions to prevent further excess land sales, pending promulgation of regulations regarding such approvals. However, without a meaningful lottery provision or a realistic residency figure, the new rules would not prevent large group transactions and insider deals that exclude the average family farmer. (Wilson-Florida)

SOIL CONSERVATION AND WATER POLLUTION CONTROL: THE MUDDY RECORD OF THE UNITED STATES DEPARTMENT OF AGRICULTURE,
Nebraska Univ., Omaha.
C. L. Williams.
Boston College Environmental Affairs Law Review, Vol 7, No 3, p 365-421, 1979.

Descriptors: *Soil conservation, *Soil erosion, *Water pollution control, *Agricultural runoff, Land use, Agriculture, Federal water pollution control act, Water quality, Administrative agencies, Federal government, Water pollution sources.

Under provisions of Section 208 of the 1972 Federal Water Pollution Control Act Amendments, every state must submit a Water Quality Management Plan. This Plan covers so-called non-designated areas within the state, which must be approved by the federal Environmental Protection Agency (EPA). Since the vast majority of agricultural land in the United States lies in these non-designated areas, virtually all agricultural land may potentially become subject to federally mandated water pollution regulations. There are serious efforts being made to have the administration of Section 208 removed from EPA, as it applies to agriculture, and placed instead in the Department of Agriculture (USDA). With a prominent role in the control of agricultural non-point source pollution virtually assured for the USDA, it is important to examine that agency's past performance regarding the limitation of soil erosion. The USDA's shortcomings in soil conservation have occurred in three areas: (1) program goals; (2) program content; and (3) program administration. Finally, difficulty arises from the nature of the erosion problem itself, for erosion control programs require a great deal of flexibility. (Wilson-Florida)

THE FEDERAL WATER POLLUTION CONTROL ACT - INDUSTRIAL CHALLENGES TO EFFLUENT LIMITATIONS,
J. E. McKinnon.
Boston College Environmental Affairs Law Review, Vol 7, No 4, p 545-566, 1979.

Descriptors: *Federal Water Pollution Control Act, *Water quality standards, *Waste water(Pollution), Water pollution, Administrative decisions, Effluents, Administrative agencies, Legal aspects, Regulation, Decision making, Discharge(Water).

Under the 1972 Federal Water Pollution Control Act Amendments (Act) every industry that discharges waste water must meet effluent limitations promulgated by the federal Environmental Protection Agency (EPA). This mandate has spawned legal challenges to effluent limitations. The different types of industrial challenges to effluent limitations are described. The three main categories of challenges are procedural, statutory and substantive. Procedural challenges concern the EPA's failure to satisfy fair notice requirements. Statutory challenges involve attacks on the EPA's interpretation of the Act. Substantive challenges concern the EPA's judgment in developing effluent limitations. The legal standards that these effluent limitations must meet in order to withstand such judicial challenges are outlined. Strict enforcement of the fair notice requirement is the best way to ensure fair regulation and decrease procedural challenges. Substantive challenges may be expected to make up the bulk of future challenges. If the EPA can show, through the administrative record, that adequate consideration was given to all relevant factors and that it has noted on correct data in setting effluent limitations, these challenges will likely fail. (Daniels-Florida)

THE OUTER CONTINENTAL SHELF LANDS ACT AMENDMENTS OF 1978: BALANCING ENERGY NEEDS WITH ENVIRONMENTAL CONCERNS,
G. L. James.
Louisiana Law Review, Vol 40, No 1, p 177-206, Fall 1979.

Descriptors: *Continental shelf, *Oil fields, *Oil pollution, *Resources development, Gasoline, Oil, Environment, Leases, Sites, Governmental interrelations, Oil spills, Management, Drilling.

In 1977 Congress amended the Outer Continental Shelf Lands Act (Act) in order to expedite the development and production of continental shelf oil and gas, and to provide adequate protection to the coastal environment. This comment addresses these amendments by first presenting the Act's background and other major federal regulatory legislation are discussed. The amendments are discussed as they relate to three different stages of the leasing process. Stage one, site selection, deals with different factors involved in the selection process. Exploration and development is also mentioned, with a review of state and local government participation in the program. Stage two, management, covers the suspension and cancellation of leases, air emission standards, and improvement of drilling technology. The third stage, enforcement, reviews the role of the federal agencies, liability, and damages recovery in the event of an oil spill. A balance between the need for future energy supplies and the importance of environmental protection must be struck in order that the United States may depend less on foreign oil sources and yet preserve its aesthetic quality. (Tabano-Florida)

NEED FOR A UNIFORM PUBLIC - PRIVATE BOUNDARY: APPLICATION OF THE HIGH WATER BOUNDARY TO INLAND NAVIGABLE LAKES,
K. S. Beaumont, and L. Libby-Nelson.
University of California, Davis, Law Review, Vol 12, No 1, p 125-164, March 1979.

Descriptors: *Boundaries(Property), *Boundary disputes, *High water mark, *Navigable waters, Riparian land, Riparian rights, Compensation, Water injury, Water law, Water level fluctuations, Flooding, Submergence.

Private riparian owners and the state of California are currently arguing over the boundary line separating state from private ownership on navigable lakes. The state asserts title to the high water mark while the private owners claim to the low water mark. A resolution of the public-private boundary conflict in California's navigable lakes is proposed. The ordinary high water line is asserted as the true boundary. The background and use of this line is thoroughly discussed. Explicit adoption of a high water boundary would not result in a compensable taking of private property. Artificial regulation of the water level in relation to the boundary question is also discussed. It is felt that the boundary should follow the new high water mark, even though the state has caused the increase. The issue of whether the state should compensate owners for riparian land which becomes submerged or flooded due to state action is also considered. (Tabano-Florida)

WRECK REMOVAL; STATUTORY RESTRICTIONS; RIVERS AND HARBORS ACT,
A. J. Blank, Jr.
Tulane Law Review, Vol 53, No 4, p 1299-1327, June 1979.

Descriptors: *Rivers and Harbors Act, *Coast guard regulations, *Water pollution control, Judi-

cial decisions, Legislation, Ships, Remedies, Federal government, Watercourses(Legal aspects), Navigation, *Shipwreck removal.

Although the present federal Wreck Statute governing wreck removal has been in existence since 1899, the first significant analysis of it by the Supreme Court did not occur until 1967 in Wyondotte Transportation Co. v. United States. Recent court decisions have been in favor of the rights and remedies of the government against both the negligent wreck owner, the negligent non-owner who caused or contributed to the wreck sinking. Although the Wreck Act (Act) is not a model of clarity, it is evident that none of its sections include any personal remedies; rather they include only property remedies. Section 15 of the Act has been construed to place on the owner of a wreck, whether negligent or not, a continuous duty to locate and mark his wreck. An element of uncertainty has existed as to when and if owners were relieved of this duty by the intervention of the Coast Guard. The condemnation in the Wyandotte case of negligent parties, and its rejection of their right of abandonment, exposes such parties to unlimited personal liability for removal costs. (Wilson-Florida)

FEDERAL PROTECTION OF WETLANDS THROUGH LEGAL PROCESS,
C. B. Myhrum.
Boston College Environmental Affairs Law Review, Vol 7, No 4, p 567-627, 1979.

Descriptors: *Wetlands, *Federal Water Pollution Control Act, *Water quality control, Environmental control, Regulation, Legislation, State governments, Navigable waters, Rivers and Harbors act, Environment, Federal government.

Wetland protection is viewed as a vitally important priority in the effort to restore and maintain water quality and preserve natural hydrologic cycles. The problem of arriving at an exact definition of wetlands and their importance in the ecosystem are discussed. An analysis of certain state regulatory efforts shows the shortcomings of state pollution control strategies and the necessity for federal regulation in this area. A historical perspective covers the term 'navigable waters' and the 1899 Rivers and Harbors Act. The enactment of Section 404 of the Federal Water Pollution Control Act is discussed emphasizing statutory drafting mistakes that caused a dispute between the Environmental Protection Agency and the Army Corps of Engineers. The resulting litigation brought about an expansion of Section 404. The elements of this new program especially significant to wetland protection is discussed. The Congressional activity involved in the evolution of Section 404 is examined with emphasis on its expansive revisions. This growing awareness of the value of wetlands will aid in maintaining an ecologically balanced environment. (Tabano-Florida)

THE MUNICIPAL PROGRAM OF THE CLEAN WATER ACT: 1978 ADMINISTRATIVE IMPLEMENTATION,
T. S. James, Jr.
The Harvard Environmental Law Review, Vol 3, p 326-346, 1979.

Descriptors: *Municipal wastes, *Construction costs, *Treatment facilities, Grants, Discharge(Water), Federal government, Public utilities, Treatment, Governmental interrelations, Cost analysis, Technology.

In 1978, the federal Environmental Protection Agency (EPA) promulgated regulations to implement the 1977 Clean Water Act (Act). These regulations embody important insights gained from the EPA's evaluation of the municipal program. The program goals were changed to extend the statutory deadline for all municipal point sources and to provide an exception for discharges into marine waters. The Construction Grants Program, which provides federal assistance for construction of publicly-owned treatment works, also underwent changes. Responsibilities were decentralized from the EPA to the states and local governments. The categories of eligible construction costs were expanded. Special Funding Programs were implemented, providing grants for innovative and alternative technology. Cost-Effectiveness Analysis Guidelines and Reserve Capacity Regulations were promulgated to promote efficiency. Combined grants were also made available to certain communities for preparing construction plans and specifications and for building the treatment works. All of these changes promote a balance of the Act's varied objectives. (Tabano-Florida)

REPORT TO GOVERNOR JOHN A. LOVE ON CERTAIN COLORADO WATER LAW PROBLEMS,
Holland and Hart, Denver, CO.
J. U. Carlson.
Denver Law Journal, Vol 50, No 3, p 293-350, 1973.

Descriptors: *Colorado, *Prior appropriation, *Water allocation(Policy), *Water demand, Diversion, Environmental effects, Water law, Water rights, Water resources development, State government, Legal aspects, Water management(Applied).

In a semi-arid state like Colorado, the importance of water and its uses are obvious. As this resource approaches full utilization, concern that social and environmental values be protected becomes paramount. The resolution of these concerns is complicated by a system of water law rooted in the state constitution. The doctrine of prior appropriation was law in Colorado before statehood, and the constitution of 1876 confirmed prior appropriation as the state's fundamental water law. In the early development of prior appropriation law, it was clear that a judicial decree did not create the water right; the right was created by diversion of water and its application to beneficial use. The increasing demand for water and the scarcity of further unappropriated waters point to increasing market pressure on existing, decreed rights. The doctrine of prior appropriation contemplates the full use of all the state's water. The favored uses are traditional consumptions for economic development. Full consumptive use may serve goals of economic development at the expense of scenic, aesthetic and environmental values. (Wilson-Florida)

VESSEL-SOURCE OIL POLLUTION: LEGAL, ADMINISTRATIVE AND TECHNICAL ASPECTS OF A GLOBAL ENVIRONMENTAL PROBLEM,
R. A. Kriscunas.
Comparative Law Yearbook, Vol 2, p 237-284, 1978.

Descriptors: *International waters, *Oil spills, *Oceans, *International Boundary and Water Commission, International law, Water pollution, Oil pollution, International commissions, Legal aspects, Marine biology, Environmental effects, Environmental control.

The reader is given an understanding of the legitimate ecological issues raised by the maritime transportation of oil. An up-to-date explanation is provided of the control measures being utilized by the international community to curtail vessel-source oil pollution. The various national and regional approaches to this essentially 'extraterritorial' pollution phenomena are surveyed. Examined in detail are a variety of proposals for improving the development and enforcement of international and national standards for the prevention of vessel-source pollution. Included are the 1974 Baltic Convention, the Third United Nations Conference on the Law of the Sea, the 1973 Marine Pollution Convention, and others. Individual states lack standing to complain about all but a minimal number of water-based and land-based pollution activities. Furthermore, shipowner or even cargo-owner liability is not a deterrent to pollution. There is a need for a comprehensive ocean protection constitution. Essential elements for a proposal in the immediate future are suggested. (Schwerer-Florida)

PREVENTING GROUNDWATER POLLUTION: TOWARDS A COORDINATED STRATEGY TO PROTECT CRITICAL RECHARGE ZONES,
Environmental Defense Fund, Inc., Washington, DC.
J. T. B. Tripp, and A. B. Jaffe.
The Harvard Environmental Law Review, Vol 3, p 1-47, 1979.

Descriptors: *Groundwater, *Pollution abatement, *Groundwater recharge, Federal government, Federal Water Pollution Control Act, Water pollution, Water management(Applied), Legislation, Legal aspects, Water supply.

To be effective, groundwater management requires coordinated action by all levels of government and a broad arsenal of legal tools, including regulation of land use. The nature of groundwater and groundwater pollution, and the legal framework upon which control must be based are examined. Federal, state, and local legislation is analyzed, including four case studies utilizing programs based on non-degradation and recharge zone protection. The case studies illustrate both the possibilities and the difficulties of implementing such an approach. Although specific problems of assuring adequate water quantity are not addressed, the problems of pollution control measures aggravating depletion and depletion control measures worsening pollution are examined. An overall management approach to groundwater pollution is suggested, with primary responsibility for groundwater protection in the states and localities. This is based on the apparent confusion in federal programs, and the ineffectiveness of regulation under the Safe Drinking Water Act and other federally administered programs. The ineffectiveness of federal programs regulating groundwater pollution is analyzed. Possible amendments and proposals are suggested. (Schwerer-Florida)

ESTIMATING COSTS AND BENEFITS FOR NONSTRUCTURAL FLOOD CONTROL MEASURES,
Hydrologic Engineering Center, Davis, CA.
W. D. Carson.
October 1975. 115 p, 7 Fig, 18 Tab, 40 Ref.

Descriptors: *Flood control, *Floodproofing, *Non-structural alternatives, *Regulation, *Relocation, *Land use, *Cost-benefit analysis, *Evaluation, Flood protection, Flood plain zoning, Zoning, Building codes, Benefits, Project benefits, Project planning, Computer models, Computer program, Linear programming, Flood damage, Damages.

This report evaluates three nonstructural flood control measures: flood-proofing, evacuation-relocation and land use regulations. Floodproofing is an adjustment to a structure or its contents, or both, such that either water is kept from the structure or the damaging effects of water entry are

inated or reduced. Evacuation-relocation in-
ves the physical and permanent evacuation of
vities and people from the floodplain to sites
ere the flood hazard is lower. Land use regula-
attempts to direct future land use in such a
that it is consistent with the flood hazard.
imates of the cost of floodproofing would be
le by examining different designs for each
ucture and choosing the least expensive to add
the total cost. Two distinctive cost categories
be considered for evacuation-relocation: (1)
sical costs of carrying out the program, and (2)
of income occasioned by the relocation of the
ivity away from the location chosen in the
rket. The measurement of the costs of land use
ulation requires projection of future develop-
nt which will occur in the floodplain and deter-
ning what costs are incurred by excluding this
jected development from the floodplain. These
ee measures create inundation reduction benefits
lowering the damage susceptibility of individual
uctures or of the aggregate of structures on the
odplain. Intensification benefits occur when an
ivity is allowed, or induced, to intensify its
eration as a result of a flood control program.

his study was designed to investigate (1) vegeta-
ve factors influencing ring-necked pheasant (Pha-
anus colchicus) use of wetlands during the
inter, (2) the relationship of land use practices
djacent to wetlands and the use of such wetlands
winter cover by pheasants, and (3) the feasibility
assessing wetlands as pheasant winter habitat
rough the use of remote sensing data. Fifteen
etlands in Windsor Township, Brookings
ounty, South Dakota, were randomly selected
r study to estimate their use by pheasants. Use of
over types was analyzed by using multiple regres-
on, chi-square, and t-tests. Correlation matrices
ere generated to locate significant relationships.
heasant use of wetlands was analyzed using multi-
le regression. Height was the most important
egetative factor influencing loafing site selection.
hrubs were highly preferred over other cover
ypes for loafing. Trees, phragmites (Phragmites
ommunis), and cattails (Typha latifolia) were also
sed regularly. Smartweeds (Polygonum coccin-
um), roundstem bulrushes (Scirpus acutus and
cirpus validus), and grasses were seldom used.
Density was the most important vegetative factor
nfluencing selection of roots sites by pheasants.
Most roots were in cattails while phragmites had
he greatest relative number of roots. Size of wet-
and and the presence of emergency cover around the wetland were the most important factors influencing degree of pheasant use. Wetlands consistently used by pheasants were either large dense cattail wetlands or had considerable shrub growth. The small wetlands with no shrub growth filled with snow early and were not utilized. (Wiersma-South Dakota)

IN SEARCH OF WETLANDS,
R. Nyc.
Water Spectrum, Vol 12, No 2, p 17-25, Spring 1980. 9 Fig, 1 Tab, 2 Ref.

Descriptors: *Wetlands, *Surveys, *Mapping, *Terrain analysis, Classification, Systematics, Aerial photography, Remote sensing, Wildlife, Census, Swamps, Bogs, Aquatic habitats, Marshes, Fen.

Stereoscopic interpretation of high quality, small scale, aerial photography is being used to produce maps for the U.S. Fish and Wildlife Service's National Wetlands Inventory (NWI). So that the inventory will be consistent nationwide, old terms such as bogs, marshes, fens, and swamps are not used in the new classification system. The NWI system has five broad ecological systems that have hierarchical structures to describe hydrological, biological and physical aspects of wetland areas. Other elements allowed in the system include modifiers for water regime, water chemistry, soils, and man-influence. For mapping, each element in the system is assigned a letter or number and an alpha-numeric composite code is used to identify a particular wetland. Depending on the availability of base maps two types of inventory maps are being produced: large scale maps (1:24,000 or 1:62,500), and small scale maps (1:100,000). Transitional zones, areas where wetland and upland plants share common ground, are also included in the inventory. No attempt is made by the NWI to define limits of proprietary jurisdiction of regulatory agencies. To check map accuracy field review is conducted by the Corps of Engineers. The smallest wetland mapped is between one and five acres although in some areas greater detail is possible. A Wetland Analytical Mapping System is planned to produce digitized wetland information directly from aerial photographs which will be even more accurate than the current cartographic procedure. DOWSERS WIELD WEIRD WANDS: IS IT SCIENCE, ART OR MAGIC,
R. Wolkomir.
Science Digest, p 66-71, March, 1978.

Descriptors: *Ground water, *Exploration, Remote sensing, Subsurface investigations, Electromagnetic waves.

Interest in dowsing is on the increase but many scientists remain skeptical. Several studies have put the success rate for dowsed wells and undowsed wells about the same. One study at Harvard University concluded that dowsers unconsciously move the rods themselves by minute muscular responses to subliminal geological clues to ground water. Other researchers have found that dowsers are sensitive to changes in electro-magnetic fields. However, this sensitivity does not explain other dowser claims such as the ability to locate ground water using maps, or the ability to change the direction of ground water flow. The U.S. Geological Survey, after having examined the literature and the results of scientifically controlled experiments on dowsing, has concluded that the expense of further tests of water dowsing is not justified. A SIMPLE DIGITAL RATE-METER FOR CURRENT METERS (NOTE),
Department of Scientific and Industrial Research, Taupo (New Zealand). Ecology Div.
M. M. Gibbs.
Journal of Hydrology (New Zealand), Vol 18, No 1, p 55-58, 1979. 2 Fig, 1 Ref.

Descriptors: *Current meters, *Automatic control, *Automation, *Instrumentation, Equipment, Design, Currents(Water), Flow, On-site investigations, Measurement, Hydrology, Streamflow, *Flow measurement.

Current meters are frequently used in the gaging of streams and rivers; these instruments emit one or more pulses per revolution of the rotor, pulses which the operator hears in an earphone and must count over a timed period. While counting at low speeds presents no problems, errors can occur when the currents are fast or the operator is tired. The device described in this paper was designed to reduce counting errors and make gaging easier. It provides an accurate count, even at rates greater than 20 counts per second, automatically stopping after a preselected time period. It has proved easy to use and reliable, and is both light and compact enough to be hung around the operator's neck, thus leaving his hands free. (Sims-ISWS)
W80-04537

INSTANTANEOUS RAINFALL RATE: ITS MEASUREMENT AND ITS INFLUENCE ON HIGH-VOLTAGE TRANSMISSION LINES,
American Electric Power, North Liberty, IN.
H. Kirkham.
Journal of Applied Meteorology, Vol 19, No 1, p 35-40, January 1980. 8 Fig, 3 Ref.

Descriptors: *Rainfall, *Rainfall intensity, *Rain gages, *Electric power, Measurement, Equipment, Electrical coronas, Transmission lines, Transmission(Electrical), Precipitation(Atmospheric), Meteorology, Engineering, Electrical engineering.

When a high-voltage transmission line is exposed to rain, there is generally a small amount of corona activity at the surface of the conductors. This activity usually results in a power loss and the generation of audible and radio noise. While the power loss is generally very small compared to the power transmitted, it is possible to measure it on short test lines where no power is carried through the line. It has been found that there are variations in the power loss, and to a lesser extent in the audible and radio noise, during a typical rainstorm. These variations have been ascribed to variations in the instantaneous rainfall rate. An instrument was developed to measure the instantaneous rainfall rate. The results confirm, in fact, that most of the variations in the corona parameters can be attributed to variations in the instantaneous rainfall rate, although the relationships are not simply linear. The instrument was described in this paper, and some of the results showing the correlation between rainfall rate and the corona loss and audible noise from an ultra-high voltage test line in northern Indiana were presented. SIMPLE FIELD METHODS FOR ESTIMATING SOIL HYDRAULIC CONDUCTIVITY,
Sao Paulo Univ. (Brazil). Center for Nuclear Energy in Agriculture.
P. L. Libardi, K. Reichardt, D. R. Nielsen, and J. W. Biggar.
Soil Science Society of America Journal, Vol 44, No 1, p 3-7, January-February 1980. 4 Fig, 2 Tab, 10 Ref.

Descriptors: *Hydraulic conductivity, *Soil physical properties, *Methodology, *Moisture content, On-site tests, Soil water movement, Infiltration, Steady flow, Spatial distribution, Soil water redistribution.

Soil water content profiles monitored as a function of time following steady-state infiltration conditions in a field soil provide the only data necessary to estimate the soil hydraulic conductivity as a function of soil water content. For two proposed methods, it is assumed that water redistributes only in response to the gravitational field and that the hydraulic conductivity is an exponential function of soil water content. Experiments were conducted on three fallow field soils covered with plastic to prevent evaporation and sampled to depths of nearly 2 m. Values of hydraulic conductivity calculated by both the two proposed methods as well as by a third recently reported method were compared with those calculated by integrating Richards' equation without simplifying assumptions. Although the above comparisons at given sites within a field revealed that the three methods may sometimes yield poor estimates of the hydraulic conductivity, distributions of observed values averaged over the entire field were statistically comparable for 20 observations. It was concluded that a greater number of observations made possible by simplifying assumptions, and hence, less instrumentation and cost, is preferable to fewer observations with more exact methods that are not as amenable to statistical analyses over larger land areas. A STUDY OF STRONTIUM-90 MOVEMENT IN A SANDY SOIL,
CEA Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-les-Durance (France). Service de Radio-Agronomie.
P. Couchat, F. Brissaud, and J. P. Gayraud.
Soil Science Society of America Journal, Vol 44, No 1, p 7-13, January-February 1980. 6 Fig, 3 Tab, 18 Ref.

Descriptors: *Strontium, *Dispersion, *Soils, *Adsorption, *Leaching, Solutes, Tracers, Radioisotopes, Sands, Pore water, Velocity, Hysteresis, Calcium, Desorption, Shaking, Soil columns, CSMP(Continuous System Modeling Program).

Different methods were used to describe 90Sr movement in a Montpellier sandy soil at a pore water velocity of about 0.1 cm/sec. Shaking tests showed that the adsorption and the desorption of 90Sr on this soil material may be considered as instantaneous and that the equilibrium adsorption-desorption relation was hysteretic. However, adsorption-desorption data obtained from material balance calculations on effluent data from soil columns did not agree with those obtained from shaking tests. This difference was confirmed by comparison of measured breakthrough curves for 90Sr and tritiated water with those calculated using equilibrium isotherms obtained from shaking tests. Equilibrium adsorption-desorption isotherms obtained from fitting of experimental breakthrough curves by a S/360 CSMP simulation model agreed well with the experimental data derived from the material balance method. The results show that isotherms from shaking tests overestimate the effect of 90Sr adsorption-desorption during transport. The hysteresis effect was less pronounced in the data obtained by the material balance method, and it was shown that an approximating, linear, nonhysteretic adsorption-desorption isotherm adequately described for practical purposes the leaching of 90Sr in the sandy soil. (Visocky-ISWS)

DESK TOP METHODOLOGY FOR MODELING BIOCHEMICAL OXYGEN DEMAND IN STREAMS,
Rutgers - The State Univ., New Brunswick, NJ. Water Resources Research Inst.
W. Whipple, Jr., and J. V. Hunter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-176142, Price codes: A02 in paper copy, A01 in microfiche. Partial completion report, April 1980. 16 p. OWRT A-046-NJ(4), 14-34-0001-9032.

Descriptors: *Biochemical oxygen demand, *Dissolved oxygen, *Mathematical models, Organic matter, Oxygen sag, Water pollution, Water quality, Streams.

The modeling of dissolved oxygen as widely practiced involves considerable uncertainties due partly to the assumptions not fully represented by the model and also, usually great deficiencies in data. The diurnal fluctuation of oxygen complicates the water. Methods are presented and illustrated for modeling the BOD process instead, and later calculating the critical oxygen condition at the sag point only. The necessary computations can be made by hand calculator, and used quickly to check validity of data.

EXOTIC TECHNIQUES HELP DRILLERS.
Drilling Contractor, Vol 36, No 3, p 21-22, March, 1980. 3 Fig.

Descriptors: *Drilling equipment, *Drilling fluids, *Telemetry, Logging instrumentation, Electronic equipment, Boreholes, Rotary drilling, Downhole motors.

New developments in drilling technology are described. A wire telemetry system stores logging cable in a long loop inside drill pipe. The loop rotates with the drill pipe and the cable is withdrawn as the drill string lengthens. The electronic package can reliably withstand the rigors of bottom-hole drilling conditions. For certain formations the use of air, mist, or foam as drilling fluids can result in considerable economic advantage over liquid mud systems in terms of penetration rate and bit life. A dual string-airlift reverse circulation method was used to drill 120-inch holes at the Nevada Test Site. The mechanics of this method are based on the principles of air-lift pumping. Air and fluid are introduced in the annulus between the drill pipe and inner string. Drilling fluids exit through the bit jets to clean the bottom of the hole and air exits through the air jets to provide the required air lift for the fluid and cuttings. An advanced well drilling method, called Electrodrill, includes a downhole electric drill motor and electronic sensor plus telemetric package linked to the surface with a cable/connector conductor system, power generation and regulation equipment. WATER RESOURCES DATA FOR NEW MEXICO, WATER YEAR 1978.
Geological Survey, Albuquerque, NM. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-160864, Price codes: A99 in paper copy, A01 in microfiche. Geological Survey Water-Data Report NM-78-1, September 1979. 677 p, 6 Fig, 3 Tab.

Descriptors: *New Mexico, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1978 water year for New Mexico consist of records of discharge and water quality of streams; stage, contents and water quality of lakes and reservoirs; and water levels and water quality in wells and springs. This report contains discharge records for 229 gaging stations; stage and contents for 24 lakes and reservoirs; water quality for 89 gaging stations, 15 partial-record stations, 2 reservoirs, 3 springs and 99 wells; and water levels for 96 observation wells. Also included are 144 crest-stage partial-record stations and 2 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in New Mexico. (Kosco-USGS)
W80-04547

WATER RESOURCES DATA FOR ARKANSAS, WATER YEAR 1978.
Geological Survey, Little Rock, AR. Water Resources Div.
Geological Survey Water-Data Report AR-78-1, September 1979. 668 p, 5 Fig, 3 Tab.

Descriptors: *Arkansas, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1978 water year for Arkansas consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of wells. This report contains discharge records for 75 gaging stations; stage only records for 1 gaging station; stage and contents for 10 lakes and reservoirs; water quality for 156 stations, 85 partial-record flow stations, and seven lakes; and water levels for 91 observation wells. Also included are 122 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Arkansas. (Kosco-USGS)
W80-04548

WATER RESOURCES DATA FOR MISSISSIPPI, WATER YEAR 1978.
Geological Survey, Jackson, MS. Water Resources Div.
Geological Survey Water-Data Report MS-78-1, February 1980. 507 p, 5 Fig.

Descriptors: *Mississippi, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1978 water year for Mississippi consist of records of stage and discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels of wells. This report contains discharge records for 82 gaging stations, stage records for 15 of these gaging stations. Stage only for 3 gaging stations, contents for 4 lakes, water quality for 25 gaging stations, and 164 wells, and water levels for 175 observation wells. Also included are data for 92 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Mississippi. (Kosco-USGS)

WATER-QUALITY DATA FOR THE HANNA AND CARBON BASINS, WYOMING,
Geological Survey, Cheyenne, WY. Water Resources Div.
P. B. Freudenthal.
Available from: OFSS, USGS Box 25425, Fed. Ctr. Denver, CO. 80225, paper copy $6.00, micro-

fiche $3.50. Geological Survey open-file report 79-1277, August 1979. 41 p, 4 Fig, 7 Tab, 10 Ref.

Descriptors: *Water quality, *Hydrologic data, *Wyoming, *Groundwater, *Surface waters, Data collections, Sites, Gaging stations, Water wells, Sampling, Sediment load, Chemical analysis, Water analysis, Trace elements, Radiochemical analysis, *Hanna Basin(Wyo), *Carbon Basin(Wyo).

Water-quality data for the Hanna and Carbon Basins, south-central Wyoming, are presented in tables with no interpretation. Common-constituent, trace-element, and radiochemical data for ground and surface water and sediment concentrations for surface water are included. Ground water at 53 sites and surface water at 3 gaging stations were sampled. (Kosco-USGS)
W80-04560

GROUND-WATER BASIC DATA FOR RANSOM AND SARGENT COUNTIES, NORTH DAKOTA,
Geological Survey, Bismarck, ND. Water Resources Div.
C. A. Armstrong.
North Dakota County Ground-Water Studies 31--Part II, and North Dakota Geological Survey Bulletin 69-Part II, 1979. 637 p, 2 Fig, 1 Plate, 5 Tab, 21 Ref.

Descriptors: *Groundwater, *Basic data collections, *North Dakota, *Groundwater availability, *Water quality, Aquifers, Water wells, Logging(Recording), Observation wells, Well data, Chemical analysis, Groundwater movement, Mineralogy, Water properties, Potential water supply, Water utilization, Ransom County(N Dak), Sargent County(N Dak).

This report contains hydrologic data for wells and test holes in Ransom and Sargent Counties, N. Dak. Included are logs of test holes and wells, chemical analyses of water samples, chemical analyses of minor elements in ground water, and water-level measurements in observation wells. The data are useful for evaluating ground-water and geologic conditions in Ransom and Sargent Counties. (Kosco-USGS)
W80-04564

HYDROGEOLOGY OF THE PEERLESS LAKE AREA, ALBERTA,
Research Council of Alberta, Edmonton.
W. Ceroici.
Earth Sciences Report 79-5, 1979. 10 p, 2 Fig, 1 Tab, 13 Ref, 1 Append, 1 Map.

Descriptors: *Hydrogeology, *Groundwater, *Aquifers, *Canada, *Data collections, Aquifer characteristics, Geology, Groundwater movement, Water quality, Calcium, Magnesium, Lakes, Stratigraphy, Hydrologic aspects, Artesian aquifers, Water yield, Alluvial aquifers, Vegetation, Topography, Climatology, *Alberta, *Peerless Lake(Alberta).

The Peerless Lake map area (NTS 84B), situated in north-central Alberta, is bounded by longitudes 114 deg and 116 deg west and latitudes 56 deg and 57 deg north. Total area is approximately 13,000 sq km. The area is sparsely populated and access is poor. The area is covered by thick surficial deposits, primarily of glacial origin, overlying Cretaceous shales. Yields of up to 38 L/s (500 igpm) may be obtained from glaciofluvial deposits. The greatest yields are available from preglacial sands and gravels located in portions of the Misaw and Atikameg Buried Valleys. In general, the bedrock is a poor aquifer yielding usually less than 0.4 L/s (5 igpm). Groundwater from surficial deposits is predominantly the calcium/magnesium-bicarbonate type with an average total dissolved solids concentration of 1000 mg/L. Muskeg waters chemically resemble waters from surficial deposits, but total dissolved solids concentration rarely exceeds 250 mg/L. Bedrock groundwaters are the sodium/potassium-chloride type with an average total dissolved solids concentration of over 2000 mg/L. (Humphreys-ISWS)

AIDS FOR DOCUMENTING FIELD DATA,
Hydro-Search, Inc., Denver, CO.
L. C. Atkinson.
Ground Water, Vol 18, No 1, p 70-76, January-February, 1980.

Descriptors: *Drilling logs, *Data collections, *Well data, *Documentation measurement, Monitoring, Sampling, Analysis, Charts, Investigations, Hydrologic data, Water quality, Water levels, Water wells.

Field data forms for aquifer tests, water level measurement, borehole logs, well construction summaries, and water quality sampling and analysis are described. The borehole logs records standard, basic geologic information, as well as parameters specifically relevant to boreholes used for exploration or water supply. The well construction summary provides a concise, comprehensive documentation of the drilling, design, construction, and development of a water well. The aquifer test form records data from both pumping and observation wells during the pumping and/or recovery portions of an aquifer test. The water level data form is used to record water levels in wells as part of monitoring programs, well inventories, etc. It can record time versus water level for a single well or water levels in numerous wells on a single date. The field water quality sampling and analysis form records basic field water chemistry data, and sampling and preparation/preservation techniques. It can be used for sampling and analysis of both ground and surface water and for recording any variations in water quality parameters during an aquifer test. (Purdin-NWWA)

BROAD-CRESTED WEIRS FOR PORTABLE FLOW METERING,
Science and Education Administration, Phoenix, AZ. Water Conservation Lab.
J. A. Replogle, and A. J. Clemmens.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 6, p 1324-1328, November-December 1979. 8 Fig, 1 Tab, 11 Ref.

Descriptors: *Weirs, *On-site investigations, *Critical flow, *Discharge measurement, *Irrigation canals, Flow measurement, Hydraulics, Open channel flow, Submergence, Design, Hydraulic engineering, *Broad-crested weirs, Portable measuring flumes.

A portable flume was developed to measure flow rates in standard concrete slip-form irrigation canals with a 0.305-m (1 ft) bottom width and 1:1 side slopes. The flume weighs less than 14 kg (30 lb) and would fit in a 0.915-m (3-ft) cube. The flume resembles a broad-crested weir with only two finished surfaces: a long, flat weir crest and a rounded approach ramp. The flume calibration was derived from a mathematical model that has been verified by laboratory testing. The flow depth upstream from the weir is translated to a point above the flume throat, making it relatively insensitive to leveling inaccuracies. This device makes flow measurement both fast (typically 5 to 10 min) and accurate (within + or - 2%). (Adams-ISWS)

DESIGN OF GRAVEL PACKS IN DEVIATED WELLBORES,
Exxon Production Research Co., Houston, TX.
C. Gruesbeck, W. M. Salathiel, and E. E. Echols.
Journal of Petroleum Technology, Vol 31, No 1, p 109-115, January 1979. 9 Fig, 1 Tab, 8 Ref.

Descriptors: *Boreholes, *Gravels, *Well filters, Well screens, Slurries, Laboratory tests, Model-studies, Lysimeters, Mathematical models, Velocity, Pressure head.

Deviated borehole often have unstable or incomplete placement of gravel around the screen and result in sand production. The process by which gravel is transported in deviated wells is described on the basis of observations made while gravel packing small-scale laboratory models. A new design technique is derived that can predict whether a set of design conditions will result in a complete gravel pack that fills the entire borehole-screen annulus. Two experimental relationships which determine the correct design conditions are: (1) the equilibrium velocity necessary to prevent particle deposition in the casing screen annulus, and (2) the incremental pressure gradient caused by the solids in the flowing particle slurry. Experimental relationships for the equilibrium velocity and the pressure gradient of particle slurries were combined with steady state mass and momentum balances to develop a mathematical model of the gravel placement process. The predictions of the model were verified in full-scale gravel-packing studies. Twenty deviated boreholes with angles of deviation from 45 to 62 degrees and with lengths ranging from 40 to 240 ft have been successfully gravel packed using this technique. (Purdin-NWWA)

WELL GROUTING AND CASING TEMPERATURE INCREASES,
Auburn Univ., AL. Dept. of Civil Engineering.
R. C. Johnson, Jr., C. E. Kurt, and G. F. Dunham, Jr.
Ground Water, Vol 18, No 1, p 7-13, January-February, 1980. 13 Fig, 1 Tab, 7 Ref.

Descriptors: *Cement grouting, *Water wells, *Well casing, *Temperature, Plastic pipe, Heat resistance, Portland cements, Laboratory tests, Hydration, Heat, Curing, Deformation, Collapse.

When Portland cement-based grouts cure, a by product of the process is the heat of hydration which may result in deformation and premature collapse of thermoplastic well casing. Since each type of thermoplastic casing has specified temperature limits, it is important to know the range of temperature increases that might occur during grouting. A series of laboratory experiments was performed to determine these temperature increases. The Type I Portland cement used in the experiments was found to produce a higher peak temperature than a similar mix containing 2 percent calcium chloride. For nominal 1 1/2-inch grout thickness, temperature increases between 17 F and 25 F were achieved. With a 3 5/8-inch grout thickness, peak temperature increased to 67F. Where thick grout envelopes occur as a result of caving within the borehole, temperature increases on the order of 170-190F can be expected. Casing temperature usually reaches a peak 8-10 hours after water was added to the cement and remained near the peak temperature for several hours before returning to the original temperature. The ratios of the grout-soil interface surface area and the grout-casing interface area to the grout volume significantly influences the peak casing temperatures. Small-diameter casings have higher peak temperatures than large diameter casing. (Purdin-NWWA)

Append. EM 1110-2-501.

Descriptors: *Wastewater treatment, *Physical processes, *Biological processes, *Chemical processes, *Design criteria, *Wastewater treatment facilities, Treatment, Wastewater disposal, Waste disposal, Waste treatment, Tertiary treatment, Sewage treatment, Biological treatment, Design, Urbanization.

This manual provides guidance for the selection of wastewater treatment systems and processes and criteria for the design of wastewater treatment facilities in urban areas. Part One serves to familiarize the designer with the practical and theoretical aspects of physical, chemical, and biological processes and process trains for urban-type facilities ranging from simple to complex systems, including tertiary systems for nutrient removal. The physical unit processes discussed include grit removal, screening, commination, equalization, flotation, thickening (gravity), sedimentation (primary and secondary clarifier), filtration, vacuum filtration, centrifugation, microscreening, drying beds, postaeration, sludge hauling and landfilling, multiple-hearth incineration and fluidized bed incineration. The chemical unit processes discussed are carbon absorption, chemical coagulation, ammonia stripping, chlorination, ion exchange, neutralization, recarbination and two-stage lime treatment. The biological unit processes described are trickling filters, plug flow activated sludge, complex mix activated sludge, step aeration activated sludge, extended aeration activated sludge, modified or high-rate aeration activated sludge, contact stabilization activated sludge, pure oxygen activated sludge, aerated aerobic lagoons, aerated facultative lagoons, oxidation ditch, nutrification-denitrification, aerobic digestion, anerobic digestion and stabilization ponds. Factors determining process selection include stream standards and/or receiving water quality, federal state and local effluent criteria, wastewater characteristics, economics, availability of fuel and/or electric power, specific exclusions of certain processes and possible requirements for future expansion and/or upgrading. HYBRID ENERGY SYSTEM: WIND AND WATER,
Nevada Univ. System, Reno. Desert Research Inst.
J. W. Fordham, M. K. Peck, R. McMullen, and A. B. Cunningham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-171218, Price codes: A05 in paper copy, A01 in microfiche. Publication No 41062, February 1980. 74 p, 18 Fig, 7 Tab, 10 Ref, 1 Append. OWRT B-086-NEV(1), 14-31-0001-6098.

Descriptors: *Hydroelectric power, *Winds, *Energy conversion, *Reservoir storage, Powerplants, Electric power costs, Power operation and maintenance, Electric power rates, Nevada, Transmission lines, Wind velocity, Air circulation, Design criteria.

The potential for using wind together with hydro generation to meet small area energy demands was examined and a prototype wind-hydro system was modeled for a Nevada site to determine optimum component sizes and operation. The wind-hydro system is designed as an alternative to conventional power generation methods especially in remote areas where the construction of transmission lines is not economically practical. The system includes a reservoir to catch as much runoff as possible, a hydroelectric generation plant, a wind turbine, and a generator. To offset the variability of energy supply from the wind, wind energy conversion systems (WECS) drive recharge pumps to the upstream reservoir where water is stored to be released to drive the hydroelectric generators when needed for a steady energy supply. Costs and benefits are examined in a generalized manner for six preliminary designs then in detail for a wind-hydro system located on Slide Mountain in Nevada. Major points of wind-hydro consideration resulting from the site specific study include: the availability and reliability of wind data, ice accumulation on the WECS structure, WECS cost reduction, pump cost estimates, penstock and recharge pipe assumptions, reservoir costs, reservoir losses, streamflow characteristics, and the market value of power. The wind-hydro system can be a profitable alternative that employs a free, inexhaustible, nonpolluting form of energy. (Seigler-IPA)

EVALUATION AND DESIGN OF DOWNHOLE HEAT EXCHANGERS FOR DIRECT APPLICATION,
Oregon Inst. of Tech., Klamath Falls. Geo-Heat Utilization Center.
G. Culver, and G. M. Reistad.
Geo-Heat Utilization Center Quarterly Bulletin; Vol 1, No 3, August, 1975. 12 p, 16 Fig, 2 Tab, 2 Ref.

Descriptors: *Geothermal studies, *Heat exchangers, *Shallow wells, *Mathematical models, Design, Economics, Energy equation, Convection, Mixing, Discharge(Water), Flow measurement.

The results of a study of the design and economics of downhole heat exchanger (DHE) systems are presented. Energy balance calculations and measurements of convection cell circulation in hot wells were used to develop analytical models to predict heat extraction rates with and without a DHE. In general, increases in source temperature, well diameter, and mass flow rate provide increased energy extraction rates. Mixing of new and circulating well water can be calculated but not accurately predicted before testing a well. Multitube heat exchangers were designed and tested with outputs within 15% of the values predicted by the analytical models. Economic analyses indicate that for small to moderate withdrawal rates from shallow wells and about 300 KW thermal, DHE's may be more economical than pumped systems when surface discharge is not acceptable. (Purdin-NWWA)

STUDIES AIM AT OPTIMUM DESIGN FOR PDC HARD-FORMATION BITS,
Sandia Lab., Albuquerque, NM.
S. G. Varnado, C. F. Hunt, and P. Yarrington.
World Oil, Vol 190, No 4, p 63-66, 70, March, 1980. 8 Fig, 33 Ref.

Descriptors: *Drill bits, *Geothermal studies, *Laboratory tests, *On-site tests, Computer models, Stress analysis, Design, Bonding, Penetration, Crystalline rock.

Geothermal drill bits using polycrystalline diamond compact (PDC) cutters have the potential for increasing penetration rate and reducing the cost of drilling. The results of single cutter tests, bit design, bonding of cutters to the bit body, and lab and field tests on new bit designs are described. A computer program was developed to model the stresses induced into the tool by the tool-rock interaction and to design the optimum cutting structures. Main problem areas identified during testing are: attachment of cutters to the tool post or to the bit body directly; and potential for tool post breakage in field drilling operations. (Purdin-NWWA)

DIAMOND COMPACT CUTTER STUDIES FOR GEOTHERMAL BIT DESIGN,
General Electric Corporate Research and Development, Schenectady, NY. Physical Chemistry Lab.
L. E. Hibbs, Jr., and D. G. Flom.
Journal of Pressure Vessel Technology, Vol 100, No 11, p 406-416, November, 1978. 17 Fig, 4 Tab, 7 Ref.

Descriptors: *Drilling equipment, *Geothermal studies, *Laboratory tests, Penetration, Rock excavation, Research and development, Design data, Abrasion, Rotary drilling.

Rock cutting studies using diamond compact cutters were undertaken to determine the following relationships needed in designing a more efficient geothermal bit: (1) the effect of cutter size on rate of material removal and on torque, (2) the effect of the degree of cutter overlap on cutting efficiency; (3) penetration rate as a function of rotational speed and cutter size; (4) the effect of rotational speed on force and cutter wear rate; (5) the effect of cutter geometry on penetration rate, force, and cutter wear rate; and (6) variations of these parameters as required by the range of rock properties encountered in geothermal formations. Rake angles affected cutting efficiency at light cuts but were less significant at high penetration forces. In continuous turning, cutter forces exhibit regular, repeated variations due to the rock undergoing alternate crushing and fracturing. In interrupted cutting, the variations in forces are no greater than in continuous cutting. Thus, force fluctuations when cutting a composite of hard and soft rock should not be significantly greater than those generated in cutting each rock separately. The effects of changing speed were not as great as those of geometry and depth of cut. (Purdin-NWWA)

THE EVALUATION OF A SYNTHETIC MATERIAL FOR USE AS A WAVE PROTECTION AGENT ON IRRIGATION DAMS,
Missouri Univ.-Rolla. Dept. of Civil Engineering.
R. W. Stephenson, L. D. McCallister, and D. L. Dutton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-173586, Price codes: A08 in paper copy, A01 in microfiche. Missouri Water Resources Research Center, University of Missouri, Completion Report, March 1980. p 162, 79 Fig, 11 Tab, 117 Ref, 4 Append. OWRT B-122-MO(2), USDI-OWRT-14-34-0001-8095.

Descriptors: *Earth dams, Erosion, Dams, Filter fabrics, Models, Reservoirs, Shore protection, Waves(Water), Protection, *Irrigation dams, *Slope protection, Model studies, *Bank protection, *Sand pillows.

This report presents the results of a field and laboratory testing program to evaluate the performance of a slope protection method utilizing a new synthetic fabric material in the form of soil filled bags. The results of this investigation indicate that the system is readily installed on irrigation dams and offers excellent slope protection. The factors which influence the practicality of the system include the cost of alternate slope protection methods, the position of the irrigation dam in relation to local winds and the availability of fill material for the bags. A medium-scale laboratory model study was performed on a new synthetic fabric designed to be used in the form of soil-filled 'sand pillows' in order to determine the relationship that affect the stability of the pillows and to determine basic design criteria for the protection system. Laboratory tests were conducted to determine the soil retention characteristics of the fabric. The results of the model study investigation indicate that the stability of sand pillows is primarily a function of wave height, wave period, embankment slope angle, and individual sand pillow

weight. A possible design equation was developed for a silty clay soil such that the wave height calculated for a given reservoir could be utilized to determine the weight of the individual sand pillow necessary to economically and effectively protect the embankment.

GROUNDWATER CHARACTERISTICS AND CORROSION PROBLEMS ASSOCIATED WITH THE USE OF GEOTHERMAL WATER IN KLAMATH FALLS, OREGON,
Oregon Inst. of Tech., Klamath Falls. Geo-Heat Utilization Center.
J. W. Lund, G. Culver, and P. J. Lienau.
Geo-Heat Utilization Center Quarterly Bulletin, Vol 3, No 2, May, 1977. 17 p, 4 Fig, 6 Tab, 10 Ref.

Descriptors: *Geothermal studies, *Corrosion, *Water chemistry, *Materials testing, Scaling, Temperature, Corrosion control, Well casings, Heat exchangers, Regression analysis, Geochemistry, Ions, Steel pipes.

This report presents the results of two investigations of corrosion of downhole heat exchangers. In one study, temperature and chemistry data for over 100 wells were collected and correlated with heat exchanger service life. Contrary to results of other corrosion studies, high temperature was related to longer service life. However, this may be due to some other factor related to high temperature. Corrosion and scaling of well casing is not as severe as that of heat exchangers since fluid production through the casing is not required. Corrosion occurs at the air/water interface and can be effectively reduced by pouring oil or wax in the well. In the second study, corrosion rates for various materials were determined from coupon tests in well water with temperatures ranging from 32 to 49C, pH between 7.1 and 8.2, and total dissolved solids content of about 800 ppm. Mild steel had low resistance to corrosion. Ions having the highest correlation with corrosion rate were sodium, water hardness, chloride, sulfate, and pH. (Purdin-NWWA)

IMPROVING STREAM FISHERIES,
Oklahoma State Univ., Stillwater.
O. E. Maughan, and K. L. Nelson.
Water Spectrum, Vol 12, No 2, p 11-15, Spring 1980. 5 Fig, 5 Ref.

Descriptors: *Virginia, *Stream improvement, *Fish management, *Stream fisheries, *Hydraulic structures, Gabions, Dams, Boulders, Trout, Aquatic environment, Biomass, Productivity, Streamflow, Diversion, Runoff, Scour.

Stream physical characteristics, aquatic macroinvertebrates, and fish population in four Virginia streams, North Creek, Jennings Creek, Comers Creek, and Crooked Creek were evaluated to compare improved and unimproved river sections. Various techniques used to improve fishery conditions by increasing pool area and cover amounts in the stream include log dams, boulder enplacements, and gabion deflectors. All of the streams are typical trout waters with rapid flow along mountain slopes. Due to the mountain setting rapid runoff and periodic flooding are common. All of the streams flow through forested land except Crooked Creek which is affected by livestock grazing and adverse agricultural practices. Log dams in North Creek did increase pool area by about 7% but due to improper placement of some of the dams and lack of increased cover the results are not conclusive. Some increases in total biomass were recorded for the improved sections of the stream. The gabions on Jennings Creek did appear to promote pool formation but lack of pregabion data makes accurate assessment difficult. Five of the twelve boulder placements in Crooked Creek did result in undercutting and pool formation. Some negative results of the improvement methods include deposition of sand behind boulders and bank erosion during high flow. Gabions and log dams were susceptible to high flow destruction and did not provide cover. Boulders provide cover but stream depth is a major factor and boulders may be impractical if not readily available. (Seigler-IPA)

HYDROLOGY RESEARCH DIVISION--ANNUAL PROGRESS REPORTS AND SHORT RESEARCH NOTES 1977-78.
Department of Fisheries and Environment, Ottawa (Ontario). Water Resources Branch.
Report Series No 64, 1979. 117 p, 33 Fig, 10 Tab.

Descriptors: *Water quality, *Water quality parameters, *Hydrogeology, *Canada, *Groundwater pollution, Hydrothermal studies, Models, Computer programs, Data retrieval, Well injection, Water pollution, Groundwater, Acquifers, Irrigation, Design flow, Reservoirs, Runoff forecasting.

Results of 29 studies of water quality and water quantity are presented. Included are hydrogeological studies of the effects of open-pit mining and dewatering, a salmon enhancement program, a wildlife preserve, inland wetlands sites, and the hydrogeology of the Fraser Valley. Hydrologic modelling studies presented include: streamflow simulation, evaporation and runoff, mathematical modelling of a wellfield, snowmelt infiltration and runoff, and irrigation return flow amounts and rates. The Bowen-ratio evapotranspiration estimates project is described; an experimental system was set up at Perch Lake during 1977. Inconclusive results were obtained due to system electrical interference. Groundwater studies summarized covered arsenic contamination sites and amounts, and existing groundwater trace element parameters such as pH, Eh, dissolved oxygen, temperature, and major anions and cations in order to assess their influence on trace element migration. Results of use of the GOWN computer program and its ability to document and retrieve data are summarized. A project studying hydrothermal effects in areas adjacent to Artic streams is described, and results of field dispersion tests at the Chalk River Nuclear Laboratories are presented. (Arnold-NC)

UNIVERSITY OF CALIFORNIA
DAVIS

SUBJECT INDEX

2

Toxicity of Butoxyethyl Ester of 2,4-D to Selected Salmon and Trout,
W80-04700 5A

ABSORPTION

The Uptake of Urea by the Diatom, Phaeodactylum,
W80-04653 5C

Studies on the Binding of Heavy Metals to Algal Polysaccharides from Philippine Seaweeds. I. Carrageenan and the Binding of Lead and Cadmium,
W80-04694 5B

Tissue Metal Concentrations in Two Crayfish Species Cohabiting a Tennessee Cave Stream,
W80-04696 5A

Uptake and Elimination of Antimony in the Mussel, Mytilus Edulis,
W80-04697 5C

ACCLIMATION

Respiratory Properties of Erythrocruorin (Extracellular Hemoglobin) in the Blood of the Annelid Arenicola Marina with Special Reference to the Influences of Salinity and Temperature,
W80-04728 5B

Some Effects of Salinity and Temperature on the Osmotic and Ionic Regulation of Praunus Flexuosus (Crustacea, Mysidacea) from Isefjord,
W80-04729 5B

The Effects of Acclimation on the Salinity Tolerance of Grass Carp, Ctenopharyngodon Idella (Cuv. and Val.),
W80-04735 5C

ACIDIC WATER

Effect of Simulated Acid Rain on Sulfate Movement in Acid Forest Soils,
W80-04640 2B

Acidity and Species Diversity in Freshwater Crustacean Faunas,
W80-04731 5A

ACIDITY

Precipitation Acidity: The Role of the Forest Canopy in Acid Exchange,
W80-04521 2K

ACTIVATED CARBON

Response of Biological Reactors to the Addition of Powered Activated Carbon,
W80-04680 5C

ACTIVATED SLUDGE

Response of Biological Reactors to the Addition of Powered Activated Carbon,
W80-04680 5C

ADAPTATION

The Effects of Acclimation on the Salinity Tolerance of Grass Carp, Ctenopharyngodon Idella (Cuv. and Val.),
W80-04735 5C

ADMINISTRATIVE AGENCIES

Government Regulation of Oil Polluters: How Much is Enough,
W80-04579 6E

Congress and Coastal Zone Management,
W80-04584 6E

ADMINISTRATIVE DECISIONS

A Systems Resources Approach to Citizen Participation: The Case of the Corps of Engineers,
W80-04756 6E

ADSORPTION

A Study of Strontium-90 Movement in a Sandy Soil,
W80-04637 7B

Accumulation of 210Pb in Freshwater Plants,
W80-04692 5B

AERIAL CHANGE

Glacier Surveys in Alberta - 1977,
W80-04570 2C

AGE

Growth and Longevity in the Crustose Red Alga Petrocelis Middendorffii,
W80-04651 5C

AGGRADATION

Recent Sedimentation History of the Waimakariri River, New Zealand,
W80-04643 2J

AGRICULTURAL RUNOFF

Phosphorus Variations in Surface Runoff from Agricultural Lands as a Function of Land Use,
W80-04523 5B

Impact of Unconfined Livestock Activities on Water Quality,
W80-04526 5B

Response Functions Applied to a Drainage System,
W80-04530 2G

Soil Conservation and Water Pollution Control: The Muddy Record of the United States Department of Agriculture,
W80-04791 6E

AIR POLLUTION

Water Intake, Wastewater Production and Treatment, and Air Pollution Control in Coal-Fired Steam-Electric Power Generating Stations.
W80-04565 5D

ALABAMA

Flood Hazard Study Tallasseehatchee Creek and Tributaries in Vicinity of Jacksonville, Alabama.
W80-04611 2E

ALASKA

Crystal Alignments in the Fast Ice of Arctic Alaska,
W80-04636 2C

ALBERTA

Hydrogeology of the Peerless Lake Area, Alberta,
W80-04646 7C

ALGAL TOXINS

Toxic Dinoflagellates and Tidal Power Generation in the Bay of Fundy, Canada,
W80-04704 5A

AMMONIA

Acute Toxicity of Residual Chlorine and Ammonia to Some Native Illinois Fishes,
W80-04668 5C

Effects of Ammonia and Ammonium on Tolerance and Byssogenesis in Perna Viridis,
W80-04721 5C

ANADROMOUS FISH

The Law of the Sea and Management of Anadromous Fish Stocks,
W80-04589 6E

ANAEROBIC BACTERIA

Irrigation Return Flow Treatment by Biological Denitrification Process for Nitrate Removal,
W80-04610 5D

ANALYSIS

Effect of Climate and Temperature on the Amount of HC03(-) and H2C03 of Groundwaters (Influence du Climat, de la Temperature sur la Teneur en HC03(-) et H2C03 des Eaux Souterraines),
W80-04623 2F

ANALYTICAL TECHNIQUES

Analysis of Structural and Nonstructural Flood Control Measures Using Computer Program HEC-5C,
W80-04772 6A

ANIMAL PHYSIOLOGY

Variables Affecting Body Burdens of Lead, Zinc and Cadmium in a Roadside Population of the Snail Cepaea Hortensis Muller,
W80-04702 5C

ANNELIDS

Respiratory Properties of Erythrocruorin (Extracellular Hemoglobin) in the Blood of the Annelid Arenicola Marina with Special Reference to the Influences of Salinity and Temperature,
W80-04728 5B

ANTIMONY

Uptake and Elimination of Antimony in the Mussel, Mytilus Edulis,
W80-04697 5C

APPALACHIAN MOUNTAIN REGION

Effects of Wood Products Harvest on Forest Soil and Water Relations,
W80-04519 4C

AQUA-KLEEN

Toxicity of Butoxyethyl Ester of 2,4-D to Selected Salmon and Trout,
W80-04700 5A

AQUATIC ENVIRONMENT

Limnological Studies in Montana: Hyalite Reservoir and Responses of Lotic Periphyton to Deep-Water Discharges, Grazing and Logging,

CONFINEMENT AREAS
Physical Properties of Confined Dredged Materials,
W80-04539 1B

CONFLICTS
Conflicts in Attaining National Goals for Both Water Quality and Energy Production,
W80-04755 6D

CONNECTICUT
The Inland Wetlands Act: Reconciling a Collision of Interests,
W80-04576 6E

CONSERVATION
Water Conservation in California.
W80-04750 3D

CONSTRUCTION
Measuring the Social Impacts of Water Resources Projects,
W80-04601 6B

CONSTRUCTION COSTS
The Municipal Program of the Clean Water Act: 1978 Administrative Implementation,
W80-04797 6E

CONSUMPTIVE USE
Estimated Water Use in Florida, 1977,
W80-04557 6D

Kansas Water Rights: More Recent Developments,
W80-04595 6E

Water, Waste and Quality Management During Preparation and Processing of Vegetables,
W80-04671 3F

CONTINENTAL SHELF
Mixing Processes on the Atlantic Continental Shelf, Cape Cod to Cape Hatteras,
W80-04532 5B

The Outer Continental Shelf Lands Act Amendments of 1978,
W80-04572 6E

Images and Models in the World Court: The Individual Opinions in the North Sea Continental Shelf Cases,
W80-04785 6E

The Outer Continental Shelf Lands Act Amendments of 1978: Balancing Energy Needs with Environmental Concerns,
W80-04793 6E

CONVEYANCE STRUCTURES
Interceptor Sewers and Urban Sprawl,
W80-04751 5D

COOLING WATER
Growth of Fish in Heated Environments,
W80-04688 5C

COPEPODS
Continuous Plankton Records: Seasonal Cycles of Phytoplankton and Copepods in the North Atlantic Ocean and the North Sea,
W80-04652 5C

The Effect of Temperature on the Respiration Rate of Meiofauna,
W80-04703 5A

COPPER
Oxygen Content and Toxicity for Fish of Some Substances in Heated Waters,
W80-04681 5A

The Effects of Mercury Exposure on Intracellular Distribution of Mercury, Copper and Zinc in Skeletonema Costatum (Grev.) Cleve,
W80-04695 5B

Tissue Metal Concentrations in Two Crayfish Species Cohabiting a Tennessee Cave Stream,
W80-04696 5A

The Effects of Hardness, Alkalinity and pH of Test Water on the Toxicity of Copper to Rainbow Trout (Salmo Gairdneri),
W80-04699 5B

The Study of Eutrophication of Algal Benthos by Essential Metals in Artificial Rivers,
W80-04726 5A

CORPS OF ENGINEERS URBAN STUDIES
A Systems Resources Approach to Citizen Participation: The Case of the Corps of Engineers,
W80-04756 6E

CORROSION
Groundwater Characteristics and Corrosion Problems Associated with the Use of Geothermal Water in Klamath Falls, Oregon,
W80-04763 8G

Predicted Corrosion and Scale-Formation Properties of Geopressured Geothermal Waters from the Northern Gulf of Mexico Basin,
W80-04766 2K

COST-BENEFIT ANALYSIS
Estimating Costs and Benefits for Nonstructural Flood Control Measures,
W80-04769 6F

Analysis of Structural and Nonstructural Flood Control Measures Using Computer Program HEC-5C,
W80-04772 6A

COURT DECISIONS
Reserved Water Rights and Our National Forests,
W80-04754 6E

Coastal States Have Control of Coastal Resources,
W80-04757 6E

CRABS
Effects of Temperature and Salinity on Larval Development of Pagurus Bernhardus (Decapoda, Paguridae),
W80-04722 5A

Cadmium Toxicity to Three Species of Estuarine Invertebrates,
W80-04736 5A

Kepone Effects on Larval Development of Mud-Crab and Blue-Crab,
W80-04739 5C

CRAYFISH
Tissue Metal Concentrations in Two Crayfish Species Cohabiting a Tennessee Cave Stream,
W80-04696 5A

CRITICAL FLOW
Broad-Crested Weirs for Portable Flow Metering,
W80-04527 8A

CROP RESPONSE
Construction and Performance of Large Automatic (Nonweighing) Lysimeters,
W80-04528 2D

CRUDE OIL
Responses of Salt Marsh Vegetation to Oil Spills and Refinery Effluents,
W80-04743 5C

CRUSTACEANS
Acidity and Species Diversity in Freshwater Crustacean Faunas,
W80-04731 5A

CRYSTALS
Crystal Alignments in the Fast Ice of Arctic Alaska,
W80-04636 2C

CURRENT METERS
A Simple Digital Rate-Meter for Current Meters (Note),
W80-04537 7B

CURRENTS (WATER)
Longshore Pressure Gradients Caused by Offshore Wind,
W80-04626 2L

Recurring Aggregation of Zooplankton by a Tidal Current,
W80-04629 2L

CYTOLOGICAL STUDIES
The Uptake of Urea by the Diatom, Phaeodactylum,
W80-04653 5C

Three Types of Skin Papillomas of Flatfishes and Their Causes,
W80-04713 5A

DAM FAILURE
Probable Hydrologic Effects of a Hypothetical Failure of Mackay Dam on the Big Lost River Valley from Mackay, Idaho, to the Idaho National Engineering Laboratory,
W80-04551 6A

DAMS
Dams and Wildlife,
W80-04678 2I

DAPHNIA
Correlation and Prediction of Metal Toxicity to Aquatic Biota,
W80-04711 5A

Zooplankton Ecology and Pollution Studies,
W80-04725 5C

DATA COLLECTIONS
Glacier Surveys in Alberta - 1977,
W80-04570 2C

Hydrogeology of the Peerless Lake Area, Alberta,
W80-04646 7C

Aids for Documenting Field Data,
W80-04676 7C

DATES
Hydrologic Feasibility of Utilizing Palms for Water Management in Southern Nevada,
W80-04504 3C

DEBRIS AVALANCHES
Debris Flow on Prismatic Open Channel,
W80-04535 2E

DEBRIS REMOVAL
Debris Flow on Prismatic Open Channel,
W80-04535 2E

DECISION MAKING
A Systems Resources Approach to Citizen Participation: The Case of the Corps of Engineers, W80-04756 6E

DEF
A Marine Algal Bioassay Method: Results with Pesticides and Industrial Wastes, W80-04740 5A

DEGRADATION (STREAM)
Recent Sedimentation History of the Waimakariri River, New Zealand, W80-04643 2J

DENITRIFICATION
Irrigation Return Flow Treatment by Biological Denitrification Process for Nitrate Removal, W80-04610 5D

DEPURATION
Uptake and Elimination of Antimony in the Mussel, Mytilus Edulis, W80-04697 5C

DESALINATION PROCESSES
Desalting: An Offer You May Not Refuse, W80-04509 3A

DESIGN CRITERIA
Design of Wastewater Treatment Facilities, Major Systems. W80-04773 8A

DETENTION RESERVOIRS
A Contribution to the Phosphorus Loading Concept, W80-04656 5C

DETRITUS
Measurement of Phytoplankton Growth by Particle Counting, W80-04648 5A

DIATOMS
The Uptake of Urea by the Diatom, Phaeodactylum, W80-04653 5C

The Occurrence of a Hypersensitive Reaction in the Planktonic Diatom Asterionella Formosa Hassall Parasitized by the Chytrid Rhizophydium Planktonicum Canter Emend., In Culture, W80-04654 5C

The Effects of Mercury Exposure on Intracellular Distribution of Mercury, Copper and Zinc in Skeletonema Costatum (Grev.) Cleve, W80-04695 5B

Influence of Secondarily Treated Kraft Mill Effluent on the Accumulation Rate of Attached Algae in Experimental Continuous-Flow Troughs, W80-04715 5C

DINOFLAGELLATES
Toxic Dinoflagellates and Tidal Power Generation in the Bay of Fundy, Canada, W80-04704 5A

DIPTERA
A Comparison of Tolerance to Phenol Exhibited by Aquatic Insects and Arachnida During Ontogenesis, W80-04724 5C

DIRECTIONAL CHANGE
Glacier Surveys in Alberta - 1977, W80-04570 2C

DISCHARGE MEASUREMENT
Broad-Crested Weirs for Portable Flow Metering, W80-04527 8A

DISCHARGE (WATER)
Stochastic Synthesis of Hydrologic Data Based on Concepts of Pattern Recognition, I. General Methodology of the Approach, W80-04510 2E

DISINFECTION
Bacteria: What are They, W80-04748 5A

DISPERSION
A Study of Strontium-90 Movement in a Sandy Soil, W80-04637 7B

Chloride Displacement by Water in Homogeneous Columns of Three Soils, W80-04639 2G

DISSOLVED LOAD
Sediment Loads of North Island Rivers, New Zealand--A Reconnaissance, W80-04644 2J

DISSOLVED OXYGEN
Desk Top Methodology for Modeling Biochemical Oxygen Demand in Streams, W80-04673 7B

Factors Controlling Oxygen Depletion in Ice-Covered Lakes, W80-04712 5A

DISSOLVED SOLIDS
Sediment Loads of North Island Rivers, New Zealand--A Reconnaissance, W80-04644 2J

DISTILLATION
Desalting: An Offer You May Not Refuse, W80-04509 3A

DISTRIBUTION
Continuous Plankton Records: Seasonal Cycles of Phytoplankton and Copepods in the North Atlantic Ocean and the North Sea, W80-04652 5C

DISTRIBUTION PATTERNS
Recurring Aggregation of Zooplankton by a Tidal Current, W80-04629 2L

DIVERSITY INDICES
Zooplankton as an Indicator of Pollution of Reservoirs, W80-04716 5C

Systems of Biological Indicators for Water Quality Assessment, W80-04727 5C

DOCUMENTATION MEASUREMENT
Aids for Documenting Field Data, W80-04676 7C

DRAINAGE
Nitrogen and Water Distributions in Fertilized Sandy Soil During Irrigation and Drainage, W80-04642 2G

DRAINAGE SYSTEMS
Response Functions Applied to a Drainage System, W80-04530 2G

DRAINAGE WATER
Once-Released Irrigation Waters: Liability and Litigation, W80-04789 6E

DREDGED MATERIALS
Physical Properties of Confined Dredged Materials, W80-04539 1B

DREDGING
Physical Properties of Confined Dredged Materials, W80-04539 1B

DRILL BITS
Studies Aim at Optimum Design for PDC Hard-Formation Bits, W80-04767 8C

DRILLING EQUIPMENT
Diamond Compact Cutter Studies for Geothermal Bit Design, W80-04531 8G

Exotic Techniques Help Drillers. W80-04774 7B

DRILLING FLUIDS
Exotic Techniques Help Drillers. W80-04774 7B

DRILLING LOGS
Aids for Documenting Field Data, W80-04676 7C

DROUGHTS
Hydrologic and Human Aspects of the 1976-77 Drought, W80-04552 2E

Critical Drought Analysis of Periodic-Stochastic Processes, W80-04617 2E

Regional Drought and Flood Frequency Analysis: Theoretical Consideration, W80-04618 6A

DYFI RIVER (WALES)
Welsh Floodplain Studies, II. Application of a Qualitative Inundation Model, W80-04511 2E

DYNAMIC PROGRAMMING
Optimizing Flood Operation Rules, W80-04501 6A

EARTH DAMS
The Evaluation of a Synthetic Material for Use as a Wave Protection Agent on Irrigation Dams, W80-04599 8G

EASEMENTS
Enforcing the Federal Water Resource Servitude on Submerged and Riparian Lands, W80-04781 6E

ECOLOGICAL DISTRIBUTION
The River Laxa Ecosystem, Iceland, W80-04663 2E

Dams and Wildlife, W80-04678 2I

ECONOMIC JUSTIFICATION
Environmental Improvement Through Economic Incentives, W80-04752 6E

ECOSYSTEMS
The River Laxa Ecosystem, Iceland, W80-04663 2E

ELECTRIC POWER
Instantaneous Rainfall Rate: Its Measurement and Its Influence on High-Voltage Transmission Lines, W80-04538 7B

ELECTRICAL PROPERTIES
Permittivity of Ice and Water at Millimeter Wavelengths, W80-04635 2C

ELECTRODIALYSIS
Desalting: An Offer You May Not Refuse, W80-04509 3A

EMISSION STANDARDS
Water Intake, Wastewater Production and Treatment, and Air Pollution Control in Coal-Fired Steam-Electric Power Generating Stations.
W80-04565 5D

ENERGY
Impact of Energy Development on the Law of the Colorado River,
W80-04775 6E

The Coastal Zone Management Act Amendments of 1976,
W80-04784 6E

ENERGY CONVERSION
Hybrid Energy System: Wind and Water,
W80-04502 8C

ENERGY PRODUCTION
Conflicts in Attaining National Goals for Both Water Quality and Energy Production,
W80-04755 6D

ENGLAND
The Interpretation of Tritium in the Chalk Unsaturated Zone,
W80-04621 2F

A One-Dimensional Representation of Residual Currents in the Severn Estuary and Associated Observations,
W80-04630 2L

ENTRAINMENT
Production, Mortality, and Power Plant Entrainment of Larval Yellow Perch in Western Lake Erie,
W80-04701 5A

ENVIRONMENT EFFECTS
Limnological Studies in Montana: Hyalite Reservoir and Responses of Lotic Periphyton to Deep-Water Discharges, Grazing and Logging,
W80-04670 4C

ENVIRONMENTAL EFFECTS
Dams and Wildlife,
W80-04678 2I

Heat Pump Update,
W80-04745 5B

EPILITHIC FAUNA
Secondary Production of Epilithic Fauna in a Woodland Stream,
W80-04658 5C

EPN
A Marine Algal Bioassay Method: Results with Pesticides and Industrial Wastes,
W80-04740 5A

EROSION
Nips, Notches, and the Solution of Coastal Limestone: An Overview of the Problem with Examples from Greece,
W80-04628 2J

EROSION CONTROL
Soil-Water Retention, Transmission, and Quality of Leachate from Polymer-Treated Soils, Effects of the In Situ Crosslinking,
W80-04609 2G

ERYTHROCRUORIN
Respiratory Properties of Erythrocruorin (Extracellular Hemoglobin) in the Blood of the Annelid Arenicola Marina with Special Reference to the Influences of Salinity and Temperature,
W80-04728 5B

ESTUARIES
The Estuary Revisited,
W80-04505 2L

A One-Dimensional Representation of Residual Currents in the Severn Estuary and Associated Observations,
W80-04630 2L

Short-Term Variations in Phytoplankton Biomass in a Tidal Estuary in Northern Brittany,
W80-04633 2L

ETHOPROP
A Marine Algal Bioassay Method: Results with Pesticides and Industrial Wastes,
W80-04740 5A

EUTROPHICATION
A Contribution to the Phosphorus Loading Concept,
W80-04656 5C

The Study of Eutrophication of Algal Benthos by Essential Metals in Artificial Rivers,
W80-04726 5A

EVALUATION
River Amenity Evaluation: A Review and Commentary,
W80-04758 6B

Estimating Costs and Benefits for Nonstructural Flood Control Measures,
W80-04769 6F

EVAPOTRANSPIRATION
Construction and Performance of Large Automatic (Nonweighing) Lysimeters,
W80-04528 2D

EVOLUTION
The Estuary Revisited,
W80-04505 2L

EXPLORATION
Dowsers Wield Weird Wands: Is It Science, Art or Magic,
W80-04522 7B

FALL RIVER (CA)
Analysis of Structural and Nonstructural Flood Control Measures Using Computer Program HEC-5C,
W80-04772 6A

FALLOUT
The Interpretation of Tritium in the Chalk Unsaturated Zone,
W80-04621 2F

FARM MANAGEMENT
Planting Wheel Traffic Effects on Interrow Runoff and Infiltration,
W80-04641 2G

FARM WASTES
A Nonpoint Source Model for Land Areas Receiving Animal Wastes: III. A Conceptual Model for Sediment and Manure Transport,
W80-04515 5B

A Nonpoint Source Model for Land Areas Receiving Animal Wastes: IV. Model Inputs and Verification for Sediment and Manure Transport,
W80-04516 5B

FEDERAL GOVERNMENT
Blue Lake: A Struggle for Indian Rights,
W80-04578 6E

FEDERAL GOVERNMENTS
Coastal Zone Management - A Federal Perspective,
W80-04583 6E

FEDERAL PROJECT POLICY
The Enforcement of Federal Reclamation Law in the Westlands Water District: A Broken Promise,
W80-04790 6E

FEDERAL RECLAMATION LAW
The Enforcement of Federal Reclamation Law in the Westlands Water District: A Broken Promise,
W80-04790 6E

FEDERAL WATER POLLUTION CONTROL ACT
Enforcing the Federal Water Resource Servitude on Submerged and Riparian Lands,
W80-04781 6E

Federal Environmental Litigation in 1976: The Federal Water Pollution Control Act,
W80-04783 6E

The Federal Water Pollution Control Act - Industrial Challenges to Effluent Limitations,
W80-04792 6E

Federal Protection of Wetlands Through Legal Process,
W80-04796 6E

FEDERAL WATER POLLUTION CONTROL ACT OF 1972
Coordinating Land and Water Use Planning for Sound Resource Management,
W80-04761 6E

FERRISBURG (VT)
Planning Undeveloped Lakeshore: A Case Study on Lake Champlain, Ferrisburg, Vermont,
W80-04760 6B

FERTILIZERS
Fertilizer Nutrient Losses from Rangeland Watersheds in Central Oklahoma,
W80-04520 5B

FINITE ELEMENT ANALYSIS
A Finite-Element Model for Concurrent Confined-Unconfined Zones in an Aquifer,
W80-04619 2F

FISH
An Environmental Study of the Origin, Distribution, and Bioaccumulation of Selenium in Kentucky and Barkley Lakes,
W80-04672 5B

FISH BEHAVIOR
Behaviour of Fish in a Thermally Differentiated Environment,
W80-04683 5C

Fish Metabolism,
W80-04684 5A

Sexual Maturity of Fish in Heated Waters,
W80-04685 5C

Spawning of Fish and Their Embryonic and Larval Development,
W80-04686 5C

FISH DIETS
Feeding of Fish and Their Feeding Grounds,
W80-04687 5A

FISH DISEASES
Temperature Changes and Fish Diseases,
W80-04689 5C

Three Types of Skin Papillomas of Flatfishes and Their Causes,
W80-04713 5A

FISH GROWTH
Growth of Fish in Heated Environments,
W80-04688 5C

FISH MANAGEMENT
Improving Stream Fisheries,
W80-04506 8I

The Law of the Sea and Management of Anadromous Fish Stocks,
W80-04589 6E

FISH MIGRATION
The Law of the Sea and Management of Anadromous Fish Stocks,
W80-04589 6E

FISH PARASITES
Temperature Changes and Fish Diseases,
W80-04689 5C

FISH PHYSIOLOGY
Behaviour of Fish in a Thermally Differentiated Environment,
W80-04683 5C

Fish Metabolism,
W80-04684 5A

Sexual Maturity of Fish in Heated Waters,
W80-04685 5C

Spawning of Fish and Their Embryonic and Larval Development,
W80-04686 5C

Feeding of Fish and Their Feeding Grounds,
W80-04687 5A

Temperature Changes and Fish Diseases,
W80-04689 5C

FISH POPULATION
The Impact on Ichthyofauna and Possible Control of the Effects of Thermal Discharge,
W80-04691 5A

FISH POPULATIONS
Changes of Fish Communities in Heated Environments,
W80-04690 5C

FISH REPRODUCTION
Spawning of Fish and Their Embryonic and Larval Development,
W80-04686 5C

Changes of Fish Communities in Heated Environments,
W80-04690 5C

FISHERIES
The Roots of U.S. Fisheries Policy,
W80-04587 6E

Changes in the Law of the Sea: Impact on International Fisheries Organizations,
W80-04588 6E

International Law and Maritime Jurisdiction in Relation to Sea Resources: The Case of Fishing in Peru,
W80-04780 6E

FLASH FREEZING
Desalting: An Offer You May Not Refuse,
W80-04509 3A

FLOOD CONTROL
Optimizing Flood Operation Rules,
W80-04501 6A

Water Resources Development Act of 1978.
W80-04594 6E

Estimating Costs and Benefits for Nonstructural Flood Control Measures,
W80-04769 6F

Water Resources Development by the U.S. Army Corps of Engineers in North Carolina.
W80-04770 6B

Analysis of Structural and Nonstructural Flood Control Measures Using Computer Program HEC-5C,
W80-04772 6A

FLOOD DATA
Flood Hazard Study Tallasseehatchee Creek and Tributaries in Vicinity of Jacksonville, Alabama.
W80-04611 2E

FLOOD FORECASTING
The Design of a Flood Forecasting Procedure for the Klang River at Kuala Lumpur,
W80-04536 2E

Floods in Georgia, Magnitude and Frequency,
W80-04546 2E

Techniques for Estimating Magnitude and Frequency of Floods on Rural Unregulated Streams in New York State, Excluding Long Island,
W80-04556 2E

FLOOD FREQUENCY
Floods in Georgia, Magnitude and Frequency,
W80-04546 2E

Techniques for Estimating Magnitude and Frequency of Floods on Rural Unregulated Streams in New York State, Excluding Long Island,
W80-04556 2E

Regional Drought and Flood Frequency Analysis: Theoretical Consideration,
W80-04618 6A

FLOOD FREQUENCY ANALYSIS
Regional Drought and Flood Frequency Analysis: Theoretical Consideration,
W80-04618 6A

FLOOD PLAIN MANAGEMENT
Analysis of Structural and Nonstructural Flood Control Measures Using Computer Program HEC-5C,
W80-04772 6A

FLOOD PLAIN ZONING
Flood Hazard Study Tallasseehatchee Creek and Tributaries in Vicinity of Jacksonville, Alabama.
W80-04611 2E

FLOOD PLAINS
Welsh Floodplain Studies, II. Application of a Qualitative Inundation Model,
W80-04511 2E

FLOOD PROFILES
Flood Hazard Study Tallasseehatchee Creek and Tributaries in Vicinity of Jacksonville, Alabama.
W80-04611 2E

FLOODPROOFING
Estimating Costs and Benefits for Nonstructural Flood Control Measures,
W80-04769 6F

FLOODS
Welsh Floodplain Studies, II. Application of a Qualitative Inundation Model,
W80-04511 2E

Floods in Georgia, Magnitude and Frequency,
W80-04546 2E

Maine Coastal Storm and Flood of February 2, 1976,
W80-04553 2E

Techniques for Estimating Magnitude and Frequency of Floods on Rural Unregulated Streams in New York State, Excluding Long Island,
W80-04556 2E

FLORIDA
Aquifer Coefficients Determined from Multiple Well Effects, Fernandina Beach, Florida,
W80-04554 2F

Estimated Water Use in Florida, 1977,
W80-04557 6D

Nitrogen and Water Distributions in Fertilized Sandy Soil During Irrigation and Drainage,
W80-04642 2G

Water Use and Supply Development Plan--Executive Summary.
W80-04746 4A

FLOW CHARACTERISTICS
Turbulence Prediction in Open Channel Flow,
W80-04645 2E

FLOW DURATION
Statistical Summary of Streamflow Data for Kansas Streams in the Missouri River Basin,
W80-04550 2E

FLOW MEASUREMENT
A Simple Digital Rate-Meter for Current Meters (Note),
W80-04537 7B

FLY ASH
Solubility of Selected Major and Minor Elements from Coal, Gob and Fly Ash Accumulations,
W80-04604 5B

FOOD CHAINS
Radioactive Contamination of the Aquatic Food-Chain and Consequent Risk to Man,
W80-04734 5C

FOOD HABITS
Size-Selective Predation of Zooplankton,
W80-04655 5C

FOREST SOILS
Effect of Simulated Acid Rain on Sulfate Movement in Acid Forest Soils,
W80-04640 2B

FOREST WATERSHEDS
Effects of Wood Products Harvest on Forest Soil and Water Relations,
W80-04519 4C

FORESTRY
Effects of Slash Burial on Stream Water Quality,
W80-04517 5B

FORESTS
Rainfall Interception in a Forest Stand Estimated from Grassland Meteorological Data,
W80-04514 2A

Effects of Wood Products Harvest on Forest Soil and Water Relations,
W80-04519 4C

Precipitation Acidity: The Role of the Forest Canopy in Acid Exchange,
W80-04521 2K

Water-Quality Characteristics of Streams in Forested and Rural Areas of North Carolina,
W80-04558 5B

FRESH WATER FISH
Growth of Fish in Heated Environments,
W80-04688 5C

FRESHWATER FISH
Polychlorinated Biphenyls and Other Organic Chemical Residues in Fish From Major Watersheds of the United States, 1976,
W80-04706 5C

Acute Residual Toxicity of Several Disinfectants in Domestic and Industrial Waste Water,
W80-04717 5A

FRESHWATER MARSHES
The Effect of Sewage Effluent on the Structure and Function of a Freshwater Tidal Marsh Ecosystem,
W80-04674 5D

FUCUS
Effects of Seawater Suspensions of Iron Ore Dust on Fucus Oospheres,
W80-04693 5C

FUNGI
The Occurrence of a Hypersensitive Reaction in the Planktonic Diatom Asterionella Formosa

Hassall Parasitized by the Chytrid Rhizophydium Planktonicum Canter Emend., In Culture,
W80-04654 5C

GAME BIRDS
Pheasant Use of Wetlands During the Winter and Application of Landsat Imagery for Assessing Winter Habitat,
W80-04544 6G

GEOLOGIC HISTORY
The Estuary Revisited,
W80-04505 2L

GEOMORPHOLOGY
Sediment Discharge and Channel Change in the North Fork Teton River, 1977-78, Fremont and Madison Counties, Idaho,
W80-04562 2J

GEORGIA
Trifluralin Movement in Runoff from a Small Agricultural Watershed,
W80-04518 5B

Floods in Georgia, Magnitude and Frequency,
W80-04546 2E

GEOTHERMAL STUDIES
Diamond Compact Cutter Studies for Geothermal Bit Design,
W80-04531 8G

Role of Borehole Geophysics in Defining the Physical Characteristics of the Raft River Geothermal Reservoir, Idaho,
W80-04559 1A

Groundwater Characteristics and Corrosion Problems Associated with the Use of Geothermal Water in Klamath Falls, Oregon,
W80-04763 8G

Evaluation and Design of Downhole Heat Exchangers for Direct Application,
W80-04764 8C

Predicted Corrosion and Scale-Formation Properties of Geopressured Geothermal Waters from the Northern Gulf of Mexico Basin,
W80-04766 2K

Studies Aim at Optimum Design for PDC Hard-Formation Bits,
W80-04767 8C

GILA NATIONAL FOREST (NM)
Reserved Water Rights and Our National Forests,
W80-04754 6E

GLACIERS
Glacier Surveys in Alberta - 1977,
W80-04570 2C

GLYCERIA
Glyceria Maxima (Hartm.) Holmb. in Ponds Supplied with Post-Sewage Water,
W80-04730 5D

GOLD
Correlation and Prediction of Metal Toxicity to Aquatic Biota,
W80-04711 5A

GOVERNMENTAL INTERRELATIONS
Coastal Zone Management - A Federal Perspective,
W80-04583 6E

GRADIENTS (STREAMS)
The River Laxa Ecosystem, Iceland,
W80-04663 2E

GRAVELS
Design of Gravel Packs in Deviated Wellbores,
W80-04631 8A

Recent Sedimentation History of the Waimakariri River, New Zealand,
W80-04643 2J

GRAVITY WAVES
Long-Period Gravity Waves in Ice-Covered Sea,
W80-04634 2C

GRAZING
Fertilizer Nutrient Losses from Rangeland Watersheds in Central Oklahoma,
W80-04520 5B

Quantification of Non-Point Water Pollutants from Logging, Cattle Grazing, Mining, and Subdivision Activities,
W80-04669 5A

GREAT LAKES
The Management of International Boundary Waters of Canada and the United States: A Comparative Study,
W80-04777 6E

GREAT SALT LAKE
Hydrology and Surface Morphology of the Bonneville Salt Flats and Pilot Valley Playa, Utah,
W80-04563 2F

GREECE
Nips, Notches, and the Solution of Coastal Limestone: An Overview of the Problem with Examples from Greece,
W80-04628 2J

GREEN RIVER BASIN (KY)
The Green River Basin Routing Model,

MAUMEE RIVER BASIN (INDIANA)
Level-B Multiobjective Planning for Water and Land,
W80-04679 6A

MEASUREMENT
Measurement of Phytoplankton Growth by Particle Counting,
W80-04648 5A

MEMBRANE DAMAGE
The Effect of Water Pretreatment Chemicals on the Performance and Durability of Reverse Osmosis Membranes,
W80-04596 3A

MEMBRANE PROCESSES
The Effect of Water Pretreatment Chemicals on the Performance and Durability of Reverse Osmosis Membranes,
W80-04596 3A

MEMBRANES
The Effect of Water Pretreatment Chemicals on the Performance and Durability of Reverse Osmosis Membranes,
W80-04596 3A

MERCURY
Oxygen Content and Toxicity for Fish of Some Substances in Heated Waters,
W80-04681 5A

The Effects of Mercury Exposure on Intracellular Distribution of Mercury, Copper and Zinc in Skeletonema Costatum (Grev.) Cleve,
W80-04695 5B

METABOLISM
The Uptake of Urea by the Diatom, Phaeodactylum,
W80-04653 5C

METALS
Tissue Metal Concentrations in Two Crayfish Species Cohabiting a Tennessee Cave Stream,
W80-04696 5A

Uptake and Elimination of Antimony in the Mussel, Mytilus Edulis,
W80-04697 5C

Correlation and Prediction of Metal Toxicity to Aquatic Biota,
W80-04711 5A

Effects on Rainbow Trout (Salmo Gairdneri) of a Chronic Exposure to Waterborne Selenium,
W80-04714 5B

METHODOLOGY
Simple Field Methods for Estimating Soil Hydraulic Conductivity,
W80-04540 7B

A Simple Continuous-Flow Toxicant Delivery System,
W80-04707 5A

Comparison of the Toxicity Thresholds of Water Pollutants to Bacteria, Algae, and Protozoa in the Cell Multiplication Inhibition Test,
W80-04708 5A

Systems of Biological Indicators for Water Quality Assessment,
W80-04727 5C

A Marine Algal Bioassay Method: Results with Pesticides and Industrial Wastes,
W80-04740 5A

METHYL PARATHION
A Marine Algal Bioassay Method: Results with Pesticides and Industrial Wastes,
W80-04740 5A

MICHIGAN
Water Based Recreational Developments in Michigan - Problems of Developers,
W80-04591 6E

MICROBIAL DEGRADATION
Biodegradation of Thiocyanate by Microorganisms Isolated from Gas Liquor,
W80-04605 5D

MICROWAVES
Permittivity of Ice and Water at Millimeter Wavelengths,
W80-04635 2C

MIDDLE ATLANTIC BIGHT
Mixing Processes on the Atlantic Continental Shelf, Cape Cod to Cape Hatteras,
W80-04532 5B

MINERAL INDUSTRY
The Outer Continental Shelf Lands Act Amendments of 1978,
W80-04572 6E

Guarding the Treasures of the Deep: The Deep Seabed Hard Mineral Resources Act,
W80-04778 6E

MINERALOGY
Physical Properties of Confined Dredged Materials,
W80-04539 1B

MINERALS
Hydrogeochemical Processes Affecting the Migration of Radionuclides in a Fluvial Sand Aquifer at the Chalk River Nuclear Laboratories,
W80-04567 4B

MINING
From Caracas to Geneva to New York: The International Seabed Authority as a Creator of Grants,
W80-04590 6E

Quantification of Non-Point Water Pollutants from Logging, Cattle Grazing, Mining, and Subdivision Activities,
W80-04669 5A

MISSISSIPPI
Water Resources Data for Mississippi, Water Year 1978.
W80-04549 7C

MISSOURI RIVER BASIN (KANS)
Statistical Summary of Streamflow Data for Kansas Streams in the Missouri River Basin,
W80-04550 2E

MIXING
Mixing Processes on the Atlantic Continental Shelf, Cape Cod to Cape Hatteras,
W80-04532 5B

MODE OF ACTION
Three Types of Skin Papillomas of Flatfishes and Their Causes,
W80-04713 5A

MODEL STUDIES
Stochastic Synthesis of Hydrologic Data Based on Concepts of Pattern Recognition, I. General Methodology of the Approach,
W80-04510 2E

Welsh Floodplain Studies, II. Application of a Qualitative Inundation Model,
W80-04511 2E

Rainfall Interception in a Forest Stand Estimated from Grassland Meteorological Data,
W80-04514 2A

A Nonpoint Source Model for Land Areas Receiving Animal Wastes: III. A Conceptual Model for Sediment and Manure Transport,
W80-04515 5B

A Nonpoint Source Model for Land Areas Receiving Animal Wastes: IV. Model Inputs and Verification for Sediment and Manure Transport,
W80-04516 5B

USDAHL-74 Model as a Planning Tool,
W80-04529 2A

Calculation of the in Situ pH of Seawater,
W80-04533 2L

Probable Hydrologic Effects of a Hypothetical Failure of Mackay Dam on the Big Lost River Valley from Mackay, Idaho, to the Idaho National Engineering Laboratory,
W80-04551 6A

Stochastic Synthesis of Hydrologic Data Based on Concepts of Pattern Recognition, II. Application of Natural Watersheds,
W80-04612 2E

Stochastic Synthesis of Hydrologic Data Based on Concepts of Pattern Recognition, III. Performance Evaluation of the Methodology,
W80-04613 2E

A Practical Model for Linear and Nonlinear Runoff,
W80-04614 2E

Adaptive Fourier Analysis of Periodic-Stochastic Hydrologic Sequences,
W80-04616 2E

Critical Drought Analysis of Periodic-Stochastic Processes,
W80-04617 2E

Simulation of the Effects of Transpiration Losses from the Unsaturated Zone on Seepage from a Soil Slope,
W80-04620 2G

Effect of Climate and Temperature on the Amount of HC03(-) and H2C03 of Groundwaters (Influence du Climat, de la Temperature sur la Teneur en HC03(-) et H2C03 des Eaux Souterraines),
W80-04623 2F

A One-Dimensional Representation of Residual Currents in the Severn Estuary and Associated Observations,
W80-04630 2L

Long-Period Gravity Waves in Ice-Covered Sea,
W80-04634 2C

Turbulence Prediction in Open Channel Flow,
W80-04645 2E

A Contribution to the Phosphorus Loading Concept,
W80-04656 5C

Northern Lake Modeling: A Literature Review,
W80-04677 2H

Level-B Multiobjective Planning for Water and Land,
W80-04679 6A

Multi-Objective Analysis in Water Supply and Management Problems for a Single River Basin,
W80-04759 6A

MOISTURE CONTENT
Simple Field Methods for Estimating Soil Hydraulic Conductivity,
W80-04540 7B

The Active and Passive Microwave Response to Snow Parameters, 1. Wetness,
W80-04624 2C

The Active and Passive Microwave Response to Snow Parameters, 2. Water Equivalent of Dry Snow,
W80-04625 2C

MOLLUSKS
The Content of Certain Metals in the Soft Tissues of the Bivalve Mollusks Tridacna Squamosa from Islands of the Tropical Zone of the Pacific Ocean in Connection with Environmental Conditions,
W80-04698 5C

MOLYBDENUM
The Study of Eutrophication of Algal Benthos by Essential Metals in Artificial Rivers,
W80-04726 5A

MONITORING
A Comparison of Composite Sampling Techniques for Monitoring Runoff,
W80-04525 5B

MONTANA
The Effect of Altered Streamflow on the Hydrology and Geomorphology of the Yellowstone River Basin, Montana,
W80-04542 2A

Limnological Studies in Montana: Hyalite Reservoir and Responses of Lotic Periphyton to Deep-Water Discharges, Grazing and Logging,
W80-04670 4C

MONTMORILLONITE
Physical Properties of Soil Moisture,
W80-04606 2G

MORTALITY
Production, Mortality, and Power Plant Entrainment of Larval Yellow Perch in Western Lake Erie,
W80-04701 5A

Oil Pollution and Seabirds: Atlantic Canada 1976-77 and Some Implications for Northern Environments,
W80-04705 5C

Chlorotic Death of Lemna Gibba by Cadmium in Different Concentrations of Nutritional Minerals (In Japanese),
W80-04742 5A

MUD CREEK (KAN)
Measuring the Social Impacts of Water Resources Projects,
W80-04601 6B

MULTI-OBJECTIVE MODEL
Multi-Objective Analysis in Water Supply and Management Problems for a Single River Basin,
W80-04759 6A

MULTIPLE-PURPOSE PROJECTS
Level-B Multiobjective Planning for Water and Land,
W80-04679 6A

Water Resources Development by the U.S. Army Corps of Engineers in North Carolina.
W80-04770 6B

MUNICIPAL WASTES
The Municipal Program of the Clean Water Act: 1978 Administrative Implementation,
W80-04797 6E

MUSSELS
Uptake and Elimination of Antimony in the Mussel, Mytilus Edulis,
W80-04697 5C

Effects of Ammonia and Ammonium on Tolerance and Byssogenesis in Perna Viridis,
W80-04721 5C

MYRIOPHYLLUM SPICATUM
Comparative Carbohydrate Storage and Utilization Patterns in the Submersed Macrophytes, Myriophyllum Spicatum and Vallisneria Americana,
W80-04665 5B

NATIONAL FORESTS
Reserved Water Rights and Our National Forests,
W80-04754 6E

NAVIGABLE WATERS
Water Resources Development Act of 1978.
W80-04594 6E

Need for a Uniform Public - Private Boundary: Application of the High Water Boundary to Inland Navigable Lakes,
W80-04794 6E

NAVIGATION
Water Resources Development by the U.S. Army Corps of Engineers in North Carolina.
W80-04770 6B

NEBURON
A Marine Algal Bioassay Method: Results with Pesticides and Industrial Wastes,
W80-04740 5A

NEGOTIATIONS
Much Ado About Something - Dispute Settlement and the Law of the Sea Convention,
W80-04580 6E

NEMATODES
The Effect of Temperature on the Respiration Rate of Meiofauna,
W80-04703 5A

NEOPLASMS
Three Types of Skin Papillomas of Flatfishes and Their Causes,
W80-04713 5A

NEW MEXICO
Water Resources Data for New Mexico, Water Year 1978.
W80-04547 7C

Blue Lake: A Struggle for Indian Rights,
W80-04578 6E

NEW YORK
Techniques for Estimating Magnitude and Frequency of Floods on Rural Unregulated Streams in New York State, Excluding Long Island,
W80-04556 2E

NEW ZEALAND
Recent Sedimentation History of the Waimakariri River, New Zealand,
W80-04643 2J

Sediment Loads of North Island Rivers, New Zealand--A Reconnaissance,
W80-04644 2J

NITROGEN
Effects of Wetlands on Water Quality in the Devils Lake Basin, North Dakota,
W80-04607 4A

NON-STRUCTURAL ALTERNATIVES
Estimating Costs and Benefits for Nonstructural Flood Control Measures,
W80-04769 6F

Analysis of Structural and Nonstructural Flood Control Measures Using Computer Program HEC-5C,
W80-04772 6A

NON-VOLATILE COMPOUNDS
Urban Hydrology in Karst and Water Quality--Inorganic and Organic Systems,
W80-04597 4C

NORTH CAROLINA
Water-Quality Characteristics of Streams in Forested and Rural Areas of North Carolina,
W80-04558 5B

Water Resources Development by the U.S. Army Corps of Engineers in North Carolina.
W80-04770 6B

The Management of Land and Water Use in the Coastal Zone: A New Law is Enacted in North Carolina,
W80-04788 6E

NORTH DAKOTA
Ground-Water Basic Data for Ransom and Sargent Counties, North Dakota,
W80-04564 7C

Effects of Wetlands on Water Quality in the Devils Lake Basin, North Dakota,
W80-04607 4A

NORTH FORK TETON RIVER (IDAHO)
Sediment Discharge and Channel Change in the North Fork Teton River, 1977-78, Fremont and Madison Counties, Idaho,
W80-04562 2J

NORTH SEA
Continuous Plankton Records: Seasonal Cycles of Phytoplankton and Copepods in the North Atlantic Ocean and the North Sea,
W80-04652 5C

NUTRIENT REMOVAL
Fertilizer Nutrient Losses from Rangeland Watersheds in Central Oklahoma,
W80-04520 5B

Phosphorus Variations in Surface Runoff from Agricultural Lands as a Function of Land Use,
W80-04523 5B

Radio-Manganese, -Iron, and -Phosphorus Uptake by Water Hyacinth and Economic Implications,
W80-04649 2I

The Effect of Sewage Effluent on the Structure and Function of a Freshwater Tidal Marsh Ecosystem,
W80-04674 5D

NUTRIENT REQUIREMENTS
Comparative Carbohydrate Storage and Utilization Patterns in the Submersed Macrophytes, Myriophyllum Spicatum and Vallisneria Americana,
W80-04665 5B

NUTRIENTS
Nitrogen and Water Distributions in Fertilized Sandy Soil During Irrigation and Drainage,
W80-04642 2G

OCEAN CIRCULATION
Longshore Pressure Gradients Caused by Offshore Wind,
W80-04626 2L

OCEANS
Vessel-Source Oil Pollution: Legal, Administrative and Technical Aspects of a Global Environmental Problem,
W80-04799 6E

OFFSHORE WIND
Longshore Pressure Gradients Caused by Offshore Wind,
W80-04626 2L

OIL
The Combined Effect of Salinity, Temperature and Oil on the Growth Pattern of Embryos of the Killifish, Fundulus Heteroclitus Walbaum,
W80-04737 5A

OIL FIELDS
The Outer Continental Shelf Lands Act Amendments of 1978: Balancing Energy Needs with Environmental Concerns,
W80-04793 6E

OIL INDUSTRY
The Outer Continental Shelf Lands Act Amendments of 1978,
W80-04572 6E

OIL POLLUTION
Government Regulation of Oil Polluters: How Much is Enough,
W80-04579 6E

The Outer Continental Shelf Lands Act Amendments of 1978: Balancing Energy Needs with Environmental Concerns,
W80-04793 6E

OIL SPILLS
Oil Pollution and Seabirds: Atlantic Canada 1976-77 and Some Implications for Northern Environments,
W80-04705 5C

Responses of Salt Marsh Vegetation to Oil Spills and Refinery Effluents,
W80-04743 5C

Vessel-Source Oil Pollution: Legal, Administrative and Technical Aspects of a Global Environmental Problem,
W80-04799 6E

OILSEED CROPS
Jojoba: An Alternative to the Conflict Between Agricultural and Municipal Ground Water Requirements in the Tucson Area, Arizona,
W80-04667 3F

OKLAHOMA
Fertilizer Nutrient Losses from Rangeland Watersheds in Central Oklahoma,
W80-04520 5B

Intergovernmental Aspects of Water Transfer in Identification and Assessment of Federal and Interstate Issues and Constraints,
W80-04602 6E

ON-SITE INVESTIGATIONS
Broad-Crested Weirs for Portable Flow Metering,
W80-04527 8A

Construction and Performance of Large Automatic (Nonweighing) Lysimeters,
W80-04528 2D

ON-SITE TESTS
Studies Aim at Optimum Design for PDC Hard-Formation Bits,
W80-04767 8C

OPEN CHANNEL FLOW
Debris Flow on Prismatic Open Channel,
W80-04535 2E

Turbulence Prediction in Open Channel Flow,
W80-04645 2E

OPTIMIZATION
Optimizing Flood Operation Rules,
W80-04501 6A

ORGANIC COMPOUNDS
Urban Hydrology in Karst and Water Quality--Inorganic and Organic Systems,
W80-04597 4C

Analysis of Rivers and Streams of Southern Missouri for EPA Priority Pollutants Using Liquid Chromatography,
W80-04598 5A

ORGANIC WASTES
Prevent Ground Water Contamination Before It's too Late,
W80-04666 5B

ORTHOPHOSPHATE
A Contribution to the Phosphorus Loading Concept,
W80-04656 5C

OSMOREGULATION
Some Effects of Salinity and Temperature on the Osmotic and Ionic Regulation of Praunus Flexuosus (Crustacea, Mysidacea) from Isefjord,
W80-04729 5B

Osmotic Responses of Eggs and Larvae of the Pacific Herring to Salinity and Cadmium,
W80-04733 5B

OSMOSIS
Some Effects of Salinity and Temperature on the Osmotic and Ionic Regulation of Praunus Flexuosus (Crustacea, Mysidacea) from Isefjord,
W80-04729 5B

OUTDOOR RECREATION
Planning Undeveloped Lakeshore: A Case Study on Lake Champlain, Ferrisburg, Vermont,
W80-04760 6B

OWNERSHIP OF BEDS
Property Rights: Intertribal Mineral Rights in the Arkansas Riverbed,
W80-04577 6E

OXYGEN
The Oxygen Balance of Lake Myvatn, Iceland,
W80-04661 5C

OXYGEN DEPLETION
Factors Controlling Oxygen Depletion in Ice-Covered Lakes,
W80-04712 5A

PACIFIC OCEAN
The Content of Certain Metals in the Soft Tissues of the Bivalve Mollusks Tridacna Squamosa from Islands of the Tropical Zone of the Pacific Ocean in Connection with Environmental Conditions,
W80-04698 5C

PAPILLOMAS
Three Types of Skin Papillomas of Flatfishes and Their Causes,
W80-04713 5A

PARALYTIC SHELLFISH POISONING
Toxic Dinoflagellates and Tidal Power Generation in the Bay of Fundy, Canada,
W80-04704 5A

PARASITISM
The Occurrence of a Hypersensitive Reaction in the Planktonic Diatom Asterionella Formosa Hassall Parasitized by the Chytrid Rhizophydium Planktonicum Canter Emend., In Culture,
W80-04654 5C

PARTICLE SIZE
Measurement of Phytoplankton Growth by Particle Counting,
W80-04648 5A

Size-Selective Predation of Zooplankton,
W80-04655 5C

PASTURES
Impact of Unconfined Livestock Activities on Water Quality,
W80-04526 5B

PEAK DISCHARGE
Floods in Georgia, Magnitude and Frequency,
W80-04546 2E

Techniques for Estimating Magnitude and Frequency of Floods on Rural Unregulated Streams in New York State, Excluding Long Island,
W80-04556 2E

A Practical Model for Linear and Nonlinear Runoff,
W80-04614 2E

PEERLESS LAKE (ALBERTA)
Hydrogeology of the Peerless Lake Area, Alberta,
W80-04646 7C

PENZE ESTUARY (FRANCE)
Short-Term Variations in Phytoplankton Biomass in a Tidal Estuary in Northern Brittany,
W80-04633 2L

PERCHED WATER
Hydrology of the Nahanni Karst, Northern Canada, and the Importance of Extreme Summer Storms,
W80-04513 2A

PERIPHYTON
Using Artificial Streams to Evaluate Perturbation Effects on Aufwuchs Structure and Function,
W80-04718 5A

PERMETHRIN
A Marine Algal Bioassay Method: Results with Pesticides and Industrial Wastes,
W80-04740 5A

PERMITS
The Inland Wetlands Act: Reconciling a Collision of Interests,
W80-04576 6E

Coastal Zone Management - A New Approach in California,
W80-04586 6E

PERNA
Effects of Ammonia and Ammonium on Tolerance and Byssogenesis in Perna Viridis,
W80-04721 5C

PERSISTENCE
Persistence of Fluridone in Small Ponds,
W80-04524 5B

PESTICIDE RESIDUES
Polychlorinated Biphenyls and Other Organic Chemical Residues in Fish From Major Watersheds of the United States, 1976,
W80-04706 5C

The Use of Isaza (Chaenogobius Isaza Tanaka) to Study the PCB Pollution (In Japanese),
W80-04741 5C

PESTICIDE TOXICITY
Kepone Effects on Larval Development of Mud-Crab and Blue-Crab,
W80-04739 5C

A Marine Algal Bioassay Method: Results with Pesticides and Industrial Wastes,
W80-04740 5A

PHEASANT
Pheasant Use of Wetlands During the Winter and Application of Landsat Imagery for Assessing Winter Habitat,
W80-04544 6G

PHENOL
Oxygen Content and Toxicity for Fish of Some Substances in Heated Waters,
W80-04681 5A

PHENOLS
A Comparison of Tolerance to Phenol Exhibited by Aquatic Insects and Arachnida During Ontogenesis,
W80-04724 5C

PHORATE
A Marine Algal Bioassay Method: Results with Pesticides and Industrial Wastes,
W80-04740 5A

PHOSPHORUS
Phosphorus Variations in Surface Runoff from Agricultural Lands as a Function of Land Use,
W80-04523 5B

Phosphate Removal from Industrial and Municipal Wastewater,
W80-04543 5D

Effects of Wetlands on Water Quality in the Devils Lake Basin, North Dakota,
W80-04607 4A

Radio-Manganese, -Iron, and -Phosphorus Uptake by Water Hyacinth and Economic Implications,
W80-04649 2I

PHOTOGRAMMETRY
Glacier Surveys in Alberta - 1977,
W80-04570 2C

PHOTOSYNTHESIS
Photosynthesis and Growth of Spirulina Platensis (Cyanophyta) in an Equatorial Lake (Lake Simbi, Kenya),
W80-04647 5C

PHYSICAL PROCESSES
Design of Wastewater Treatment Facilities, Major Systems.
W80-04773 8A

PHYSICAL PROPERTIES
Physical Properties of Confined Dredged Materials,
W80-04539 1B

PHYSIOC-CHEMICAL PROPERTIES
Correlation and Prediction of Metal Toxicity to Aquatic Biota,
W80-04711 5A

PHYTOPLANKTON
Short-Term Variations in Phytoplankton Biomass in a Tidal Estuary in Northern Brittany,
W80-04633 2L

Measurement of Phytoplankton Growth by Particle Counting,
W80-04648 5A

Continuous Plankton Records: Seasonal Cycles of Phytoplankton and Copepods in the North Atlantic Ocean and the North Sea,
W80-04652 5C

Phytoplankton Production in Shallow Eutrophic Lake Myvatn, Iceland,
W80-04664 5C

PILOT VALLEY (UTAH)
Hydrology and Surface Morphology of the Bonneville Salt Flats and Pilot Valley Playa, Utah,
W80-04563 2F

PLANNING
USDAHL-74 Model as a Planning Tool,
W80-04529 2A

Level-B Multiobjective Planning for Water and Land,
W80-04679 6A

Water Use and Supply Development Plan--Executive Summary.
W80-04746 4A

A Systems Resources Approach to Citizen Participation: The Case of the Corps of Engineers,
W80-04756 6E

Planning Undeveloped Lakeshore: A Case Study on Lake Champlain, Ferrisburg, Vermont,
W80-04760 6B

Coordinating Land and Water Use Planning for Sound Resource Management,
W80-04761 6E

Analysis of Structural and Nonstructural Flood Control Measures Using Computer Program HEC-5C,
W80-04772 6A

PLANT GROWTH
Growth and Longevity in the Crustose Red Alga Petrocelis Middendorffii,
W80-04651 5C

PLANT GROWTH REGULATORS
Comparative Carbohydrate Storage and Utilization Patterns in the Submersed Macrophytes, Myriophyllum Spicatum and Vallisneria Americana,
W80-04665 5B

PLANT PHYSIOLOGY
Radio-Manganese, -Iron, and -Phosphorus Uptake by Water Hyacinth and Economic Implications,
W80-04649 2I

PLAYAS
Hydrology and Surface Morphology of the Bonneville Salt Flats and Pilot Valley Playa, Utah,
W80-04563 2F

POLAND
Lethal Temperatures for Fish,
W80-04682 5A

Behaviour of Fish in a Thermally Differentiated Environment,
W80-04683 5C

Fish Metabolism,
W80-04684 5A

Sexual Maturity of Fish in Heated Waters,
W80-04685 5C

Spawning of Fish and Their Embryonic and Larval Development,
W80-04686 5C

Growth of Fish in Heated Environments,
W80-04688 5C

Changes of Fish Communities in Heated Environments,
W80-04690 5C

The Impact on Ichthyofauna and Possible Control of the Effects of Thermal Discharge,
W80-04691 5A

POLITICAL ASPECTS
Environmental Improvement Through Economic Incentives,
W80-04752 6E

POLJES
Hydrology of the Nahanni Karst, Northern Canada, and the Importance of Extreme Summer Storms,
W80-04513 2A

POLLUTANTS
A Comparison of Composite Sampling Techniques for Monitoring Runoff,
W80-04525 5B

Storm Water Management Model Verification - Hamilton Test Catchment.
W80-04566 5A

Urban Hydrology in Karst and Water Quality--Inorganic and Organic Systems,
W80-04597 4C

Analysis of Rivers and Streams of Southern Missouri for EPA Priority Pollutants Using Liquid Chromatography,
W80-04598 5A

POLLUTION
Environmental Improvement Through Economic Incentives,
W80-04752 6E

POLLUTION ABATEMENT
Environmental Improvement Through Economic Incentives,
W80-04752 6E

Preventing Groundwater Pollution: Towards a Coordinated Strategy to Protect Critical Recharge Zones,
W80-04800 6E

POLLUTION CONTROL
Environmental Improvement Through Economic Incentives,
W80-04752 6E

POLLUTION TAXES (CHARGES)
Environmental Improvement Through Economic Incentives,
W80-04752 6E

POLYCHAETES
The Effect of Temperature on the Respiration Rate of Meiofauna,
W80-04703 5A

POLYCHLORINATED BIPHENYLS
Polychlorinated Biphenyls and Other Organic Chemical Residues in Fish From Major Watersheds of the United States, 1976,
W80-04706 5C

The Use of Isaza (Chaenogobius Isaza Tanaka) to Study the PCB Pollution (In Japanese),
W80-04741 5C

POLYMERS
Soil-Water Retention, Transmission, and Quality of Leachate from Polymer-Treated Soils, Effects of the In Situ Crosslinking,
W80-04609 2G

PONDS
Persistence of Fluridone in Small Ponds,
W80-04524 5B

POTABLE WATER
Guidelines for Surface Water Quality, Vol. 1, Inorganic Chemical Substances, Selenium,
W80-04568 5C

Guidelines for Surface Water Quality, Vol 1, Inorganic Chemical Substances, Nickel,
W80-04571 5C

POWERPLANTS
The River Laxa Ecosystem, Iceland,
W80-04663 2E

Production, Mortality, and Power Plant Entrainment of Larval Yellow Perch in Western Lake Erie,
W80-04701 5A

A Comparison of Populations of the Isopod Asellus Aquaticus Above and Below Power Stations in Organically Polluted Reaches of the River Trent,
W80-04732 5C

PRECIPITATION (ATMOSPHERIC)
Weather Modification: Winners and Losers,
W80-04508 3B

Precipitation Acidity: The Role of the Forest Canopy in Acid Exchange,
W80-04521 2K

PREDATION
Size-Selective Predation of Zooplankton,
W80-04655 5C

PREFERRED TEMPERATURE
Behaviour of Fish in a Thermally Differentiated Environment,
W80-04683 5C

PRIMARY PRODUCTIVITY
The Oxygen Balance of Lake Myvatn, Iceland,
W80-04661 5C

Phytoplankton Production in Shallow Eutrophic Lake Myvatn, Iceland,
W80-04664 5C

PRIOR APPROPRIATION
Report to Governor John A. Love on Certain Colorado Water Law Problems,
W80-04798 6E

PROBABILITY
Probable Hydrologic Effects of a Hypothetical Failure of Mackay Dam on the Big Lost River Valley from Mackay, Idaho, to the Idaho National Engineering Laboratory,
W80-04551 6A

A Generalized Probability Density Function for Double-Bounded Random Processes,
W80-04615 2B

PUBLIC ACCESS
Use It and Lose It - Surface Water Rights in Idaho,
W80-04573 6E

Water Based Recreational Developments in Michigan - Problems of Developers,
W80-04591 6E

PUBLIC HEALTH
Public Health Aspects of Land Disposal of Sugar Refining Wastes by Spray Irrigation,
W80-04608 5B

Prevent Ground Water Contamination Before It's too Late,
W80-04666 5B

Radioactive Contamination of the Aquatic Food-Chain and Consequent Risk to Man,
W80-04734 5C

PULP WASTES
Influence of Secondarily Treated Kraft Mill Effluent on the Accumulation Rate of Attached Algae in Experimental Continuous-Flow Troughs,
W80-04715 5C

RADIOACTIVE WASTES
Borehole Geophysics as Applied to the Management of Radioactive Waste -- Site Selection and Monitoring,
W80-04561 5E

Hydrogeochemical Processes Affecting the Migration of Radionuclides in a Fluvial Sand Aquifer at the Chalk River Nuclear Laboratories,
W80-04567 4B

RADIOISOTOPES
Radioactive Contamination of the Aquatic Food-Chain and Consequent Risk to Man,
W80-04734 5C

RADIONUCLIDES
Hydrogeochemical Processes Affecting the Migration of Radionuclides in a Fluvial Sand Aquifer at the Chalk River Nuclear Laboratories,
W80-04567 4B

RAIN GAGES
Instantaneous Rainfall Rate: Its Measurement and Its Influence on High-Voltage Transmission Lines,
W80-04538 7B

RAINBOW TROUT
Effects on Rainbow Trout (Salmo Gairdneri) of a Chronic Exposure to Waterborne Selenium,
W80-04714 5B

Effects of Dietary Ascorbic Acid on Chronic Lead Toxicity to Young Rainbow Trout (Salmo Gairdneri),
W80-04720 5A

RAINFALL
Rainfall Interception in a Forest Stand Estimated from Grassland Meteorological Data,
W80-04514 2A

Instantaneous Rainfall Rate: Its Measurement and Its Influence on High-Voltage Transmission Lines,
W80-04538 7B

RAINFALL INTENSITY
Instantaneous Rainfall Rate: Its Measurement and Its Influence on High-Voltage Transmission Lines,
W80-04538 7B

RAINFALL RATE
Storm Water Management Model Verification - Hamilton Test Catchment.
W80-04566 5A

RANGE MANAGEMENT
Fertilizer Nutrient Losses from Rangeland Watersheds in Central Oklahoma,
W80-04520 5B

RECLAIMED WATER
The Long Island Experience with Water Retention and Recharge Management,
W80-04545 4B

RECREATION
River Amenity Evaluation: A Review and Commentary,
W80-04758 6B

Planning Undeveloped Lakeshore: A Case Study on Lake Champlain, Ferrisburg, Vermont,
W80-04760 6B

REGIONAL DROUGHT
Regional Drought and Flood Frequency Analysis: Theoretical Consideration,
W80-04618 6A

REGULATION
Government Regulation of Oil Polluters: How Much is Enough,
W80-04579 6E

Estimating Costs and Benefits for Nonstructural Flood Control Measures,
W80-04769 6F

RELOCATION
Estimating Costs and Benefits for Nonstructural Flood Control Measures,
W80-04769 6F

REMEDIES
Once-Released Irrigation Waters: Liability and Litigation,
W80-04789 6E

REMOTE SENSING
The Active and Passive Microwave Response to Snow Parameters, 1. Wetness,
W80-04624 2C

The Active and Passive Microwave Response to Snow Parameters, 2. Water Equivalent of Dry Snow,
W80-04625 2C

REPRODUCTION
Effects of Seawater Suspensions of Iron Ore Dust on Fucus Oospheres,
W80-04693 5C

RESEARCH AND DEVELOPMENT
Water Research and Development Act of 1978 - Legislative History.
W80-04592 6E

Water Research and Development Act of 1978.
W80-04593 6E

RESEARCH EQUIPMENT
A Simple Continuous-Flow Toxicant Delivery System,
W80-04707 5A

A Pressurized Proportional Diluter for Aquatic Toxicological Studies,
W80-04709 5A

RESERVOIR OPERATION
Optimizing Flood Operation Rules,
W80-04501 6A

The Green River Basin Routing Model,
W80-04744 6A

RESERVOIR STORAGE
Hybrid Energy System: Wind and Water,
W80-04502 8C

RESERVOIRS
Zooplankton as an Indicator of Pollution of Reservoirs,
W80-04716 5C

RESISTANCE
The Occurrence of a Hypersensitive Reaction in the Planktonic Diatom Asterionella Formosa Hassall Parasitized by the Chytrid Rhizophydium Planktonicum Canter Emend., In Culture,
W80-04654 5C

RESOURCE DEVELOPMENT
Environmental Law (Resource Utilization, Water Pollution and Air Pollution),
W80-04582 6E

RESOURCES
Environmental Improvement Through Economic Incentives,
W80-04752 6E

RESOURCES DEVELOPMENT
The Outer Continental Shelf Lands Act Amendments of 1978,
W80-04572 6E

Coastal Zone Management - A New Approach in California,
W80-04586 6E

Guarding the Treasures of the Deep: The Deep Seabed Hard Mineral Resources Act,
W80-04778 6E

Musing on the Bottom: Economic and Legal Implications of the United States' Proposed Draft United Nations Convention on the International Seabed,
W80-04782 6E

The Outer Continental Shelf Lands Act Amendments of 1978: Balancing Energy Needs with Environmental Concerns,
W80-04793 6E

RESPIRATION
The Effect of Temperature on the Respiration Rate of Meiofauna,
W80-04703 5A

Respiratory Properties of Erythrocruorin (Extracellular Hemoglobin) in the Blood of the Annelid Arenicola Marina with Special Reference to the Influences of Salinity and Temperature,
W80-04728 5B

RESPONSE FUNCTIONS
Response Functions Applied to a Drainage System,
W80-04530 2G

RETENTION
The Long Island Experience with Water Retention and Recharge Management,
W80-04545 4B

REVERSE OSMOSIS
Desalting: An Offer You May Not Refuse,
W80-04509 3A

The Effect of Water Pretreatment Chemicals on the Performance and Durability of Reverse Osmosis Membranes,
W80-04596 3A

REVIEWS
Northern Lake Modeling: A Literature Review,
W80-04677 2H

RHODOPHYTA
Growth and Longevity in the Crustose Red Alga Petrocelis Middendorffii,
W80-04651 5C

RIPARIAN LAND
Enforcing the Federal Water Resource Servitude on Submerged and Riparian Lands,
W80-04781 6E

RIPARIAN RIGHTS
A State of Knowledge on Indian Water Rights in Kansas,
W80-04503 6E

Special Considerations Involving Indian Rights,
W80-04574 6E

RIPARIAN WATERS
Dams and Wildlife,
W80-04678 2I

RIVER BASIN DEVELOPMENT
Property Rights: Intertribal Mineral Rights in the Arkansas Riverbed,
W80-04577 6E

RIVER BASINS
The Effect of Altered Streamflow on the Hydrology and Geomorphology of the Yellowstone River Basin, Montana,
W80-04542 2A

Multi-Objective Analysis in Water Supply and Management Problems for a Single River Basin,
W80-04759 6A

Water Resources Development by the U.S. Army Corps of Engineers in North Carolina.
W80-04770 6B

RIVER ESTHETIC ASSESSMENT
River Amenity Evaluation: A Review and Commentary,
W80-04758 6B

RIVER FLOW
Sediment Discharge and Channel Change in the North Fork Teton River, 1977-78, Fremont and Madison Counties, Idaho,
W80-04562 2J

Critical Drought Analysis of Periodic-Stochastic Processes,
W80-04617 2E

IVER FORECASTING
The Green River Basin Routing Model,
W80-04744 6A

IVER LAXA (ICELAND)
The Chemistry of Lake Myvatn and River Laxa,
W80-04657 5C

The River Laxa Ecosystem, Iceland,
W80-04663 2E

IVER RESOURCE ASSESSMENT
River Amenity Evaluation: A Review and Commentary,
W80-04758 6B

IVERS
Welsh Floodplain Studies, II. Application of a Qualitative Inundation Model,
W80-04511 2E

Adaptive Fourier Analysis of Periodic-Stochastic Hydrologic Sequences,
W80-04616 2E

The River Laxa Ecosystem, Iceland,
W80-04663 2E

The Study of Eutrophication of Algal Benthos by Essential Metals in Artificial Rivers,
W80-04726 5A

River Amenity Evaluation: A Review and Commentary,
W80-04758 6B

IVERS AND HARBORS ACT
Enforcing the Federal Water Resource Servitude on Submerged and Riparian Lands,
W80-04781 6E

Wreck Removal; Statutory Restrictions; Rivers and Harbors Act,
W80-04795 6E

UNOFF
Trifluralin Movement in Runoff from a Small Agricultural Watershed,
W80-04518 5B

A Comparison of Composite Sampling Techniques for Monitoring Runoff,
W80-04525 5B

USDAHL-74 Model as a Planning Tool,
W80-04529 2A

Effects of Wetlands on Water Quality in the Devils Lake Basin, North Dakota,
W80-04607 4A

A Practical Model for Linear and Nonlinear Runoff,
W80-04614 2E

Planting Wheel Traffic Effects on Interrow Runoff and Infiltration,
W80-04641 2G

RUNOFF QUALITY
Storm Water Management Model Verification - Hamilton Test Catchment.
W80-04566 5A

RURAL AREAS
Water-Quality Characteristics of Streams in Forested and Rural Areas of North Carolina,
W80-04558 5B

SALINITY
Effects of Temperature and Salinity on Larval Development of Pagurus Bernhardus (Decapoda, Paguridae),
W80-04722 5A

Respiratory Properties of Erythrocruorin (Extracellular Hemoglobin) in the Blood of the Annelid Arenicola Marina with Special Reference to the Influences of Salinity and Temperature,
W80-04728 5B

Some Effects of Salinity and Temperature on the Osmotic and Ionic Regulation of Praunus Flexuosus (Crustacea, Mysidacea) from Isefjord,
W80-04729 5B

Osmotic Responses of Eggs and Larvae of the Pacific Herring to Salinity and Cadmium,
W80-04733 5B

SALMON
Behaviour of Fish in a Thermally Differentiated Environment,
W80-04683 5C

SALMONELLA
Public Health Aspects of Land Disposal of Sugar Refining Wastes by Spray Irrigation,
W80-04608 5B

SALMONIDS
Toxicity of Butoxyethyl Ester of 2,4-D to Selected Salmon and Trout,
W80-04700 5A

SALT MARSHES
Responses of Salt Marsh Vegetation to Oil Spills and Refinery Effluents,
W80-04743 5C

SALT TOLERANCE
The Effects of Acclimation on the Salinity Tolerance of Grass Carp, Ctenopharyngodon Idella (Cuv. and Val.),
W80-04735 5C

SAMPLING
A Comparison of Composite Sampling Techniques for Monitoring Runoff,
W80-04525 5B

SAND PILLOWS
The Evaluation of a Synthetic Material for Use as a Wave Protection Agent on Irrigation Dams,
W80-04599 8G

SCALING
Predicted Corrosion and Scale-Formation Properties of Geopressured Geothermal Waters from the Northern Gulf of Mexico Basin,
W80-04766 2K

SCALLOP
Cadmium Toxicity to Three Species of Estuarine Invertebrates,
W80-04736 5A

SEA ICE
Long-Period Gravity Waves in Ice-Covered Sea,
W80-04634 2C

Crystal Alignments in the Fast Ice of Arctic Alaska,
W80-04636 2C

SEA WATER
Calculation of the in Situ pH of Seawater,
W80-04533 2L

SEASONAL
Continuous Plankton Records: Seasonal Cycles of Phytoplankton and Copepods in the North Atlantic Ocean and the North Sea,
W80-04652 5C

SEAWEEDS
Studies on the Binding of Heavy Metals to Algal Polysaccharides from Philippine Seaweeds. I. Carrageenan and the Binding of Lead and Cadmium,
W80-04694 5B

SECONDARY PRODUCTIVITY
Secondary Production of Epilithic Fauna in a Woodland Stream,
W80-04658 5C

SEDIMENT DISCHARGE
Sediment Discharge and Channel Change in the North Fork Teton River, 1977-78, Fremont and Madison Counties, Idaho,
W80-04562 2J

SEDIMENT LOAD
Computation of Bed Load Using Bathymetric Data,
W80-04534 2J

SEDIMENT TRANSPORT
Debris Flow on Prismatic Open Channel,
W80-04535 2E

Chemical Tracers for Particle Transport in the Chesapeake Bay,
W80-04632 5B

SEDIMENTATION
Effects of Changes in Drainage-Basin Boundaries on Sedimentation in Eocene Lakes Gosiute and Uinta of Wyoming, Utah, and Colorado,
W80-04541 2J

Recent Sedimentation History of the Waimakariri River, New Zealand,
W80-04643 2J

SEDIMENTS
A Nonpoint Source Model for Land Areas Receiving Animal Wastes: III. A Conceptual Model for Sediment and Manure Transport,
W80-04515 5B

A Nonpoint Source Model for Land Areas Receiving Animal Wastes: IV. Model Inputs and Verification for Sediment and Manure Transport,
W80-04516 5B

Hydrogeochemical Processes Affecting the Migration of Radionuclides in a Fluvial Sand Aquifer at the Chalk River Nuclear Laboratories,
W80-04567 4B

An Environmental Study of the Origin, Distribution, and Bioaccumulation of Selenium in Kentucky and Barkley Lakes,
W80-04672 5B

SEEPAGE
Simulation of the Effects of Transpiration Losses from the Unsaturated Zone on Seepage from a Soil Slope,
W80-04620 2G

SEEPAGE CONTROL
Once-Released Irrigation Waters: Liability and Litigation,
W80-04789 6E

SELENIUM
Correlation and Prediction of Metal Toxicity to Aquatic Biota,
W80-04711 5A

Effects on Rainbow Trout (Salmo Gairdneri) of a Chronic Exposure to Waterborne Selenium,
W80-04714 5B

SEVERN ESTUARY (ENGLAND)
A One-Dimensional Representation of Residual Currents in the Severn Estuary and Associated Observations,
W80-04630 2L

SEWAGE EFFLUENTS
Effects of Urban Runoff and Treated Municipal Wastewater on a Man-Made Channel in Northeastern Illinois,
W80-04710 5C

SEWAGE SYSTEMS
Interceptor Sewers and Urban Sprawl,
W80-04751 5D

SEWAGE TREATMENT
The Effect of Sewage Effluent on the Structure and Function of a Freshwater Tidal Marsh Ecosystem,
W80-04674 5D

Response of Biological Reactors to the Addition of Powered Activated Carbon,
W80-04680 5C

SEWERS
Interceptor Sewers and Urban Sprawl,
W80-04751 5D

SHALLOW WELLS
Evaluation and Design of Downhole Heat Exchangers for Direct Application,
W80-04764 8C

SHELLFISH
Toxic Dinoflagellates and Tidal Power Generation in the Bay of Fundy, Canada,
W80-04704 5A

SHIPWRECK REMOVAL
Wreck Removal; Statutory Restrictions; Rivers and Harbors Act,
W80-04795 6E

SHORE PROTECTION
Congress and Coastal Zone Management,
W80-04584 6E

Shoreland Zoning in Maine,
W80-04585 6E

Planning Undeveloped Lakeshore: A Case Study on Lake Champlain, Ferrisburg, Vermont,
W80-04760 6B

Coastal Controls in California: Wave of the Future,
W80-04779 6E

The Coastal Zone Management Act Amendments of 1976,
W80-04784 6E

Current Environmental Law: Taking or Regulation,
W80-04786 6E

The Management of Land and Water Use in the Coastal Zone: A New Law is Enacted in North Carolina,
W80-04788 6E

SHRIMP
Cadmium Toxicity to Three Species of Estuarine Invertebrates,
W80-04736 5A

SINKS
Hydrology of the Nahanni Karst, Northern Canada, and the Importance of Extreme Summer Storms,
W80-04513 2A

SKELETONEMA
The Effects of Mercury Exposure on Intracellular Distribution of Mercury, Copper and Zinc in Skeletonema Costatum (Grev.) Cleve,
W80-04695 5B

SKELETONEMA COSTATUM
Chlorophyll Turnover in Skeletonema Costatum, a Marine Plankton Diatom,
W80-04659 5B

SLOPE PROTECTION
The Evaluation of a Synthetic Material for Use as a Wave Protection Agent on Irrigation Dams,
W80-04599 8G

SNAILS
Variables Affecting Body Burdens of Lead, Zinc and Cadmium in a Roadside Population of the Snail Cepaea Hortensis Muller,
W80-04702 5C

SNOW
The Active and Passive Microwave Response to Snow Parameters, 1. Wetness,
W80-04624 2C

The Active and Passive Microwave Response to Snow Parameters, 2. Water Equivalent of Dry Snow,
W80-04625 2C

SOCIAL IMPACT
Measuring the Social Impacts of Water Resources Projects,
W80-04601 6B

SOIL AMENDMENTS
Soil-Water Retention, Transmission, and Quality of Leachate from Polymer-Treated Soils, Effects of the In Situ Crosslinking,
W80-04609 2G

SOIL CONSERVATION
Soil Conservation and Water Pollution Control: The Muddy Record of the United States Department of Agriculture,
W80-04791 6E

SOIL EROSION
Soil Conservation and Water Pollution Control: The Muddy Record of the United States Department of Agriculture,
W80-04791 6E

SOIL MOISTURE
Physical Properties of Soil Moisture,
W80-04606 2G

SOIL MOISTURE METERS
An Automatic Electrical Resistance Soil-Moisture Measuring System,
W80-04622 2G

SOIL PHYSICAL PROPERTIES
Simple Field Methods for Estimating Soil Hydraulic Conductivity,
W80-04540 7B

Physical Properties of Soil Moisture,
W80-04606 2G

SOIL PROPERTIES
Soil-Water Retention, Transmission, and Quality of Leachate from Polymer-Treated Soils, Effects of the In Situ Crosslinking,
W80-04609 2G

SOIL WATER MOVEMENT
Chloride Displacement by Water in Homogeneous Columns of Three Soils,
W80-04639 2G

SOILS
A Study of Strontium-90 Movement in a Sandy Soil,
W80-04637 7B

Effect of Simulated Acid Rain on Sulfate Movement in Acid Forest Soils,
W80-04640 2B

SOLID WASTES
The Resource Conservation and Recovery Act of 1976 - The Newest Environmental 'Sleeper'.
W80-04575 6E

SOUTH DAKOTA
Pheasant Use of Wetlands During the Winter and Application of Landsat Imagery for Assessing Winter Habitat,
W80-04544 6G

Aquifers in Walworth County, South Dakota,
W80-04555 4B

SPATIAL DISTRIBUTION
Recurring Aggregation of Zooplankton by a Tidal Current,
W80-04629 2L

SPECIATION
The Estuary Revisited,
W80-04505 2L

SPECIES DIVERSITY
Zooplankton as an Indicator of Pollution of Reservoirs,
W80-04716 5C

Systems of Biological Indicators for Water Quality Assessment,
W80-04727 5C

Acidity and Species Diversity in Freshwater Crustacean Faunas,
W80-04731 5A

SPIRULINA
Photosynthesis and Growth of Spirulina Platensis (Cyanophyta) in an Equatorial Lake (Lake Simbi, Kenya),
W80-04647 5C

SPRINKLER IRRIGATION
Public Health Aspects of Land Disposal of Sugar Refining Wastes by Spray Irrigation,
W80-04608 5B

STANLY COUNTY (NC)
Stanly County Feasibility Report for On-Site Wastewater Systems Management: Phase I,
W80-04771 5G

STATISTICS
Stochastic Synthesis of Hydrologic Data Based on Concepts of Pattern Recognition, III. Performance Evaluation of the Methodology,
W80-04613 2E

STOCHASTIC PROCESSES
A Generalized Probability Density Function for Double-Bounded Random Processes,
W80-04615 2B

STORM RUNOFF
Urban Hydrology in Karst and Water Quality--Inorganic and Organic Systems,
W80-04597 4C

STREAM FISHERIES
Improving Stream Fisheries,
W80-04506 8I

STREAM IMPROVEMENT
Improving Stream Fisheries,
W80-04506 8I

STREAMFLOW
Stochastic Synthesis of Hydrologic Data Based on Concepts of Pattern Recognition, I. General Methodology of the Approach,
W80-04510 2E

Statistical Summary of Streamflow Data for Kansas Streams in the Missouri River Basin,
W80-04550 2E

Stochastic Synthesis of Hydrologic Data Based on Concepts of Pattern Recognition, II. Application of Natural Watersheds,
W80-04612 2E

Stochastic Synthesis of Hydrologic Data Based on Concepts of Pattern Recognition, III. Performance Evaluation of the Methodology,
W80-04613 2E

Adaptive Fourier Analysis of Periodic-Stochastic Hydrologic Sequences,
W80-04616 2E

Critical Drought Analysis of Periodic-Stochastic Processes,
W80-04617 2E

STREAMFLOW FORECASTING
The Green River Basin Routing Model,
W80-04744 6A

STREAMS
Water-Quality Characteristics of Streams in Forested and Rural Areas of North Carolina,
W80-04558 5B

Secondary Production of Epilithic Fauna in a Woodland Stream,
W80-04658 5C

Acute Residual Toxicity of Several Disinfectants in Domestic and Industrial Waste Water,
W80-04717 5A

Effects of Dietary Ascorbic Acid on Chronic Lead Toxicity to Young Rainbow Trout (Salmo Gairdneri),
W80-04720 5A

Effects of Ammonia and Ammonium on Tolerance and Byssogenesis in Perna Viridis,
W80-04721 5C

Acute Toxicity of Heavy Metals to Aquatic Invertebrates at Different Temperatures,
W80-04723 5A

A Comparison of Tolerance to Phenol Exhibited by Aquatic Insects and Arachnida During Ontogenesis,
W80-04724 5C

Some Effects of Salinity and Temperature on the Osmotic and Ionic Regulation of Praunus Flexuosus (Crustacea, Mysidacea) from Isefjord,
W80-04729 5B

A Comparison of Populations of the Isopod Asellus Aquaticus Above and Below Power Stations in Organically Polluted Reaches of the River Trent,
W80-04732 5C

Osmotic Responses of Eggs and Larvae of the Pacific Herring to Salinity and Cadmium,
W80-04733 5B

Cadmium Toxicity to Three Species of Estuarine Invertebrates,
W80-04736 5A

The Combined Effect of Salinity, Temperature and Oil on the Growth Pattern of Embryos of the Killifish, Fundulus Heteroclitus Walbaum,
W80-04737 5A

Liver Cadmium Uptake, Catalase Inhibition and Cadmium Thionein Production in the Killifish (Fundulus Heteroclitus) Induced by Experimental Cadmium Exposure,
W80-04738 5B

Responses of Salt Marsh Vegetation to Oil Spills and Refinery Effluents,
W80-04743 5C

TRACE ELEMENTS
An Environmental Study of the Origin, Distribution, and Bioaccumulation of Selenium in Kentucky and Barkley Lakes,
W80-04672 5B

Chlorotic Death of Lemna Gibba by Cadmium in Different Concentrations of Nutritional Minerals (In Japanese),
W80-04742 5A

TRACERS
Chemical Tracers for Particle Transport in the Chesapeake Bay,
W80-04632 5B

TRACKING TECHNIQUES
Chlorophyll Turnover in Skeletonema Costatum, a Marine Plankton Diatom,
W80-04659 5B

TRANSPIRATION
Simulation of the Effects of Transpiration Losses from the Unsaturated Zone on Seepage from a Soil Slope,
W80-04620 2G

TREATMENT FACILITIES
The Municipal Program of the Clean Water Act: 1978 Administrative Implementation,
W80-04797 6E

TRIDACNA
The Content of Certain Metals in the Soft Tissues of the Bivalve Mollusks Tridacna Squamosa from Islands of the Tropical Zone of the Pacific Ocean in Connection with Environmental Conditions,
W80-04698 5C

TRITIUM
The Interpretation of Tritium in the Chalk Unsaturated Zone,
W80-04621 2F

TUMORS
Three Types of Skin Papillomas of Flatfishes and Their Causes,
W80-04713 5A

TURBIDITY
Chemical Tracers for Particle Transport in the Chesapeake Bay,
W80-04632 5B

TURBULENCE
Turbulence Prediction in Open Channel Flow,
W80-04645 2E

TURKEY
Critical Drought Analysis of Periodic-Stochastic Processes,
W80-04617 2E

U.S. CORPS OF ENGINEERS
Water Resources Development by the U.S. Army Corps of Engineers in North Carolina.
W80-04770 6B

UNITED STATES
Hydrologic and Human Aspects of the 1976-77 Drought,
W80-04552 2E

The Roots of U.S. Fisheries Policy,
W80-04587 6E

UNSATURATED FLOW
Simulation of the Effects of Transpiration Losses from the Unsaturated Zone on Seepage from a Soil Slope,
W80-04620 2G

The Interpretation of Tritium in the Chalk Unsaturated Zone,
W80-04621 2F

URBAN IMPACT
Interceptor Sewers and Urban Sprawl,
W80-04751 5D

URBAN LAND USE
Interceptor Sewers and Urban Sprawl,
W80-04751 5D

URBAN POOR TARGET POPULATION
Water Supply Service for the Urban Poor: Issues,
W80-04765 6B

URBAN POVERTY PROGRAM
Water Supply Service for the Urban Poor: Issues,
W80-04765 6B

URBAN RUNOFF
Quantification of Non-Point Water Pollutants from Logging, Cattle Grazing, Mining, and Subdivision Activities,
W80-04669 5A

URBANIZATION
Urban Hydrology in Karst and Water Quality--Inorganic and Organic Systems,
W80-04597 4C

Interceptor Sewers and Urban Sprawl,
W80-04751 5D

UREAS
The Uptake of Urea by the Diatom, Phaeodactylum,
W80-04653 5C

UTAH
Effects of Changes in Drainage-Basin Boundaries on Sedimentation in Eocene Lakes Gosiute and Uinta of Wyoming, Utah, and Colorado,
W80-04541 2J

Hydrology and Surface Morphology of the Bonneville Salt Flats and Pilot Valley Playa, Utah,
W80-04563 2F

VALLISNERIA AMERICANA
Comparative Carbohydrate Storage and Utilization Patterns in the Submersed Macrophytes, Myriophyllum Spicatum and Vallisneria Americana,
W80-04665 5B

VARIABILITY
Short-Term Variations in Phytoplankton Biomass in a Tidal Estuary in Northern Brittany,
W80-04633 2L

VEGETABLE CROPS
Water, Waste and Quality Management During Preparation and Processing of Vegetables,
W80-04671 3F

VEGETATION REGROWTH
The North Maroondah Experiment Pretreatment Phase Comparison of Catchment Water Balances,
W80-04512 4A

VIRGINIA
Improving Stream Fisheries,
W80-04506 8I

VISTULA RIVER (POLAND)
Lethal Temperatures for Fish,
W80-04682 5A

Behaviour of Fish in a Thermally Differentiated Environment,
W80-04683 5C

Fish Metabolism,
W80-04684 5A

Sexual Maturity of Fish in Heated Waters,
W80-04685 5C

Spawning of Fish and Their Embryonic and Larval Development,
W80-04686 5C

Feeding of Fish and Their Feeding Grounds,
W80-04687 5A

Growth of Fish in Heated Environments,
W80-04688 5C

Changes of Fish Communities in Heated Environments,
W80-04690 5C

The Impact on Ichthyofauna and Possible Control of the Effects of Thermal Discharge,
W80-04691 5A

VOLATILE COMPOUNDS
Urban Hydrology in Karst and Water Quality--Inorganic and Organic Systems,
W80-04597 4C

WAADAH ISLAND (WA)
Growth and Longevity in the Crustose Red Alga Petrocelis Middendorffii,
W80-04651 5C

WALES
Welsh Floodplain Studies, II. Application of a Qualitative Inundation Model,
W80-04511 2E

WASTE DISPOSAL
Effects of Slash Burial on Stream Water Quality,
W80-04517 5B

The Resource Conservation and Recovery Act of 1976 - The Newest Environmental 'Sleeper'.
W80-04575 6E

Ground Water Vs. Hazardous Wastes,
W80-04675 5G

WASTE DISPOSAL WELLS
Borehole Geophysics as Applied to the Management of Radioactive Waste -- Site Selection and Monitoring,
W80-04561 5E

WASTE TREATMENT
Acute Residual Toxicity of Several Disinfectants in Domestic and Industrial Waste Water,
W80-04717 5A

Glyceria Maxima (Hartm.) Holmb. in Ponds Supplied with Post-Sewage Water,
W80-04730 5D

WASTE WATER DISPOSAL
Nutritional Composition of Water Hyacinths Grown on Domestic Sewage,
W80-04660 4A

WASTE WATER (POLLUTION)
Analysis of Rivers and Streams of Southern Missouri for EPA Priority Pollutants Using Liquid Chromatography,
W80-04598 5A

Water, Waste and Quality Management During Preparation and Processing of Vegetables,
W80-04671 3F

The Federal Water Pollution Control Act - Industrial Challenges to Effluent Limitations,
W80-04792 6E

WASTE WATER TREATMENT
Biodegradation of Thiocyanate by Microorganisms Isolated from Gas Liquor,
W80-04605 5D

Stanly County Feasibility Report for On-Site Wastewater Systems Management: Phase I,
W80-04771 5G

Federal Environmental Litigation in 1976: The Federal Water Pollution Control Act,
W80-04783 6E

WASTEWATER TREATMENT
Design of Wastewater Treatment Facilities, Major Systems.
W80-04773 8A

WASTEWATER TREATMENT FACILITIES
Design of Wastewater Treatment Facilities, Major Systems.
W80-04773 8A

WATER
Permittivity of Ice and Water at Millimeter Wavelengths,
W80-04635 2C

Coordinating Land and Water Use Planning for Sound Resource Management,
W80-04761 6E

WATER ALLOCATION (POLICY)
Special Considerations Involving Indian Rights,
W80-04574 6E

Blue Lake: A Struggle for Indian Rights,
W80-04578 6E

Impact of Energy Development on the Law of the Colorado River,
W80-04775 6E

Report to Governor John A. Love on Certain Colorado Water Law Problems,
W80-04798 6E

WATER ANALYSIS
Analysis of Rivers and Streams of Southern Missouri for EPA Priority Pollutants Using Liquid Chromatography,
W80-04598 5A

WATER BALANCE
The North Maroondah Experiment Pretreatment Phase Comparison of Catchment Water Balances,
W80-04512 4A

A One-Dimensional Representation of Residual Currents in the Severn Estuary and Associated Observations,
W80-04630 2L

WATER CHEMISTRY
The Chemistry of Lake Myvatn and River Laxa,
W80-04657 5C

The Effects of Hardness, Alkalinity and pH of Test Water on the Toxicity of Copper to Rainbow Trout (Salmo Gairdneri),
W80-04699 5B

Groundwater Characteristics and Corrosion Problems Associated with the Use of Geothermal Water in Klamath Falls, Oregon,
W80-04763 8G

WATER CIRCULATION
A One-Dimensional Representation of Residual Currents in the Severn Estuary and Associated Observations,
W80-04630 2L

WATER COMMISSION
Implications for the Future: Design of Viable International Institutions,
W80-04776 6E

WATER CONSERVATION
State Agency Efforts in Water Conservation.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 13, NUMBER 15
AUGUST 1, 1980

W80-04801 -- W80-05100
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the
Office of Water Research and Technology
U.S. Department of the Interior

VOLUME 13, NUMBER 15
AUGUST 1, 1980

W80-04801 -- W80-05100

The Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most our our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographic citation and a set of identifiers or descriptors which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Office of Water Research and Technology.

To provide SWRA with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

The input from these Centers, and from the 54 Water Resources Research Institutes administered under the Water Research and Development Act of 1978, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies becomes the information base from which this journal is derived.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology
U.S. Department of the Interior
Washington, D.C. 20240

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

LINEARIZED SUBHYDROGRAPH ROUTING OF DIRECT RUNOFF,
Nevada Univ. System, Reno. Desert Research Inst.
V. L. Gupta, P. C. Orphan, and J. W. Bird.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182058, Price codes: A03 in paper copy, A01 in microfiche. Publication No 41060, September 1979. 27 p, 4 Fig, 3 Tab, 16 Ref. OWRT-A-090-NEV(1), 14-34-001-9030.

Descriptors: *Peak discharge, *Forecasting, *Hydrograph analysis, Methodology, Reviews, Evaluating, Computer programs, Ungaged drainage basins, Rainfall-runoff relationships, Streamflow, Flow rates, Runoff, *Linearized Subhydrograph Routing.

A pilot study was conducted involving the development and testing of a computerized methodology entitled 'Linearized Subhydrograph Routing' for the estimation and simulation of the peak rates of runoff from small drainage basins. The method can be considered a refinement over the more popularly used 'rational method.' Selected rainfall-runoff events of twelve drainage basins were utilized in testing the methodology. Several limitations were recognized. The Linearized Subhydrograph Method uses data readily available to engineers, was written as a computer program for ease of calculation, and was tested with field data. (Smith-Nev)

USE OF THE CLIMATIC WATER BUDGET TO ESTIMATE STREAMFLOW,
Delaware Univ., Newark. Dept. of Geography.
J. R. Mather.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180896, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Center, University of Delaware. Technical Research Report, July 1979. 52 p, 3 Fig, 12 Tab, 14 Ref, 5 Append. OWRT A-040-DEL(4), 14-34-0001-9008.

Descriptors: *Streamflow forecasting, *Climatology, *Water balance, *Hydrologic budget, Precipitation(Atmospheric), Runoff, Overland flow, Soil water movement.

The climatic water budget provides values of water surplus, the precipitation in excess of both the evapotranspiration needs and the needs for recharge of storage in the soil root zone. It is this surplus water which will ultimately find its way to the surface to the surface streams. This report describes the problems involved in obtaining good agreement between monthly computed and measured runoff, the problems of snow accumulation and snowmelt runoff and illustrates in a step-by-step example how to lag the monthly surplus values to simulate the slow movement of water through the soil to the water table and then to the surface stream. The report also includes all necessary tables and instructions to permit computation of direct overland runoff by means of the Soil Conservation Service method and shows how such an approach can be incorporated into the climatic water budget bookkeeping procedure.

MULTIVARIATE SHORT-TERM RAINFALL PREDICTION,
National Weather Service, Silver Spring, MD. Hydrologic Research Lab.
E. R. Johnson, and R. L. Bras.
Water Resources Research, Vol 16, No 1, p 173-185, February 1980. 13 Fig, 12 Ref. NSF ENG76-118-17.

Descriptors: *Rainfall, *Forecasting, *Model studies, Mathematical models, Storms, Storm runoff, Runoff forecasting, Weather forecasting, Rain gages, Precipitation(Atmospheric), Sewers, Urban runoff, Meteorology, Short-term forecasting.

Accurate hydrologic forecasting for basins with a short response time depends on the ability to predict quantitative rainfall rates. This study developed a stochastic model for short-term (of the order of 1 hour or less) rainfall prediction. The model simultaneously predicts rainfall rates at multiple locations and for multiple values of prediction lead. All model parameters are estimated solely from telemetered rain gage data for the event being predicted. The model includes velocity and direction of storm movement as explicit parameters. The storm arrival time at each predicted point is likewise an explicit parameter, which is estimated for each location. The mean rainfall rate is not modeled as being either homogeneous spatially or stationary (constant with time). Likewise, the variance of rainfall is nonhomogeneous and nonstationary. (Sims-ISWS)

COLUMBIA GLACIER STAKE LOCATION, MASS BALANCE, GLACIER SURFACE ALTITUDE, AND ICE RADAR DATA, 1978 MEASUREMENT YEAR,
Geological Survey, Fairbanks, AK. Water Resources Div.
L. R. Mayo, D. C. Trabant, R. March, and W. Haeberli.
Available from: OFSS Box 25425, Fed. Ctr. Denver, CO 80225, Paper copy $10.00, Microfiche $3.50. Geological Survey, open-file report 79-1168, 1979. 72 p, 4 Fig, 11 Tab, 2 Ref.

Descriptors: *Glaciers, *Measurement, *Forecasting, *Icebergs, Basic data collections, Sites movement, Altitude, Regimen, Ice, Snowpacks, Ablation, Alaska, *Columbia Glacier(Alaska), Prince William Sound, Ice kinematics.

A 1 year data-collection program on Columbia Glacier, Alaska has produced a data set consisting of near-surface ice kinematics, mass balance, and altitude change at 57 points and 34 ice radar soundings. These data presented in two tables, are part of the basic data required for glacier dynamic analysis, computer models, and predictions of the number and size of icebergs which Columbia Glacier will calve into shipping lanes of eastern Prince William Sound. A metric, sea-level coordinate system was developed for use in surveying throughout the basin. Its use is explained and monument coordinates listed. A series of seven integrated programs for calculators were used in both the field and office to reduce the surveying data. These programs are thoroughly documented and explained in the report. EXTENSION AND APPLICATION OF FEATURE PREDICTION MODEL FOR SYNTHESIS OF HYDROLOGIC RECORDS,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
U. S. Panu, and T. E. Unny.
Water Resources Research, Vol 16, No 1, p 77-96, February 1980. 11 Fig, 9 Tab, 20 Ref, 2 Append.

Descriptors: *Streamflow, *Synthetic hydrology, *Model studies, *Canada, Rivers, Flow, Mathematical models, Drainage, Watersheds(Basins), Stochastic processes, Analytical techniques, Mathematics, Hydrology.

The method described in this paper for the synthesis of streamflows differed from the traditional approaches in synthetic hydrology in the sense that it utilizes the information contained in or among the groups of data in a streamflow record. The existence of such groups in geophysical records, including hydrologic records, was well emphasized by Hurst. Further, in the proposed method, based on concepts of pattern recognition, neither a basic structure nor any preconceived model was imposed on the data; rather the data are allowed to speak for themselves in a most 'democratic' way. The preliminary details of the method were provided in an earlier paper by Panu and others. The intent of this paper was to describe a procedure whereby it is possible to specify explicitly multivariate probability distribution for the intrapattern structure and first-order Markovian dependence for the interpattern structure in the feature prediction model. The various steps involved in the construction and operation of the model for streamflow synthesis were presented. The application of the model for synthesizing monthly streamflow records of three Canadian rivers exhibiting biannual cycles was explained. Statistical and hydrological tests showed that these synthetic realizations possess relevant properties that are comparable with the corresponding properties contained in the historical record. This article should be read in conjunction with the previous publication by Panu and others. (See also W78-09201) Sims-ISWS)

Erosion, Sediments, Sediment transport, Model studies, Mathematical models, On-site investigations, Hydrology, *Rapids, River rapids, Dam effects.

The force of flowing water and the resistance of the largest boulder provide a means of evaluation of the stability of rapids in canyon rivers. Field measurements and calculations showed that the closure of Flaming Gorge Dam, Utah, has had a significant effect on the stability of rapids in the canyons of the Green River in Dinosaur National Monument 68 km (42 mi) downstream from the dam. The reduction in peak flows by the dam has limited the competence of the river to move boulders deposited in the main channel by tributary processes, landslides, and prehistoric floods. Before the dam was closed, 62% of the rapids were stable, as indicated by the immobility of the largest boulder in each rapid. After the dam was closed, 93% of the rapids were stable as geomorphic/hydraulic features, though small boulders continue to move. A continuing buildup of boulders in the rapids will result from tributary contributions which are not affected by the dam. (Sims-ISWS)

NEW ROUTING MODEL FOR CONTINUOUS RUNOFF SIMULATION,
New South Wales Univ., Kensington (Australia).
M. S. K. Chowdhury, and F. C. Bell.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY4, Proceedings Paper 15357, p 489-500, April 1980. 6 Fig, 12 Ref, 2 Append.

Descriptors: *Channel flow, *Flood routing, *Runoff forecasting, Flood flow, Flood forecasting, Overland flow, Storage, Waves(Water), Runoff, Mathematical models, Flow, Model studies, *Runoff simulation, Continuous runoff models, Kinematics.

A new runoff routing model has been developed that combines realistic allowances for the spatial distribution of storage with the theoretically satisfying features of the kinematic wave approximation. Appropriate boundary conditions enable replacement of the partial differential equations describing the flow by tractable total differential equations. Also, similar forms of equations have been adopted to describe both overland and channel flow. All these features result in a relatively simple model with a small number of physically relevant parameters that are not difficult to evaluate. The use of the current discharge as a state variable enables the model to be automatically tuned to the current conditions and is particularly suitable for short-term flood forecasting. (Lee-ISWS)

FINITE ELEMENT METHOD FOR DIRECT RUNOFF FLOW,
Chuo Univ., Tokyo (Japan). Dept. of Civil Engineering.
M. Kawahara, and T. Yokoyama.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY4, Proceedings Paper 15341, p 519-534, April 1980. 14 Fig, 15 Ref, 2 Append.

Descriptors: *Storm runoff, *Runoff forecasting, *Finite element analysis, Theoretical analysis, Floods, Flow resistance, Hydrology, Numerical analysis, Rainfall, Runoff, Hydrodynamics, Flow, Viscosity, Friction.

The Galerkin finite element method based on the linear interpolation function and explicit numerical integration scheme in time was used. Three numerical examples were illustrated. The first example was the validation of the present method. The numerical results have compared with the experimental data and the analytical solution. Both results are well in agreement. The second example discussed the selection of the refinement of the finite element mesh and the time increment. Useful suggestions were presented for the selection of the time increment. The third example showed the computation of the direct-runoff flow over Ina basin of Tenryu River. The bed resistance was seen to have significant effects both on the flow pattern and on the computational stability. The finite element method presented in this paper was shown to be adaptable for the prediction analysis of flow change due to structures. (Lee-ISWS)

Journal of Hydrology, Vol 46, No 3/4, p 281-287, April 1980. 5 Fig, 3 Ref.

Descriptors: *Runoff, *Model studies, *Synthetic hydrology, Mathematical models, Markov processes, Mathematics, Mathematical studies, Time series analysis, Analytical techniques, Hydrology.

A Markovian process (X sub t; t = 0,1,2...) following a negative exponential distribution and with an exponentially decaying autocorrelation function was proposed and described in this paper. This model can be useful to simulate autocorrelated and skewed hydrologic variables. To show this, a successful application to model direct runoff peaks was presented. Some interesting theoretical properties of this process concerning upcrossing intervals and the distributions of extremes were also analyzed. (Sims-ISWS)

AN ANALYSIS OF HYDRODISPERSIVE TRANSFER IN AQUIFERS,
Bureau de Recherches Geologiques et Minieres, Orleans (France). Service Geologique National.
J-P. Sauty.
Water Resources Research, Vol 16, No 1, p 145-158, February 1980. 19 Fig, 1 Tab, 17 Ref.

Descriptors: *Dispersion, *Aquifers, *Mathematical models, Mass transfer, Porous media, Convection, Uniform flow, Curves, Equations, Tracers, Solutes, Groundwater movement, Radial flow, Transport.

This work was concerned with the nonreactive transport of solute materials in groundwater, or hydrodispersive transfer. Several types of flow fields were considered: linear (or uniform) flow with one- and two-dimensional dispersion and radial flow under diverging and converging conditions. The analysis included the two main possibilities for introduction of solutes into an aquifer: continuous and instantaneous (or slug) injection. Different solutions from the literature plus some original solutions for dispersion in a linear flow field have been unified by transposing the solutions into dimensionless variables of concentration (C sub R), time (t sub R), and the Peclet number (P). This permits an analysis of the errors committed in some commonly used approximations for dispersion as a function of P. In the case of radial flow, a numerical method using finite differences has been developed that can be applied to either diverging or converging flow problems. Results in dimensionless form when compared to the only analytical approximations that could be found (for continuous injection in a diverging flow field) indicate that the approximate solutions are in error when P is less than or equal to 10. The radial flow results are also compared to those for linear flow fields to demonstrate that in most cases either approach can be used as long as P is greater than 3. A series of dimensionless type curves has been developed showing C sub R vs. t sub R for practical ranges of P. A simple method of interpreting tracer tests was proposed using these type curves. One is able to directly determine dispersivity and kinematic porosity using curve matching techniques. Results from some recent field tests in France were analyzed using this approach. There is definite confirmation from these investigations that the apparent (macroscopic) dispersivity can vary depending on the distances used in the field. (Visocky-ISWS)

THE ROTATION OF A VERTICAL INTERFACE IN A POROUS MEDIUM,
Technische Hogeschool, Delft (Netherlands). Dept. of Civil Engineering.
A. Verruijt.
Water Resources Research, Vol 16, No 1, p 239-240, February 1980. 2 Fig, 6 Ref.

Descriptors: *Interfaces, *Density, *Porous media, *Model studies, Injection wells, Mathematical models, Groundwater movement, Soil water, Porosity, Hydraulic conductivity, Aquifers, Flow, Viscosity, Permeability, Groundwater, Density interfaces, Interface rotation.

A solution was given to the problem of the simultaneous flow of two different fluids in a vertical plane, separated from each other by a vertical interface. It was shown that the viscosities of the two fluids influence the motion of the interface only through their average value. A simple formula for the rotation of the interface was derived in terms of the relative density difference. (Sims-ISWS)

This map report presents the thickness of the surficial deposits overlying the upper confining bed of the Floridan aquifer in the Southwest Florida Water Management District. The surficial deposits range in thickness from less than 25 feet in the western part of the district to greater than 250 feet in the eastern part. The surficial deposits include sand, clayey sand, shell, and shelly marl that occur in the Holocene sand, Pleistocene marine terrace sand, and unconsolidated parts of the Fort Thompson Formation, Caloosahatchee Marl, Alachua Formation, and Bone Valley Formation. Lithologic logs and information from quarries were used in conjunction with an unpublished map prepared during an earlier investigation to compile this map at 1:250,000 scale. (Kosco-USGS)

MEASUREMENT, PREDICTION, AND HAZARD EVALUATION OF EARTH FISSURES AND SUBSIDENCE, SOUTH-CENTRAL ARIZONA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
J. K. Boling, M. Carpenter, N. Johnson, and S. Davis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-183908, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Research Center, University of Arizona Project Completion Report, 1980, 96 p. OWRT A-092-ARIZ(1), 14-34-0001-9003.

Descriptors: *Erosion, *Subsidence, *Fissures(Geologic), *Pumping, *Withdrawal, Groundwater, Ephemeral streams, Sediment transport, Deposition(Sediments), Fissure closures, Arizona, *Earth fissures.

Earth fissuring and subsidence research in south-central Arizona consisted of two areas of study: (1) measurement of horizontal movements of earth fissures and (2) mapping of erosional features and hazard evaluation of earth fissures. Our records will form the data base for predictive models of subsidence and earth fissuring. Detailed bimonthly horizontal strain measurements of fissures were made over a three-year period at locations near Signal Peak, Picacho Mountains, and in Avra Valley. Fissures opened and closed repeatedly. They exhibited relatively smooth movement with occasional sudden jumps. During a major event in a locality, all fissures were affected. Some opened, and some closed. Fissures closed during long dry periods and opened after high rainfall. After periods of high pumping rates followed by high rainfall, fissures opened. Among different fissure movements the greatest total was 20.27 mm, the greatest single movement was 30 mm, and, exclusive of that, the greatest net movement was 10.9 mm. Erosional features of earth fissures were mapped and studied over a period of two years at several sites. Documentation of erosional rates and ephemeral-stream processes required the development of original instrumentation. Determination of the approximate volume of sediment and water absorbed by fissure cavities has indicated that fissure depths may commonly exceed 100 m. The relative magnitude of fissure versus subsidence-induced erosion is discussed as to the potential for ground-water contamination by way of fissures.

2G. Water In Soils

INFILTRATION UNDER RAPIDLY VARYING SURFACE WATER DEPTHS,
Stanford Univ., CA. Dept. of Geology.
J. W. Reeder, D. L. Freyberg, J. B. Franzini, and I. Remson.
Water Resources Research, Vol 16, No 1, p 97-104, February 1980. 8 Fig, 18 Ref. NSF ENG76-01271.

Descriptors: *Infiltration, *Soil water, *Model studies, *Laboratory tests, Mathematical models, Soil moisture, Wetting, Soil water movement, Depth, Hydrographs, Infiltration rates, Surface waters, Hydraulic conductivity, Water depths.

Effects of fluctuations in surface water depth on infiltration rates into initially unsaturated soils were investigated by numerically solving the Richards equation. The numerical model was verified through comparison with published solutions of Philip and with the results of laboratory experiments on a well-graded crushed dune sand. It was found that infiltration rates may increase with time in response to rapid rates of increase in water depth. Conditions under which this will occur were identified. (Sims-ISWS)

PERCOLATION THEORY AND MODELS OF UNSATURATED POROUS MEDIA,
National Inst. for Physical Planning and Construction Research, Dublin (Ireland).
J. M. Golden.
Water Resources Research, Vol 16, No 1, p 201-209, February 1980. 1 Fig, 37 Ref, 1 Append.

Descriptors: *Percolation, *Porous media, *Theoretical analysis, *Model studies, Mathematical models, Soil water, Soil water movement, Infiltration, Pores, Porosity, Hysteresis, Wetting, Drying, Statistics, Probability.

Concepts from percolation theory were applied to a model of unsaturated flow through porous media. This approach in principle allows one to build into the model aspects of the topological structure of pore space. At a very general level the input of results from percolation theory gives a relationship between minimum and maximum saturation values for a medium which should be experimentally checkable, though probably not without sophisticated techniques. Also, it gives some qualitative insight into known properties of unsaturated flow. Furthermore, there emerges a way of looking at the phenomenon of hysteresis that is quite different from the standard approach. This aspect was explored in some detail, and two possible new models were presented. A subsidiary result obtained from the detailed model used is that in a simple pore model the inclusion of a pore length parameter, statistically correlated with pore radius, is equivalent, at least in a restricted sense, to incorporating into the model the concept of tortuosity. (Sims-ISWS)

2H. Lakes

WINTER LIMNOLOGICAL CONDITIONS IN A PRAIRIE POTHOLE LAKE AND THE APPLICATION OF MOLECULAR OXYGEN,
South Dakota Cooperative Fishery Research Unit, Brookings.
R. A. Fike.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180805, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, April 1979. Applegate, R. L., principal investigator. 70 p, 14 Fig, 5 Tab, 32 Ref. OWRT A-059-SDAK(1), 14-34-0001-7088.

Descriptors: *Oxygenation, *Limnology, *Winterkilling, *Iced lakes, South Dakota, Eutrophication, Lake stages, Phytoplankton, Biochemical oxygen demand, Metabolism, Hydrogen sulfide, Ice cover, Snow cover, Light penetration, Dissolved oxygen, Chlorophyll.

The use of molecular oxygen aeration under the ice cover as a method to prevent winterkill in Round Lake, South Dakota, was evaluated during

the winter of 1977-1978. Physical, chemical and biological limnological conditions are documented for the period. Round Lake and other shallow eutrophic pothole lakes in South Dakota often suffer winterkill due to their high level of nutrients that promote rapid phytoplankton growth in summer. These phytoplankton die and decay rapidly consuming dissolved oxygen by catabolic processes in winter when the ice and snow cover prevents them from getting light. During the winter studied, the ice and snow cover was formed by December 20 and after that date phytoplankton numbers and chlorophyll concentration decreased. After January 19 dissolved oxygen declined to anoxic conditions and hydrogen sulfide gas levels peaked on February 12. Measurement of the community respiration by the diel oxygen method showed that it declined to a low on January 11 and 12 while water biochemical oxygen demand increased. A molecular oxygenation apparatus was used with three different strategies to release 711,400 liters of oxygen under the ice cover. While this oxygenation did have an effect on reversing the chemical and biological interactions leading to the lake's anoxic conditions, it was not successful in preventing winterkill. Calculations of total lake oxygen demand for the winter studied (which was severe) showed a demand of 1.05 x 10 to the 8th power liters of oxygen which would require an expenditure of $70,000 to $350,000 to prevent winterkill. VERTICAL MIXING INDUCED BY WIND AND A ROTATING SCREEN IN A STRATIFIED FLUID IN A CHANNEL,
Technion--Israel Inst. of Tech., Haifa.
E. Kit, E. Berent, and M. Vajda.
Journal of Hydraulic Research, Vol 18, No 1, p 35-58, 1980. 16 Fig, 27 Ref.

Descriptors: *Mixing, *Laboratory tests, *Entrainment, *Bodies of water, *Hydraulic models, Open channels, Flow characteristics, Stratification, Winds, Boundary processes, Circulation, Stratified flow, Saline water-freshwater interfaces, Interfaces, Water circulation, Shear stress, Analytical techniques, Methodology, Analysis, Theoretical analysis, Distribution patterns, Flow profiles, Mathematical models, Velocity, Profiles, Vertical mixing, Moving screens, Entrainment rate, Two layer fluid.

An experimental investigation of vertical mixing induced by wind or by a screen which moved horizontally over the water surface was carried out in a wind-wave channel. It was found that in the wind-wave channel the entrainment rate due to the shear stress which was exerted on the water surface by the moving screen was two orders of magnitude smaller than the one obtained in similar experiments which were carried out in an annular tank. The entrainment rate in the wind-induced mixing experiments was one order of magnitude larger than that found in the experiments with the horizontally moving screen, both carried out in the same channel. The explanation of these differences is based on the analysis of the flow patterns in the mixed layer in both systems. Results of the current experiments with the wind-induced entrainment seem to be applicable to water bodies of limited size, such as solar ponds. Since the influence of internal seiches was not the subject of the current research, the main results of this work could be used only for the estimation of the lower limit of the entrainment rate in the real bodies. WIND-DRIVEN CIRCULATION IN SMALL SHALLOW LAKES: LABORATORY AND COMPUTATIONAL EXPERIMENTS,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
A. Giorgini, and D. D. Gray.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180789, Price codes: A06 in paper copy, A01 in microfiche. Technical Report No 128, April 1980. 103 p, 44 Fig, 3 Tab, 28 Ref, 1 Append. OWRT A-048-IND(2).

Descriptors: *Lakes, *Winds, *Ponds, *Lake sediments, *Circulation, *Fourier analysis, Air circulation, Bathymetry, Sediments, Bottom sediments, Sediment-water interface, Bodies of water, Wind pressure, Effects, Water circulation, Model studies, Laboratory tests.

The research deals mainly with laboratory experiments and computational experiments. The laboratory experiments present the circulation patterns caused by different winds in two lake models built in the wind tunnel: a paraboloidal lake and a reduction of the Blackbird Pond, near West Lafayette. The experiments were executed in order to have controlled standards of comparison with the numerical experiments. The computational part of the research has been performed by using the Fast Fourier Transform algorithm technique. This was considered necessary because of the high sensitivity of sediments patterns to small velocity errors. A detailed theoretical background for the simulation is presented and several numerical experiments are performed: on the paraboloidal lake, on the Blackbird Pond bathymetry, and on a special bathymetry for which an exact solution has been found. The comparison of the laboratory experiments with the numerical experiments shows agreement, but some local deviation. This is attributed to the spatial variation of eddy viscosity in the laboratory experiment, not matched by the constant value in the numerical experiments.

THE ACID-BASE BALANCE IN LAKE WATER,
Swedish Water and Air Pollution Research Lab., Goteborg.
C. Brosset.
Technical Report B 540, February 1980, 21 p, 3 Fig, 5 Tab, 4 Ref.

Descriptors: *Lakes, *Acid-base equilibrium, *Methodology, *Volumetric analysis, Hydrogen ion concentration, Acidity, Alkalinity, Fulvic acid, Analytical techniques, Carbonic acid, Carbon dioxide, Weak acids, Acidity constants, Equations.

Previous studies of the determination of the concentration and acidity constants of acids in natural waters are extended to emphasize the determination of the total acid-base balance in nine lake water samples taken in January-February 1978. Using a simple titration method, the acid-base system may be divided into three parts; (1) strong acid or base, (2) weak acids, primarily fulvic acid, and (3) carbonic acid. At least two different weak acids can be determined if their acidity constants are within 0.001-0.000001 and if no other weak acids are present. All samples contained essentially the same acid with an acidity constant near 0.00002-0.00003. Two samples contained an additional acid with the constant 0.0003-0.0004. This weak acid determination makes the determination of strong base/acid concentrations in the sample possible, and subsequently, carbonic acid concentration can be calculated by using the pH value. It is concluded that excess strong base observed is generally in good agreement with previously measured alkalinity. In the cases where zero alkalinity values were reported, excess strong acid could be measured. When excess base is present, high values of H2C02 indicates the possibility of supersaturation with C02. Interestingly, this increase in supersaturation increased with concentration of the strong base and in most cases of the fulvic acid at about the same pH. No simple explanation is offered for these observations, nor is it clear why excess C02 is not easily removed, even from acidified lake water samples when they contain fulvic acid. FRESHWATER PHYTOPLANKTON FROM THE NARSSAQ AREA, SOUTH GREENLAND,
Copenhagen Univ. (Denmark). Freshwater Biological Lab.
G. Nygaard.
Botanisk Tidsskrift, Vol 73, No 3-4, p 191-238, 1978. 378 Fig, 19 Tab, 141 Ref.

Descriptors: *Greenland, *Phytoplankton, *Lakes, *Surveys, Narssaq(Greenland), Algae, Chlorophyta, Chrysophyta, Diatoms, Density, Diversity, Oligotrophy, Population, Productivity, Sampling, Dinobryon, Freshwater.

Phytoplankton of 17 lakes situated in the Narssaq Area of South Greenland was studied as part of a detailed geo-chemical and ecological investigation. Chrysophyceae, especially a large variety of Dinobryon species make up the greater part of the plankton in most of the lakes. Chlorophyceae, represented by the chlorococcalean genera Coenococcus and Crucigeniella and by several species of the desmid Staurodemus, were prevalent or subdominant in some of the lakes. Blue-green algae is rarely found in these lakes. Diatoms play a more important role in the plankton communities than dinoflagellates. The ultra-oligothrophic character of the lakes is revealed by the low densities varying from 24 to 70,000 algal individuals and colonies/litre of surface water. Lakes in the southern part of the Ilimaussaq intrusion were extremely low in plankton, while lakes in the adjacent area displayed far greater densities. These differences may be due to the different chemical composition and physical properties of the rocks in the respective regions. In particular, the more massive, fine-grained rocks in Region 3 are covered with a dense vegetation which provides vital organic compounds to lake waters. Though these undisturbed arctic lakes are low in phytoplankton density, an exceptional diversity of species exists. Sixteen new taxons and 82 questionable taxons were reviewed. (Luedtke-Wisconsin)

WATER STORAGE ON FOREST FOLIAGE: A GENERAL MODEL,
Oregon Univ., Eugene. Dept. of Biology.
W. J. Massman.
Water Resources Research, Vol 16, No 1, p 210-216, February 1980. 4 Fig, 7 Ref, 1 Append. NSF DEB78-03583.

Descriptors: *Water storage, *Forests, *Mathematical models, Interception, Forest watersheds, Foliar, Fog, Model studies, Rain, Evaporation, *Forest foliage, *General model, Dimensionless parameters, Drip rate, Water storage capacity, Model predictions, Storage process, Dynamical model.

A model for the prediction of water accumulation on forest foliage was presented. It is general enough to include linear, exponential, or logarith-

mic forms for the buildup of accumulated water and to go from any one of these three limiting forms to any other in a continuous manner by varying a single dimensionless parameter. This equation unifies into a single form many other models used to predict water accumulation on forest foliage. An exploration of the underlying assumptions relating drip rate to interception intensity showed how these other models differed from one another. Evaporation was included in the model by using another dimensionless parameter which may be useful in regions where only an approximate estimate of the evaporation rate was available. To include evaporation correctly into the model, it was necessary to define the water storage capacity first in order to interpret the model predictions. (Roberts-ISWS)

FORESTS AND FLOODING WITH SPECIAL REFERENCE TO THE WHITE RIVER AND OUACHITA RIVER BASINS, ARKANSAS,
Geological Survey, Lakewood, CO. Water Resources Div.
M. S. Bedinger.
Geological Survey Water-Resources Investigations 79-68 (open-file report), 1979. 27 p, 4 Fig, 3 Tab, 78 Ref.

Descriptors: *Forests, *Floods, *Arkansas, *Deciduous trees, *Geomorphology, Hydrologic cycle, Plant physiology, Ecology, Submergence, Soil moisture, Drainage effects, Soil-water-plant relationships, Flood frequency, Flood plains, Model studies, Sampling, Sites, Annual flood, Benthic flora, Regulated flow, Post-impoundment, White River basin(Ark), Ouachita River basin(Ark).

The observed response of trees to hydrologic stress and distribution of trees in relation to habitat indicate that flooding, ground-water level, soil moisture, soil factors, and drainage characteristics exert a strong influence on bottomland forest species distribution. The dominant hydrologic factor influencing the distribution of bottomland tree species is flooding. Individual tree species are distributed as a function of frequency and duration of flooding. In the lower White and Ouachita River basins, the flood plains consist of a series of terraces, progressively higher terraces having less frequent flooding and less duration of flooding, and a significantly different composition of forest tree species. The sites studied can be divided into four basic groups and several subgroups on the basis of flood characteristics. On Group I (water hickory-overcup oak) sites, flooded near annually 32 to 40 percent of the time, the dominant species are water hickory and overcup oak. On Group II (nuttall oak) sites, flooded near annually 10 to 21 percent of the time, a more varied flora exists including nuttall oak, willow oak, sweetgum, southern hackberry, and American elm. The third group (Group III or shagbark hickory-southern red oak) of sites is flooded at intervals from 2 to 12 years. This group includes southern red oak, shagbark hickory, and black gum. The presence of blackjack oak in addition to Group III species marks Group IV (not flooded in historic time). (Kosco-USGS)

SIMULATION OF WETLANDS FOREST VEGETATION DYNAMICS,
Geological Survey, Reston, VA. Water Resources Div.
R. L. Phipps.
Ecological Modelling, Vol 7, p 257-288, 1979. 11 Fig, 12 Tab, 24 Ref.

Descriptors: *Computer models, *Wetlands, *Forests, *Vegetation, *Flood frequency, Computer programs, Model studies, Hydrologic data, Trees, Soil-water-plant relationships, Flood control, Lumbering, Dendrochronology, Ecological distribution, Environmental effects, Wildlife management, Arkansas, *White River National Wildlife Refuge(Ark), SWAMP.

A computer program, SWAMP, was designed to simulate the effects of flood frequency and depth to water table on southern wetlands forest vegetation dynamics. By incorporating these hydrologic characteristics into the model, forest vegetation and vegetation dynamics can be simulated. The model, based on data from the White River National Wildlife Refuge near Dewitt, Arkansas, 'grows' individual trees on a 20 by 20 meter plot taking into account effects on the tree growth of flooding, depth to water table, shade tolerance, overtopping, crowding, and probability of death and reproduction. A potential application of the model is illustrated with simulations of tree fruit production following flood-control implementation and lumbering. (Kosco-USGS)

2J. Erosion and Sedimentation

A STOCHASTIC MODEL FOR PARTICLE SORTING AND RELATED PHENOMENA,
Geological Survey, Lakewood, CO. Water Resources Div.
B. M. Troutman.
Water Resources Research, Vol 16, No 1, p 65-76, February 1980. 11 Fig, 14 Ref.

Descriptors: *Sediments, *Sediment transport, *Particle size, *Model studies, Mathematical models, Stochastic processes, Rivers, Streams, Tributaries, Sediment sorting, Bottom sediments, Sedimentology.

A number of factors contribute to the variability in particle size distribution with position, or sorting, that is often observed in natural channels. Several of these factors are readily examined by using stochastic models of particle movement along a streambed. If particle position and particle size are treated as jointly distributed random variables, then sorting is reflected in the fact that the conditional distribution of size given position depends on the value of position. This conditional distribution is most easily derived by first postulating the form of the conditional distribution of position given size and of the marginal size distribution. Further, the effect of mixing particles from two or more distinct sources can be considered by examining the joint distribution of three random variables: size, position, and source. This is useful in predicting size distribution downstream from the point where a tributary enters a channel. Longitudinally varying transport conditions, which also contribute significantly to sorting, are conveniently modeled with a nonhomogeneous Poisson process. Here it is assumed that the particle motion consists of a sequence of steps of random length, each step followed by a rest period of random duration. It is the number of particle rest positions as a function of distance from the initial position that obeys a Poisson process, so the proposed model allows for systematic change of the step length and rest duration distributions with position downstream. THEORETICAL APPROACH TO PREDICTION OF LOCAL SCOUR AROUND BRIDGE PIERS,
Cambridge Univ. (England). Dept. of Engineering.
C. J. Baker.
Journal of Hydraulic Research, Vol 18, No 1, p 1-12, 1980. 4 Fig, 7 Ref.

Descriptors: *Scour, *Piers, *Theoretical analysis, *Mathematical models, Analytical techniques, Erosion, River beds, Alluvial channels, Flow characteristics, Vortices, Analysis, Sediments, Movement, Sediment transport, Depth, Local scour, Bridge piers, Clear water scour.

Formulae were derived that relate the equilibrium scour depth upstream of cylindrical bridge piers caused by horseshoe vortex systems to various flow parameters. Assumptions were made concerning the vortex size and shape during the scouring process and concerning the forces on particles within the scour hole. The derived formulae were found to be in good agreement with experimental results. (Humphreys-ISWS)

CHEMICAL AND SEDIMENT MASS TRANSFER IN THE GODAVARI RIVER BASIN IN INDIA,
Jawaharlal Nehru Univ. New Delhi (India). School of Environmental Sciences.
G. Bikshamaiah, and V. Subramanian.
Journal of Hydrology, Vol 46, No 3/4, p 331-342, April 1980. 4 Fig, 7 Tab, 21 Ref.

Descriptors: *Mass transfer, *Chemicals, *Sediments, *Sediment transport, Rivers, Watersheds(Basins), Runoff, Rainfall, Evaporation, Monsoons, Suspended solids, Dissolved solids, Salts, Discharge(Water), Hydrology, Sedimentology, *India, *Godavari River(India).

Mass transfer in the Godavari River is predominantly monsoonal since 95% of the total annual load is transported in the wet season. The annual denudation rate varies from one part of the basin to the other, but the basin as a whole is being eroded at a rate higher than that of the world global average. This may be due to the fact that 85% of the basin is covered by intensive human activity. While geology is a controlling factor from a quality point of view, discharge and elevation control quantitatively the annual mass transfer into the Bay of Bengal. The sediment load, representing physical weathering, is about seven times that of the chemical load. Monthly and annual variations in mass transfer as a function of time and space have been observed in the river basin. The annual mass transfer of the river is about 10% of that of the Himalayan drainage system. (Sims-ISWS)

SEDIMENT DISCHARGE IN THE SANTA CLARA RIVER BASIN, VENTURA AND LOS ANGELES COUNTIES, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
R. P. Williams.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-162951, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-78, August 1979. 51 p, 20 Fig, 8 Tab, 16 Ref.

Descriptors: *Sediment discharge, *River basins, *California, *Sediment yield, *Streamflow, Sampling, Measurement, Estimating, Sediment transport, Sediment load, Particle size, Bed load, Erosion control, Beaches, Hydrologic data, *Santa Clara River basin(Calif).

Sediment data collected in the Santa Clara River in California basin, during the 1967-75 water years were analyzed to determine the particle size and quantity of sediment transported past three gaging stations. The total sediment discharge of the basin, computed from records of Santa Clara River at Montalvo for water years 1968-75, was 63.5 million tons, of which 59.5 million tons was carried in suspension and an estimated 4 million tons was transported as unsampled sediment discharge. About 17.7 million tons, or 28 percent of the total sediment discharge, was coarse sediment (particles larger than 0.062 millimeter). Most of the sediment was transported during only a few days of flood-flow each year. During the 1968-75 water years, approximately 55 percent of the total sediment was transported in 2 days and 92 percent was transported in 53 days. The long-term (1928-75) average annual sediment discharge of the Santa Clara River at Montalvo is estimated at 3.67 million tons. Of that quantity, 2.58 million tons consisted of fine sediment and 1.09 million tons consisted of coarse sediment. A sediment budget for the Santa Clara River basin was estimated for sediment discharges under both natural and actual conditions. The major difference between natural and actual sediment discharges of the Santa Clara River basin is the sediment intercepted upstream from Lake Piru. The combined trap efficiency of Lake Piru and Pyramid Lake approaches 100 percent. Sediment deposited in these reservoirs resulted in about a 6-percent reduction of sediment to the Santa Clara River basin during the historical period (1928-75) and a 12-percent reduction during the period most affected by dams (1953-75). Sediment losses to the basin by gravel mining, diversion of flows, and interception of sediment in the Castaic Creek basin

resulted in additional reductions of 2 percent during the period 1928-75 and 4 percent during the period 1953-75. (Kosco-USGS)
W80-04856

SEDIMENT TRANSPORT BY THE WHITE RIVER INTO MUD MOUNTAIN RESERVOIR, WASHINGTON, JUNE 1974-JUNE 1976,
Geological Survey, Seattle, WA. Water Resources Div.
L. M. Nelson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A075 139, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-133, June 1979. 26 p, 7 Fig, 2 Tab, 5 Ref.

Descriptors: *Sediment transport, *Streamflow, *Reservoirs, *Washington, *Data collections, Discharge(Water), Sampling, Bed load, Particle size, Aggradation, Suspended load, Sediment discharge, *White River(Wash), *Mud Mountain Reservoir(Wash).

This reconnaissance evaluation of the sediment transport by the White River into the Mud Mountain Reservoir, in Washington, during the period June 1974-June 1976 showed that the river transported 430,000 tons of suspended sediment into the reservoir during the first year of the study and 1,400,000 tons in the second year. Daily mean suspended-sediment concentrations generally were less than 500 milligrams per liter; the highest daily mean concentration was 6,200 milligrams per liter on December 1, 1975. A good relation exists between daily suspended-sediment discharge and daily mean water discharge except during periods of runoff from glacial melt. Data from samples obtained by the use of the Helley-Smith bedload sampler indicate that the bedload measured using the sampler is about 4 percent of the suspended-sediment discharge. Potential deposition in the reservoir was estimated at 750 acre-feet during the 2 years of study. (Kosco-USGS)
W80-04857

SIMULATION OF RESERVOIR AND LAKE SEDIMENTATION,
Kansas Water Resources Research Inst., Manhattan.
W. M. Merrill, and Y. M. Chang.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182801, Price codes: A08 in paper copy, A01 in microfiche. Project Completion Report, April 1980. 144 p, 17 Fig, 7 Tab, 30 Ref, 2 Append. OWRT B-036-KAN(1), 14-31-0001-4085.

Descriptors: *Sedimentation, *Lake sediments, *Reservoir silting, *Sediment transport, Silt, Clay, Sediment distribution, Model studies, Simulation analysis, Computer programs, Alluvial streams.

In the course of an investigation of sedimentation in reservoirs, two lakes Decatur in Central Illinois and Kanopolis in west central Kansas, have been used to develop a model of reservoir sedimentation and two computer programs to simulate it. Data from a third lake, Harry E. Strunk in southwestern Nebraska, have been gathered to be used for further testing of the programs. Basis for the model is a statement of general relationships formulated by Sloss (1962) to describe sedimentation in shallow marine basins, modified to apply to relatively small freshwater bodies (Merrill and Chang, 1973). In its modified form, the statement serves as foundation for quantitative and semiquantitative expressions that are translated into algorithms to simulate reservoir processes. The model and programs are appropriate only for reservoirs established on alluvial streams in which an essentially unlimited supply of sediment, 90 percent or more of which is silt and clay and at least 30 percent of which is clay of two microns or less, can be assured. Movement of the water-sediment mixture, deposition, erosion, compaction, and the passage of time are incorporated in the simulation. Results of the simulation compare favorably to observed configurations in the reservoirs modeled. At least one of the hypotheses proposed to explain distribution of sediment in reservoirs probably can successfully be tested with these programs.

DISPERSION IN TWO-LAYER STRATIFIED WATER BODIES,
National Technical Univ., Athens (Greece). Applied Hydraulics Lab.
G. C. Christodoulou, and J. J. Connor.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY4, Proceedings Paper 15342, p 557-573, April 1980. 9 Fig, 19 Ref, 1 Append.

Descriptors: *Stratified flow, *Dispersion, *Mathematical models, *Tidal waters, Bays, Mixing, Stratification, Water quality, Distribution patterns, Model studies, Analytical techniques, Diffusion, Theoretical analysis, Numerical analysis, Finite element analysis, Bodies of water, Estuaries, Onsite investigations, *Massachusetts Bay, Two-layer model, Model verification.

A finite element model was developed for the numerical prediction of the dispersion process in a strongly stratified water body idealized as a two-layer system. The physical processes of mixing through the density interface and horizontal dispersion were discussed. Numerical integration in time is based on an implicit iterative trapezoidal scheme. Results for one-dimensional counterflow conditions were verified with analytical solutions The model was applied to a large dispersion experiment in Massachusetts Bay. Taking into account the initial spreading of the source and the uncertainties about the velocity field, good qualitative agreement was observed with respect to the location and peak values of the plume. The development of numerical techniques is outgrowing the present ability to define realistic inputs as well as the basic knowledge of some of the physical processes involved. Further fundamental research is needed for better understanding of the turbulent mixing process in stratified environments. Also, field monitoring programs are required to provide reliable inputs, primarily on the behavior of the interface along open boundaries. (Humphreys-ISWS)

Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182090, Price codes: A06 in paper copy, A01 in microfiche. Final Report to Office of Water Research and Technology, September 1979. 112 p. OWRT C-80278-S(No 8523)(1), 14-34-0001-8523.

Descriptors: *Reverse osmosis, *Membranes, *Sea water, *Desalination processes, *Membrane processes, Polyethylenimine, Isophthaloyl chloride, Polyimide membranes, Poly(Epichlorohydrin-secondary diamines).

Composite reverse osmosis membranes were formed with a polysulfone porous substrate. The membrane barrier layer was formed on this substrate by the interfacial polycondensation of polyethylenimine and isophthaloyl chloride. The barrier layer was shown to be capable of single stage seawater desalination in that selected membrane samples had a flux of 17 GFD and a rejection of 99% when operated on a feed-water containing 35,000 mg/l of sodium chloride at 800 psig and 75F . Manufacturing yields of this membrane would be expected to be low due to the poor quality of fabric carrier material which is available. Asymmetric polyimide membrane was developed further by optimization of casting formulations and conditions. When tested under seawater conditions as described above, the best results obtained were 5.8 GFD and 98.4% rejection. A composite membrane barrier layer was formed on polysulfone substrate interfacially with poly (epichlorohydrin-secondary diamines) and isophthaloyl chloride. The best results obtained with this membrane under seawater conditions were 9.6 GFD and 94% rejection.

APPLICATION OF CONTINUOUS HYDROLOGIC MODELING TO EVALUATE AND DESIGN WASTEWATER LAND DISPOSAL OR EVAPORATION SYSTEMS,
Kansas State Univ., Manhattan. Dept. of Civil Engineering.
J. J. Zovne.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-181050,

Price codes: A04 in paper copy, A01 in microfiche. Kansas Water Resources Research Institute, Kansas State University Project Completion Report, March 1980, 48 p, 11 Fig, 8 Tab, 7 Ref, 2 Append. OWRT A-090-KAN(1), 14-34-0001-8018.

Descriptors: *Hydrology, *Design, Lagoons, Evaporation, *Ponds, *Kansas, Monitoring, Water level fluctations, Soil moisture, Runoff, Percolation, *Water reuse, *Hydrologic model, *Land treatment systems, *Municipal wastewater, Wastewater disposal, *Irrigation.

The hydrologic design of land treatment systems has largely been accomplished by annual or semi-annual estimates of the disposition of the input wastewater load. The operation of these systems is, however, dependent upon daily variations in precipitation, evaporation, and land treatment/irrigation area water management. The subject of this report is a hydrologic model which has been developed to design these systems based upon a continuous simulation of the daily water budget of a storage pond and irrigation disposal area system. The user of this program would need to identify a nearby weather station having long-term daily precipitation and temperature records. He would also need to identify the soil type in the disposal area, and specify the storage pond size, the irrigation disposal rate, the crop or cover on the disposal area, and the level of available soil moisture when irrigation ceases. The model monitors the daily pond level fluctuations and overflows; soil moisture, runoff, and percolation in the disposal area; and gives monthly and annual summaries of all hydrologic variables. By manipulating sizes and rates, the user can design an optimal system. An example is given for the Kinsley, Kansas, system. The application of the model to evaluating State of Kansas nondischarging lagoon design procedures is also presented.

WASTEWATER RECYCLING: DEVELOPMENT OF PLANT DISEASE IN AN OLD FIELD ECOSYSTEM,
Michigan State Univ., East Lansing. Dept. of Botany.
K. Epstein, K. Ditz, and G. R. Safir.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-181043, Price codes: A03 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University, Project Completion Report, April 1980. 37 p, 9 Fig, 10 Tab, 36 Ref. OWRT A-097-MICH(1), 14-34-0001-8024.

Descriptors: *Wastewater irrigation, *Plant disease, Pathogens, Coleosporium solidaginis, Erysiphe cichoracearum, Phyllachora graminis, Helminthosporium, Sp, *Return flow, Recycling, Water pollution effects, *Filter sterilized wastewater, *Tapwater, Old field.

During 1978 and 1979, the threat of plant disease in a wastewater irrigation field dominated by goldenrod and quackgrass was assessed. Pathogens that were abundant in the wastewater irrigated areas, Coleosporium solidaginis, Erysiphe cichoracearum, Phyllachora graminis and Helminthosporium sp., alternate on economically important hosts. The increased disease in the irrigated areas seemed mainly due to moisture and disease severity was reduced by a midseason harvest. Levels of plant pathogens in the wastewater were apparently low since wounded seedlings of 12 varieties of 7 field crops soaked in wastewater remained healthy. There was no difference in the survival of Alternaria tensuis or Stemphylium sarcinaeforme after 24 days in filter sterilized wastewater or tapwater, but both Erwinia herbicola and E. atroseptica survived better after 24 hrs in wastewater than in tapwater.

Descriptors: *Aquifers, *Energy storage, *Cooling water, *Heated water, Non-consumptive use, Power plants, Peaking capacity, Heat balance.

Battelle's Pacific Northwest Laboratory will test the feasibility of using aquifers to store hot or cold water for later retrieval for heating or cooling. Advantages of aquifer energy storage include: (1) more efficient use of heat from solar energy and other alternative-energy systems that vary with seasonal or weather changes; (2) waste heat from factories or electric power plants is recovered, (3) cooling towers might be eliminated for some power plants; (4) it is non-consumptive use of water; (5) non-potable ground water can be used; (6) up to 95% of the original heat can be retrieved; (7) it can be used in conjunction with coal-fired heating systems to meet high energy demands during peak periods. Two other field studies are currently underway at Auburn University and the University of Minnesota, Minneapolis. A major conclusion of Battelle's program is that aquifer energy storage is ideal for a complex of adjacent buildings or a small community. While it would not have direct application on a regional basis, it could ease the regional power supply situation by helping reduce energy needed to offset seasonal changes in power demands. DRILLING FOR ENERGY ALTERNATIVES.
Ground Water Age, Vol 14, No 6, p 25, 44, February, 1980.

Descriptors: *Geothermal studies, *Drilling, *Geopressured aquifers, *Louisiana, Thermal water, Methane, High pressure, Well spacing, Land subsidence, Brine disposal, Oil wells, Coastal plains, Bayous.

According to the Louisiana Department of Natural Resources, as much as forty million gallons per well per day of geopressured water at temperatures from 250-400F can be withdrawn from the coastal zone aquifers. In addition, it is estimated that over 13.6 trillion standard cubic feet of dissolved methane gas is contained in these aquifers, and downhole pressures may attain one psi per foot of depth. Test wells are expected to exceed 10,000 feet in depth and cost about $10 million each. Disadvantages of geopressure drilling and production are: (1) wells must be widely spaced; (2) land subsidence could occur; (3) brine disposal may cause pollution; and (4) oil and gas production may be reduced. (Purdin-NWWA)
W80-04949

SALTY WASTE WATER--AN IRRIGATION SOURCE..
Ground Water Age, Vol 14, No 6, p 28, 30, February, 1980.

Descriptors: *Impaired water use, *Return flow, *Irrigation water, Water reuse, Brackish water, Cotton, Land reclamation, Leaching, Drainage, Drainage water, Saline soils, Halophytes, Salt tolerance.

A four-year study near Bakersfield, California will determine the yield of cotton irrigated with saline agricultural drainage wastewater, evaluate the extent of salt buildup in the soil, and determine if the soil can be desalinated by irrigating with low-salinity water. One reason for this study is the buildup of brackish irrigation water in the San Joaquin Valley. A drainage canal will eventually take the waste waters out of the valley, but to reduce the volume of water and the size of the canal, researchers are finding ways of using the water on a succession of salt tolerant crops. Under study will be low salinity water (200 ppm), high salinity water from a brackish well (5,800 ppm), and a mixture of the two (3000 ppm). Application rates will be adjusted to the salinity level of the water. Higher salinity water will require an extra amount which leaches salt below the root zone to minimize salt damage to the plants. 3D. Conservation In Domestic and Municipal Use

ANALYSIS OF THE WATER RATE STRUCTURE AS A MANAGEMENT OPTION FOR WATER CONSERVATION,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
J. W. Male, C. E. Willis, F. J. Babin, and C. J. Shillito.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182595, Price codes: A08 in paper copy, A01 in microfiche. Water Resources Research Center, University of Massachusetts, Publication No 112, 1979. 89 p, 4 Fig, 5 Tab, 35 Ref, 3 Append. OWRT-A-125-MASS(1), 14-34-0001-97023.

Descriptors: *Water conservation, *Water rates, *Pricing, *Water costs, *Cost analysis, Cost allocation, Cost-benefit analysis, Marginal costs, Water consumption, Average costs, Declining average costs, Elasticity of water demand, Water management(Applied), Water meters, Meter reading routing, *Potable water.

The objective was to assess the potential for residential water conservation by altering the price structure. This document reports on the general consumer responsiveness to variations in water price structure and on an application to one case study. Consumer responsiveness was assessed by applying an ordinary least squares regression analysis to three different functional forms each containing the water price, median income, number of persons per meter, and population density as independent variables. The analyses yielded a range of price elasticities, with the exponential functional form yielding a median value of -.37. Results of the general analysis were applied to a case study to estimate the degree of consumer responsiveness to three different rate structures. Results showed an estimated reduction of residential demand of approximately 15 percent for a three month water short period. In addition to the demand estimates several practical matters were considered which would affect the implementation of water conserving rate structures. These include equity among users (including non-residential) and water meter reading and billing practices. A systematic method

for determining meter reader routes was outlined and billing practices which might aid in water conservation were suggested. (Godfrey-Mass)

3F. Conservation In Agriculture

MANAGEMENT OF SUMMER-SEASONAL IRRIGATION WATER IN BEEF COW/CALF AGRICULTURE IN THE SIERRA NEVADA FOOTHILLS,
California Univ., Davis. Dept. of Agronomy and Range Science.
C. A. Raguse, and W. A. Williams.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180920, Price codes: A02 in paper copy, A01 in microfiche. California Water Resources Center, University of California, Davis Technical Completion Report, March 1980, 6 p, 1 Fig, 3 Tab. (California Water Resources Center Project UCAL-WRC-W-495). OWRT-B-175-CAL(5).

Descriptors: *Range management, *Economic feasibility, *Economic efficiency, Grazing, *Linear programming, Model studies, Microenvironment, Conservation, *Irrigation water, *Irrigation efficiency, California, *Sierra Nevada foothills.

Efficient agricultural production in the Sierra Nevada foothills is generally achieved only through the use of the grazing animal. Economically this region has a comparative advantage, for the production of beef calves, over regions of intensive agriculture. Grazing is also an appropriate biological tool for land management in the nonagricultural interests of the general public. Use of seasonally available irrigation water for perennial and annual forages was evaluated in terms of biological yield and economic feasibility. These forages could be used to supplement winter- and spring- growing annual range. A linear programming model for resource allocation was developed. Emphasis was given to achieving maximum user-level flexibility in assigning values-such as land and forage classes, length of season and animal requirements-to the various assumptions of the model. Management practices which modify the soil-plant microenvironment can affect plant vegetative regeneration, dry matter production and symbiotic nitrogen fixation. The effects of various factors including light, temperature and phosphorous levels were studied in controlled environment facilities and in the field. (Snyder-Calif)
W80-04803

GROWTH OF SUBTERRANEAN CLOVER IN A RANGE SOIL AS AFFECTED BY MICROCLIMATE AND PHOSPHORUS AVAILABILITY. III. COMPARATIVE GROWTH OF SUBTERRANEAN AND ROSE CLOVERS AT COLD SOIL TEMPERATURES,
California Univ., Davis. Dept. of Agronomy and Range Science.
C. A. Raguse, and K. L. Taggard.
Agronomy Journal, Vol 71, p 523-528, July-August 1979. 4 Fig, 4 Tab. (California Water Resources Center Project UCAL-WRC-W-495). OWRT-B-175-CAL(6).

Descriptors: *Red clover, *Clovers, *Legumes, *Soil temperature, *Climates, *Growth rates, *Environmental control, Temperature, Rainfall, Ranges, Range management, Environmental effects, Nitrogen fixation, Soil-water-plant relationships, Winter, Range grasses.

The biological yield potential of winter annual range legumes is influenced by the timing of rainfall adequate to ensure germination. If rains are late, the establishment phase of growth must occur at cold soil and air temperatures. On low-P soils, this combination of abiotic factor constraints can limit symbiotic N fixation. Three controlled-environment experiments were conducted to compare the seedling growth of rose clover and subterranean clover on a P-deficient soil, simulating winter conditions of cold soils and low light. Comparative growth responses, especially intraplant dry matter partitioning and nodulation, were observed for several soil P availability levels. A sunlit phytotron provided a common shoot environment of seasonal (fall/winter) ambient light intensity and photoperiod, with a programmed smooth diurnal temperature cycle of 20C maximum and 5C minimum. Three independently-controlled water baths maintained soil temperature experiments at a constant 5C, a constant 10C, and a diurnal 5C to 10C alternation. Phosphorus levels were 0, 45, 90, and 180 kg/ha equivalents. Growth intervals (5 + or - 0.5 trifoliate-leaf stage), varied between 58 and 114 days. The results suggest that while the practical soil threshold temperature for overall growth is near 5C, some intraplant growth processes may proceed, but only at adequate availability levels of mineral nutrients. (Snyder-California)

CORN RESPONSE TO AMMONIACAL NITROGEN UNDER VARYING LEVELS OF MAGNESIUM AND POTASSIUM FERTILITY,
Delaware Univ., Newark. Dept. of Plant Science.
M. R. Teel, W. H. Mitchell, A. L. Morehart, and D. K. Brauer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182124, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Center, University of Delaware Completion Report, April 1980, 32 p, 17 Tab. OWRT A-039-DEL(1), 14-34-0001-8008.

Descriptors: *Crop response, *Ammonification, *Nitrogen, *Subsoil, *Experimental forms, Lime, Corn(Field), Cover crops, Rye, Irrigation, Evaluation, Magnesium, Potassium.

Eight nitrogen treatments, varying with respect to nitrogen source (ammonium versus nitrate), and method of application, were compared with corn (Zea Mays L.) under four levels of potassium (0, 50, 100 and 200 lbs. K20/acre/yr as KCl) within each of three lime regimes (no lime, dolomitic, or calcitic lime). The research was conducted during the growing seasons of 1976 - 1979. Salient data from the 1978 and 1979 seasons are reported. A randomized split-split block design was used, replicated three times, with lime sources as main plots; potassium levels as sub plots, and nitrogen treatments as sub-sub plots. Nitrogen was applied in split applications either broadcast in granular form or injected as a solution into the water system used for subsurface irrigation (SSI). Sodium nitrate (NaN03) and urea (C0-(NH-2)2) were used as sources of nitrate (N0-3) and ammonium (NH+4) nitrogen respectively. Urea was injected both with and without Nitrapyrin, (2-choro-6-(trimethyl)-pyridine, at two percent of the nitrogen rate. The level of exchangeable NH+4 found on August 8, and October 29, 1978 was significantly increased by addition of this nitrification inhibitor. Residual NH4 from the 1978 treatments increased both leaf N and dry matter production in the succeeding rye cover crop. Corn grain yields were not significantly influenced by potassium treatments due chiefly to inherently high potassium fertility on the test site. Nitrogen source effects varied with both lime and irrigation treatments.

THE USE OF THE CLIMATIC WATER BUDGET IN IRRIGATION SCHEDULING: IOWA,
Delaware Univ., Newark. Dept. of Geography.
J. R. Mather, and A. DeNardo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182140, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Center, University of Delaware Report, July 1978. 25 p, 2 Fig, 1 Tab, 2 Append. OWRT A-040-DEL(7), 14-34-0001-9008.

Descriptors: Irrigation, *Water budget, *Irrigation programs, Iowa, *Agroclimatology, *Irrigation scheduling, Water utilization, Evapotranspiration, Precipitation(Atmospheric).

Scheduling the correct amount of supplemental irrigation is a problem facing all irrigators. While various techniques have been developed to permit calculation of time and amount of irrigation needs, most are so complex or require so many data that they cannot be evaluated by the individual farmer or irrigation operator. A simplified irrigation scheduling procedure using average information on the climatic demand for water (evapotranspiration) and the precipitation as measured at the particular irrigation site is described. While the approach can be applied anywhere, this primer provides evapotranspiration information only for Iowa. Sample worksheets for irrigation scheduling are included.

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

THE USE OF THE CLIMATIC WATER BUDGET IN WATER RESOURCES MANAGEMENT AND CONTROL,
Delaware Univ., Newark. Dept. of Geography.
J. R. Mather.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180623, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Center, University of Delaware, Research Technical Completion Report, November 1979. 8 p. OWRT A-040-DEL(2), 14-34-0001-9008.

Descriptors: *Hydrologic budget, *Water balance, *Climatology, *Water management, Irrigation, Streamflow, Landfills, Leaching, Land use effects, Computer models.

Comparison of the monthly or daily climatic supply of water (precipitation) with the climatic demands for water (evapotranspiration) in a water budget accounting framework results in quantitative information on such factors as recharge of water to the water table, streamflow, irrigation need, and storage of moisture in the soil. The information is needed by planners, engineers, agriculturalists, hydrologists and others who are concerned with water resources and their modification by human or natural actions. The results of the study have been presented in a series of primers which describe how the climatic water budget can be adapted to solve particular water problems. Each of the primers is complete, containing all of the information and tables needed to evaluate the water budget along with detailed instructions on how the water budget information can be used in the particular example. Titles of the six primers are: WATBUG: A FORTRAN IV Algorithm for Calculating the Climatic Water Budget; The Use of the Climatic Water Budget in Irrigation Scheduling: Iowa; The Use of the Water Budget in Evaluating Leaching Through Solid Waste Landfills; The Influence of Land-Use Change on Water Resources; Use of the Climatic Water Budget to Estimate Streamflow; The Use of the Climatic Water Budget to Evaluate the Validity of a Precipitation Record.

4B. Groundwater Management

WATER-RESOURCES DATA COLLECTED IN THE DEVILS HOLE AREA, NYE COUNTY, NEVADA 1976-77,
Geological Survey, Carson City, NV. Water Resources Div.
R. L. Carson.
Available from: OFSS Box 25425, Fed. Ctr. Denver, CO 80225, Paper copy $3.24, Microfiche $3.50. Geological Survey open-file report 79-742, 1979. 22 p, 9 Fig, 2 Tab, 7 Ref.

Descriptors: *Basic data collections, *Groundwater resources, *Nevada, *Spring waters, *Water level fluctuations, Irrigation, Pumping, Irrigation wells, *Devils Hole area(Nev), Fish, Endangered species, *Pupfish.

This report presents water data collected in Devils Hole and vicinity from July 1976 through June 1977 for the purpose of observing the effects of irrigation pumping on the pool level in Devils Hole, Nye County, Nevada. The pool contains the endangered species of pupfish, Cyprinodon diabolis. The report presents changes in water level and springflow in graphic form and tabulates electric energy consumed by irrigation wells as an index of the pumpage. (Kosco-USGS)

BOREHOLE GEOPHYSICS IN IGNEOUS AND METAMORPHIC ROCKS,
Geological Survey, Denver, CO. Water Resources Div.
W. S. Keys.
In: Transactions of Twentieth Annual Logging Symposium, Society of Professional Well Log Analysts held in Tulsa, Oklahoma, June 3-6, 1979. 26 p, 21 Fig, 1 Tab, 12 Ref. Society of Professional Well Log Analysts, Houston, Texas.

Descriptors: *Borehole geophysics, *Ingenous rocks, *Metamorphic rocks, *Logging(Recording), Wells, Computer models, Geothermal studies, Exploration, Radioactive wastes, Fractures(Geologic), Thermal water, Borehole cameras, Hydrogeology.

Activities in geothermal energy, radioactive and industrial waste disposal, mineral exploration, engineering geology, and lunar and deep crustal exploration have increased the need for borehole geophysics in igneous and metamorphic rocks. Because there is a lack of knowledge and experience in the application of borehole geophysics to these rocks, the U.S. Geological Survey is conducting research in this area. Igneous and metamorphic rocks usually present different petrophysical properties, such as porosity, density, resistivity, and mineralogy, than do sedimentary rocks. For this reason all conventional geophysical logging techniques may not be useful and petrophysics must be used to develop appropriate methods of log analysis. Core analyses plotted against log response and crossplotting of various logs in the computer are particularly useful for identifying the various rock types in an igenous complex. Hydrothermal alteration and fluid movement through fractures are very important parameters that are needed from logs. Hydrothermal alteration may be recognized on well logs through the use of crossplots and borehole gamma spectrometry. The acoustic televiewer supported by other logs has been highly successful for identifying fractures that are transmitting either hot or cold water. (Kosco-USGS)

WATER DISTRICT'S NEEDS ARE MET,
UOP, Inc., St. Paul, MN. Johnson Div.
G. M. Erickson.
The Johnson Drillers Journal, Vol 52, No 1, p 2-3, January-February, 1980. 1 Fig.

Descriptors: *Subsurface investigations, *Drilling, *Ground water resources, *Kentucky, Water wells, Water districts, Rural water, Aquifer testing, Drawdown, Transmissivity, Specific capacity, Well fields, Safe yield, Ohio River, Sand aquifers, Test wells, Groundwater potential, Aquifer management.

The Ohio River-Oldham Water District of northeastern Kentucky engaged the Reynolds Company of Louisville to search for ground water sources near Westport. A good coarse sand and gravel aquifer was located and tested. A 32-inch diameter well was drilled by revere circulation. The well screen and gravel pack were specially designed and constructed to maximize the transmitting capacity to nearly 1500 gpm. Results of the aquifer test indicated a transmissivity of 40,000 to 45,000 gpd per ft and a specific capacity of 19.45 gpm per ft. of drawdown indicating a well efficiency of 85 percent. A test well, drilled closer to the Ohio River indicated that the aquifer became thinner and finer. Three more test wells were drilled in order to fully explore the well field potential. Based on the results of this exploration program, the Ohio River-Oldham Water District now has four completed production wells with safe yields as high as 1.7 mgd and totaling 5.5 mg. (Purdin-NWWA)
W80-05082

THE CASE FOR ARTIFICIAL RECHARGE,
Igrea Group, C.A., Caracas (Venezuela).
J. M. Espina.
The Johnson Drillers Journal, Vol 52, No 1, p 7-11, January-February, 1980. 1 Fig.

Descriptors: *Artificial recharge, *Ground water recharge, Water spreading, Pit recharge, Furrow systems, Injection wells, Induced infiltration, Recharge wells, Aquifers, Clogging, Benefits, Water storage, Conjunctive use, Surface-ground water relationships.

Artificial recharge can be used for waste disposal, secondary oil recovery, land subsidence problems, salt-water intrusion control, and ground water storage. Various methods of artificial recharge include: water spreading, pit recharge, excavations, wells and shafts, and pumping. Water spreading can be done in a basin, a series of ditches or furrows, a natural stream channel, or irrigation canals. Alternating wet and dry periods in a basin results in greater total recharge than continuous spreading. Water spreading is not effective in areas where subsurface strata restrict the downward passage of water or where the cost of land is prohibitive. In these areas recharge can be conducted through injection wells. Recharge rates rarely equal pumping rates due to clogging of the aquifer with silt and bacteria. Induced recharge involves pumping of ground water from a well adjacent to a lake or stream and can result in high-quality water. The tangible and intangible benefits of artificial recharge are outlined along with the physical requirements for appropriate storage, movement and use of recharge water. The major alternative, surface storage, costs more to construct and is subject to evaporation losses and seasonal availability of water. (Purdin-NWWA)

4C. Effects On Water Of Man's Non-Water Activities

THE INFLUENCE OF LAND-USE CHANGE ON WATER RESOURCES,
Delaware Univ., Newark. Dept. of Geography.
J. R. Mather.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180904, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Center, University of Delaware, Technical Research Report, June 1979. 60 p, 3 Fig, 14 Tab, 9 Ref, Append. OWRT A-040-DEL(6), 14-34-0001-9008.

Descriptors: *Land development, *Effects, *Groundwater, *Water table, Land use, Land clearing, Hydrologic budget, Water balance, Groundwater recharge, Runoff, Overland flow, Streamflow, Climatology.

This report provides detailed examples of the hydrologic consequences of two specific land-use changes. The first involves the effect on streamflow of a gradual change from cultivation to suburbanization in a basin near Wilmington, Delaware, while the second involves the effect on recharge to the water table of introducing a suburban housing development in a formerly agricultural and wooded tract. Both examples make use of information developed from the climatic water budget. In the first example, it is found that the gradual change from forest and cultivation to suburbanization has resulted in a progressive increase in stream runoff averaging about 0.04 inch per year over the past 30 years. In the second example, increasing the amount of impervious surfaces decreases ground water recharge. In order to have no detrimental effect on the water table recharge, detention (by means of some sort of infiltration basins or ponds) of about one-half of the water falling on impervious surfaces in the housing development is necessary in order for the water table recharge after development to equal the recharge before development.

4D. Watershed Protection

SUSPENDED SEDIMENT FROM FOREST ROAD CONSTRUCTION,
Washington Univ., Seattle. Coll. of Forest Resources.
D. D. Wooldridge, and A. G. Larson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180508, Price codes: A05 in paper copy, A01 in microfiche. State of Washington Water Research Center, Washington State University, Pullman Project Completion Report October 15, 1978, Revised January 1980. 78 p, 14 Fig, 2 Tab, 14 Ref, 1 Append. OWRT A-088-WASH(1).

Descriptors: *Suspended load, *Sediments, *Forest management, *Road construction, Washington, Turbidity, Suspension, Sediment control, Rainfall-runoff relationships, Water sampling, Precipitation(Atmospheric), Erosion, Grading, Roadbanks.

Concentrations and total quantities of suspended sediment in portions of Fly Creek, an undisturbed tributary of the Clearwater River in western

Washington, were studied during the construction of 1.4 miles of unpaved forest road in the watershed. Fly Creek is a Class A, Excellent, stream with a watershed of 649 acres. Approximately 90% of the 140 to 200 inches of annual precipitation becomes streamflow. The road was constructed in accordance with the Best Management Practices defined by the Washington State Forest Practices Rules and Regulations. Sediment concentrations were determined from water samples taken with ISCO automatic samplers that withdraw 500 ml of water at selected intervals. Only visually turbid samples were analyzed and suspended sediment was measured in mg/l. In the laboratory, a Hach model 2100A turbidometer was used to determine the turbidity. Results show that suspended sediment increased both during and after road construction and that sediment concentrations from the construction were related to the proximity of the construction to the stream and the occurrence of rainfall. Sediment increases were small during construction or log hauling during periods without rainfall. Sediment increases were not dependent on work hours or stream discharge. Sediment increases generally occurred on days after construction or hauling was stopped due to rain. A major impact of the road construction was the rapidness with which rainfall causes the suspended sediment increases. (Seigler-IPA)

ANALYSIS OF GROUND WATER BY DIFFERENT LABORATORIES -- A COMPARISON OF CHLORIDE AND NITRATE DATA, NASSAU AND SUFFOLK COUNTIES, NEW YORK,
Geological Survey, Syosset, NY. Water Resources Div.
B. G. Katz, and R. K. Krulikas.
Geological Survey open-file report 79-1063, 1979. 8 p, 2 Fig, 2 Tab, 6 Ref.

Descriptors: *Groundwater, *Analytical techniques, *Laboratory tests, *Water quality, *Water pollution sources, Chlorides, Nitrates, Water wells, Sampling, Statistical analysis, New York, *Nassau County(NY), *Suffolk County(NY).

Water samples from wells in Nassau and Suffolk Counties were analyzed for chloride and nitrate. Two samples were collected at each well; one was analyzed by the U.S. Geological Survey, the other by a laboratory in the county from which the sample was taken. Results were compared statistically by paired-sample t-test to indicate the degree of uniformity among laboratory results. Chloride analyses from one of the three county laboratories differed significantly (0.95 confidence level) from that of a Geological Survey laboratory. For nitrate analyses, a significant difference (0.95 confidence level) was noted between results from two of the three county laboratories and the Geological Survey laboratory. The lack of uniformity among results reported by the participating laboratories indicates a need for continuing participation in a quality-assurance program and exercise of strong quality control from time of sample collection through analysis so that differences can be evaluated. (Kosco-USGS)

APPLICATION OF ENZYME METHODS TO THE DETERMINATION OF POLLUTANTS IN WATER,
Nebraska Univ., Lincoln. Dept. of Food Science and Technology.
K. M. Shahani.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-181167, Price codes: A03 in paper copy, A01 in microfiche. Nebraska Water Resources Center, University of Nebraska Project Completion Report, March 1980. 27 p, 3 Fig, 15 Tab. OWRT A-040-NEB(3), 14-34-0001-5027.

Descriptors: *Enzymes, Whey, Immobilized enzymes, Alcohol, *Pollutants, *Sewage effluents, Streams, Sampling, Biochemical oxygen demand.

Composite sewage samples were collected from a local dairy's effluent stream and analyzed for proximate composition, pH and BOD. Of the total BOD, lactose contributed 60%, protein 25% and lipid 15%. Enzymatic hydrolysis of these components increased the initial rate of utilization by the sewage microflora, but had no significant effect on the five-day BOD. The enzymes lactase, papain and lipase were immobilized either singly or together on a derivitized Sepharose solid support and used for the hydrolysis of lactose, protein and lipid in whey. Immobilization increased the stability of the enzymes without significantly altering their activity, pH optimum, temperature optimum or kinetic parameters. This multi-enzyme immobilized system offers promise for preparation of a hydrolyzed whey product. Proteins were recovered by precipitation with salt or heat or by ultrafiltration and the resultant permeate subjected to further reclamation. An immogilized lactase system was used for the continuous hydrolysis of the lactose in the permeate. The hydrolyzed product was quite sweet and could be used as a food grade syrup. The lactose in the whey permeate was converted to alcohol by the yeast Kluyveromyces fragilis. The permeate was used alone or in combination with grain to produce industrial alcohol for use in gasohol. Substitution of the whey for part of the grain mash water added additional fermentable carbohydrate and allowed a 15% reduction in grain with no decrease in alcohol production.

WATER ANALYSIS IN SOUTH AFRICA: INTERLABORATORY COMPARISON STUDIES. PART VI: BORON, SILICON, MBAS, CYANIDE, PHENOL, SULPHIDE, BOD, COLOUR AND TURBIDITY, ANALYSES,
National Inst. for Water Research, Pretoria (South Africa).
R. Smith.
Water S. A., Vol 6, No 1, p 31-36, January 1980. 4 Tab, 13 Ref.

Descriptors: *Water quality, *Laboratory tests, *Water analysis, *Analytical techniques, Turbidity, Boron, Silica, Phenols, Sulfides, Biochemical oxygen demand, Statistical methods, Laboratory equipment, Color, Standards, Instrumentation, Reliability, South Africa.

Synthetic water samples were analyzed in 14 South African laboratories for interlaboratory comparison of results on nine water quality parameters. The parameters were boron, silicon, methylene blue active substances (MBAS), cyanide, phenol, sulfide, biochemical oxygen demand (BOD), color, and turbidity. Laboratories were allowed complete freedom of choice in the selection of analytical procedures used. Laboratories were supplied with 250 cu cm samples and were assigned code numbers known only to that laboratory and to the study originator. Not all laboratories tested for all parameters. Collected results were reviewed for outliers using the ASTM procedure and were then analyzed for mean, mean error, relative mean error, standard deviation, and coefficient of variation. Using statistical procedures 80% of the results were found to be acceptable, 20% acceptable but questioned, and no results were unacceptable. Brief descriptions are given for each parameter including how many laboratories tested for it, methods used, and equipment used. Recognized standard methods or slight modifications were generally used and overall satisfactory results were obtained. The relative reliability of analytical methods for cyanide, phenol, sulfide, and BOD could not be determined due to insufficient results. For MBAS determination is recommended that linear alkylate sulfonate be used as the standard reference material. For turbidity determination the use of the Hach Turbidimeter Model 2100 or 2100A is recommended. (Seigler-IPA)

WATER ANALYSIS IN SOUTH AFRICA: INTERLABORATORY COMPARISON STUDIES. PART VII: CONCLUSIONS,
National Inst. for Water Research, Pretoria (South Africa).
R. Smith.
Water S. A., Vol 6, No 1, p 37-40, January 1980. 2 Tab, 11 Ref.

Descriptors: *Water quality, *Laboratory tests, *Water analysis, *Analytical techniques, Statistical methods, Laboratory equipment, Standards, Instrumentation, Reliability, Water pollution, Testing procedures, Evaluation.

Interlaboratory comparison studies involving the analysis of synthetic water samples by 18 laboratories in South Africa were conducted from 1976 through 1978. In all 48 water quality parameters were assessed although all parameters were not analyzed in all laboratories. The specific parameters and the number of laboratories participating are given. Results from each laboratory were statistically assessed and compared to develop a comprehensive picture of the state of water analysis in South Africa. The testing laboratories used a wide variety of both standard and non-standard methods. Due to this variety it is recommended that a recognized set of standard methods for water and waste water analysis be developed. Overall results were good and all laboratories participating would qualify for certification in the Oklahoma laboratory certification program. Specific findings and recommendations include: (1) pH and alkalinity should be determined immediately after opening the sample container; (2) specific conductance determinations should be carried out at 25C; (3) for total alkalinity determination potentiometric titration should be used for more accurate results; (4) for arsenic and selenium determinations by atomic absorption, sodium borohydride should be used as the hydride generant; and (5) for turbidity a Hach Turbidimeter Model 2100 or 2100A should be used. Participating laboratories are listed. (Seigler-IPA)

TEMPERATURE AND ADAPTATION TO POLLUTION AS FACTORS INFLUENCING THE ACUTE TOXICITY OF CD TO THE PLANKTONIC COPEPOD ACARTIA CLAUSI,
Athens Univ. (Greece). Zoological Lab. and Museum.
M. Moraitou-Apostolopoulou, G. Verriopoulos, and P. Palla.
Tethys, Vol 9, No 2, p 97-101, 1979. 1 Fig, 2 Tab, 29 Ref.

Descriptors: *Bioassay, *Cadmium, *Copepods, Water temperature, Adaptation, Lethal limit, Toxicity, Mortality, Zooplankton, Bioindicators, Heavy metals, *Acartia.

Static acute toxicity bioassays were conducted with Cd Cl2,2H20 using adult females of the planktonic Copepod A. clausi. The experiments were run at two temperatures: 14 + or - 0,5C and 22 +

or - 0,5C on natural Copepods assemblages from two different locations: one from an area polluted with industrial effluents and domestic wastes and another one from a relatively clean area. Results of cadmium toxicity tests, expressed as LC 50 48 hours, indicate a significant difference in the tolerance to cadmium between the two populations. Furthermore, for both populations the increase in temperature from 14 to 22C resulted in a two fold increase in the sensitivity of Acartia to cadmium. (Deal-EIS)

FIRST RECORD OF A BLOOM OF GONYAULAX MONILATA IN COASTAL WATERS OF MISSISSIPPI,
Gulf Coast Research Lab., Ocean Springs, MS.
H. M. Perry, K. C. Stuck, and H. D. Howse.
Gulf Research Reports, Vol 6, No 3, p 313-316, 1979. 3 Fig, 10 Ref.

Descriptors: *Dinoflagellates, *Red Tide, *Gulf of Mexico, Mississippi, Marine algae, Coastal waters, Growth rates, Water temperature, Salinity, Nuisance algae, Cytological studies, Florida, Alabama, Louisiana, *Gonyaulax, Public health.

Data are presented on a bloom of the toxic dinoflagellate Gonyaulax monilata in coastal waters of Florida, Alabama, Mississippi and Louisiana. The initial outbreak of the G. monilata bloom followed a period of lowered salinities in Mississippi Sound due to heavy rains associated with Hurricane Bob (11 July) and Tropical Storm Claudette (23 July). Surface temperatures and salinities during the bloom ranged from 30.0 to 30.8C and 24.0 to 26.0 ppt, respectively. Extensive blooms of G. monilata occurred in Florida and Alabama concurrent with the Mississippi outbreak. This is the first record of a bloom of this species in Mississippi and adjacent Gulf of Mexico. (Deal-EIS)

EFFECTS ON FISH EXPOSED TO EFFLUENT FROM A TITANIUM DIOXIDE INDUSTRY AND TESTED WITH ROTATORY-FLOW TECHNIQUE,
Institutet for Vatten- Och Luftvardsforskning, Stockholm (Sweden).
K-J. Lehtinen.
Ambio, Vol 9, No 1, p 31-33, 1980. 2 Fig, 2 Tab, 20 Ref.

Descriptors: *Toxicity, *Fish behavior, *Metals, Chemical wastes, Industrial wastes, Perches, Analytical techniques, Methodology, Fish physiology, Animal metabolism, Animal pathology, Mode of action, *Titanium, *Bleak, *Alburnus, Titanium dioxide industry.

It has become evident that such traditional field methods as calculations of species diversity and determinations of biomass in a polluted area are insufficient when the ecological effects of pollutants are to be determined. For this, a method which will detect some physiological malfunction is needed as a complement to traditional field methods. This paper deals with the performance of fish exposed to effluent from a titanium-dioxide industry. A total of 120 fish of two different species were exposed for 14 and 28 days to various concentrations of the effluent and then tested by means of the 'rotary-flow' technique. They displayed a statistically significant decrease in ability to compensate for torque in the rotating current. This is considered to indicate neuromuscular dysfunction and/or other physiological impairment. The most visible effect of the effluent was a brown precipitate on the gills. Fish from the area affected by the factory discharge are known to have a similar precipitate on the gill epithelium. (Deal-EIS)

A ROUTINE WATER MONITORING TEST FOR MUTAGENIC COMPOUNDS,
Illinois Univ. at Urbana-Champaign. Inst. for Environmental Studies.
J. B. Johnston, and J. N. Herron.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-181761, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Center, University of Illinois Research Report 141, May 1979, 94 p. S-057-ILL.

Descriptors: *Mutagens, *Ames assay, *Parfait/distillation method, Potable water, *Surface waters, Water analysis, Chemical analysis, Mutagenic chemicals, Water pollution, Public health, *Carcionogens.

The development of a simple, relatively comprehensive method for the recovery of nonvolatile mutagenic compounds from surface waters is described. The method recovers compounds by sequential passage of the water sample through a silica gel bed, then a cation-exchange bed, and then an anion-exchange bed - all contained in a single multi-bed column of glass and teflon, the parfait column. Nonvolatile compounds not adsorbed to any of these beds were recovered following concentration of the column effluent by vacuum distillation at < 30 degrees. The beds of the parfait column were separated and eluted independently. Using the Ames Salmonella/microsome reversion assay, each residue was assayed for mutagenic activity. The method was evaluated by recovery of five known mutagens, benzo(a)pyrene, 4-nitroquinoline-1-oxide, ethidium bromide, nitrofurylfuramide, and solium azide, each initially spiked into a sample of laboratory deionized water and an environmental water sample to a final concentration of less than 3ppb. The method has been used to survey ten Illinois surface waters for naturally occurring mutagenic activity. The parfait/distillation method differs from other techniques for the recovery of waterborne mutagens in its emphasis on the recovery of nonvolatile compounds and neutral water-soluble compounds. This method has also detected a significant mutagenic activity in samples as small as 2 gallons of water, a volume consumed by a normal person every few days.

Experiments studying phosphate of ammonium additions to green alga Scenedesmus quadricauda cultures deficient in phosphorus (P) or nitrogen (N), show that photosynthetic responses cannot reliably be used in short-term enrichments, rather changes in dark respiration or ATP are useful. Enrichment experiments involving small water volumes and population growth do not measure real but only potential nutrient limitations after other limiting factors, natural loading and regeneration have been removed. Experiments suffer from changing species composition and declining growth rates. To determine nutrient deficiencies actually present in a population, physiological indicators need to be measured. Photosynthetic responses are not appropriate. On the basis of experiment results, changes in dark respiration or ATP content are appropriate responses in some situations. The present results are confined to growth of Scenedesmus quadricuada the first eight h following addition and therefore indicate only possible solutions. The deficient nutrient is rapidly taken up. Light-saturated net photosynthesis is depressed below pre-addition rates during nutrient uptake and does not increase until several hours after uptake is complete. Dark respiration, on the other hand, is markedly stimulated during nutrient uptake and to a lesser extent after uptake is complete. Phosphate addition to P-deficient cells cause large increases in ATP content within 2-4 h of addition, whereas ammonium addition to N-deficient cells causes much less or no increase in ATP content. DISTRIBUTION AND ABUNDANCE OF LOW MOLECULAR WEIGHT HYDROCARBONS AND SUSPENDED HYDROCARBONS IN COOK INLET, ALASKA,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
J. Cline, C. Katz, and A. Young.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol V, Receptors--Microbiology, Contaminant Baselines, p 264-325, October 1979. 28 Fig, 2 Tab, 40 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Aromatic compounds, *Toxicity, *Natural gas, *Pollutant identification, Water pollution effects, Resources development, Environmental effects, Baseline studies, Oil pollution, Alaska, *Outer Continental Shelf, Cook Inlet, Crude oil, Hydrocarbons, Anthropogenic sources, Petroleum development, Toxicants.

During the past two years, emphasis has shifted toward sources of low molecular weight (LMW) hydrocarbons in Cook Inlet, including both natural and anthropogenic sources. Special attention has been devoted to sources of LMW aromatics in upper Cook Inlet and the fate of these compounds. Specialized studies in Cook Inlet have continued on the air-sea exchange of LMWH and in-situ production of gases in both the water column and from the underlying sediments. These data provide necessary information for the identification and sources of petroleum-like hydrocarbons in the waters of Cook Inlet. These studies were enacted to characterize the dissolved LMW natural hydrocarbons in Cook Inlet, Alaska. The purpose was to establish concentration levels and temporal and spatial variability of hydrocarbon components common to petroleum or natural gas resources prior to actual production. These measurements were felt to be an invaluable precursor to future monitoring efforts. The principal concern surrounding the distributions, sources, and sinks of LMWH is not their direct impact on biota, but rather their role as tracers of more toxic hydrocarbon fractions commonly found in crude oils. The principal goal is to provide the criteria for an early warning detection of petroleum-derived hydrocarbons and to establish the feasibility of using light hydrocarbons as tracers, particularly in reference to near-bottom mixing and resuspension processes. 5B. Sources Of Pollution

TRACE METALS IN SUSPENDED PARTICULATES, BIOTA, AND SEDIMENTS OF THE ST.

CROIX, NARRAGUAGUS, AND UNION ESTUARIES AND THE GOOSE COVE REGION OF PENOBSCOT BAY,
Maine Univ. at Orono. Dept. of Oceanography.
L. K. Fink, A. B. Harris, and L. L. Schick.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-181456, Price codes: A05 in paper copy, A01 in microfiche.
Maine Land and Water Resources Center Maine University Completion Report. April 1980. 296 p, 177 Fig, 22 Tab, 32 Ref. OWRT A-041-ME(1) and B-015-ME(1).

Descriptors: *Maine, *Estuaries, *Heavy metals, *Water pollution sources, Water quality, Sediments, Suspended solids, Biota, Agricultural runoff, Mining, Industrial wastes, Sewage effluents, Spectrophotometry, Watersheds(Basins), Brackish water.

Samples from four Maine estuaries were analyzed to determine the concentrations, distributions, and sources of heavy metals (Ag, Cd, Cr, Cu, Fe, Hg, Mn, Ni, Pb, and Zn) in their suspended particulates, sediments, and biota. The four estuaries studied and their dominant impacting anthropogenic activity are: the St. Croix River, pulp and paper processing; the Narraguagus River, agricultural activity; the Union River, untreated town sewage; and Goose Cove (Penobscot River), mining activity. Sampling sites for each estuary were located both above and below the principal pollution injection sources. Particulate matter samples were taken at both near-surface and near-bottom stations. Animal and plant samples were collected intertidally and as many species as possible were taken at each site. Sediment cores were taken at each site using either standard piston coring or hand coring. A Jarrell-Ash 810 Atomic Absorption Spectrophotometer was used for all analyses. For both the Narraguagus and Union Rivers no significant heavy metal concentration increases were found as a result of the anthropogenic activities in their watersheds. However, increased concentrations of metals were found for the St. Croix River and Goose Cove. Overall results show that long-term compartments such as sediments and especially the fine fraction of sediments are most likely to contain elevated levels of metals while short-term compartments such as biota and suspended particulates are less likely to contain the higher levels. SOME LIMITATIONS OF WATER QUALITY MODELS FOR LARGE LAKES: A CASE STUDY OF LAKE ONTARIO,
National Water Research Inst., Burlington (Ontario).
T. J. Simons, and D. C. L. Lam.
Water Resources Research, Vol 16, No 1, p 105-116, February 1980. 7 Fig, 5 Tab, 19 Ref, 1 Append.

Descriptors: *Water quality, *Lakes, *Lake Ontario, *Model studies, Mathematical models, Nutrients, Sediments, Pollutants, Path of pollutants, Sediment transport, Phosphorus, Water pollution, Water pollution sources, Limnology, Water quality models.

Some of the problems encountered in the design of a predictive water quality model for a large lake were discussed with reference to Lake Ontario and within the framework of a simple dynamic phosphorus model which incorporates the essential mechanisms of complex plankton models. By fitting the model to a seasonal data base it was shown that equally satisfactory simulations are obtained with a variety of parameterizations and regardless of conditions of annual periodicity imposed on the solution. By comparison of model output with long-term observations it was demonstrated that seasonal verification studies of dynamic models by themselves are not sufficient to diagnose the utility of such models for predicting long-term trends. It was concluded that the uncertainty surrounding the formulation of sedimentation and nutrient regeneration, in conjunction with the sensitivity of models to assumptions regarding dynamic balance between lake concentrations and nutrient loadings, undermines the predictive capability of dynamic water quality models. DIFFUSION OF A PASSIVE SCALAR WITH RANDOM ADVECTION,
Oak Ridge National Lab., TN.
J. E. Molyneux, and A. J. Witten.
Water Resources Research, Vol 16, No 1, p 137-144, February 1980. 4 Fig, 9 Ref, 1 Append.

Descriptors: *Diffusion, *Streamflow, *Pollutants, *Path of pollutants, *Model studies, Mathematical models, Probability, Statistics, Stochastic processes, Mass transfer, Streams, Rivers, Flow, Mixing, Water pollution.

To investigate the instantaneous release of a passive additive into a flow, it was assumed that the concentration of the additive is governed by the one-dimensional advective diffusion equation in which the advecting flow velocity is a given time-dependent stochastic process. Both the one- and two-space-time point probability distributions of the random concentration field were determined. This problem, or more elaborate variations of it, is a rather idealized model for a variety of environmentally important flow situations, for example, the accidental or planned release of a contaminant into a river by a power station, and, as such, it has been investigated by a number of authors. Previous treatments, however, have concentrated on deriving information about the statistical moments of the concentration. Although such information is important, it may be inadequate for accessing the true effects of a flow additive on the environment. This investigation demonstrated the possibility of obtaining a more complete statistical description. (Sims-ISWS)

COASTAL WATER POLLUTION AROUND TIBER RIVER MOUTH--A CASE STUDY,
Consiglio Nazionale delle Ricerche, Rome (Italy). Inst. for Water Research.
T. La Noce, R. Pagnotta, M. Pettine, and A. Puddu.
Progress in Water Technology, Vol 12, No 1, p 193-209, 1980. 5 Fig, 3 Tab, 26 Ref.

Descriptors: *Water pollution, *Coasts, *Rivers, *Water pollution sources, Pollutants, Pollutant identification, On-site investigations, Sampling, Heavy metals, Toxins, Eutrophication, Nutrients, Salinity, Temperature, Dissolved oxygen, Chemical oxygen demand, Biochemical oxygen demand, Benthos, Benthic fauna, *Italy, *Tiber River(Italy).

The need to evaluate the impact of the Tiber River on the receiving marine ecosystem, and the extent of pollution abatement required to safeguard the various coastal water uses, promoted an interdisciplinary experimental investigation. First stage results of the investigation carried out off the river mouth were presented. The extension of the area influenced by the river has been estimated at 400 sq km. Due to the river's high nutrient input rates, eutrophic processes occur with an intensity depending on sample distances from the mouth. Some data concerning the limiting factor were also derived. Toxicity studies revealed an incipient threat from Cd and Hg concentration. HCB was only occasionally found in the zone; PCB's were found in surprisingly high levels further away from the river mouth. Bacteriological data led to the conclusion that the river's impact on beach bathing conditions is only limited to an area immediately adjacent to the two outfalls. With the exception of minor changes due to the eurhyaline nature of the zone, no major variation in receiving area ecology was detected (for benthos and nekton). (Sims-ISWS)

THE DETERMINATION OF EDDY DIFFUSION COEFFICIENTS USING NATURAL TRACERS,
Watson (Dagh) S.p.A, Milano (Italy).
A. Denegri, and F. Martini.
Progress in Water Technology, Vol 12, No 1, p 339-344, 1980.

Descriptors: *Dispersion, *Diffusion, *Sewage, *Outfall sewers, Model studies, Mathematical models, Tracers, Salinity, Pollutants, Path of pollutants, Water pollution, Water pollution sources, Coasts, Equations, Mathematics, *Sicily, *Messina(Sicily), *Straits of Messina.

The paper described the development of equations for the calculation of coefficients of eddy diffusion using salinity as a tracer. The results were reported of experimental work carried out in the Straits of Messina to calculate the dispersion of sewage from two proposed outfalls from the City of Messina. The authors concluded that the use of salinity as a tracer has significant advantages over the use of an artificial tracer. In particular this is because the system concerned very closely approximates to the steady state it is assumed to be, unlike that which develops using artificial tracers. Furthermore, the instrumentation involved is simple and of low cost, and the extent of the survey area is much reduced. In the areas studied the variation in salinity was sufficient to enable satisfactory calculation of the diffusion coefficients. (Sims-ISWS)

A ONE-DIMENSIONAL, STEADY-STATE, DISSOLVED-OXYGEN MODEL AND WASTE-LOAD ASSIMILATION STUDY FOR SILVER CREEK, CLARK AND FLOYD COUNTIES, INDIANA,
Geological Survey, Indianapolis, IN. Water Resources Div.
W. G. Wilber, C. G. Crawford, and J. G. Peters.
Available from: OFSS Box 25425, Fed. Ctr. Denver, CO 80225, Paper copy $8.50, Microfiche $3.50. Geological Survey open-file report 79-1253, July 1979. 60 p, 22 Fig, 10 Tab, 47 Ref.

Descriptors: *Model studies, *Dissolved oxygen, *Waste assimilative capacity, *Water quality, *Indiana, Streams, Streamflow, Low flows, Reaeration, Effluents, Forecasting, Water quality standards, Water pollution, Waste water disposal, Waste water treatment, Biochemical oxygen demand, Nitrification, Ammonia, Nitrates, Nutrients, Mathematical models, *Clark County(Ind), *Floyd County(Ind), *Silver Creek(Ind).

The Indiana State Board of Health is developing a State water-quality management plan that includes establishing limits for wastewater effluents discharged into Indiana streams. A digital model calibrated to conditions in Silver Creek was used to develop alternatives for future waste loadings that would be compatible with Indiana stream water-quality standards defined for two critical hydrologic conditions, summer and winter low flows. Effluents from the Sellersburg and Clarksville-North wastewater-treatment facilities are the only point-source waste loads that significantly affect the water quality in the modeled segment of Silver Creek. Model simulations indicate that nitrification is the most significant factor affecting the dissolved-oxygen concentration in Silver Creek during summer and winter low flows. Natural streamflow in Silver Creek during the summer and

annual 7-day, 10-year low flow is zero, so no benefit from dilution is provided. Present ammonia-nitrogen and dissolved-oxygen concentrations of effluent from the Sellersburg and Clarksville-North wastewater-treatment facilities will violate current Indiana water-quality standards for ammonia toxicity and dissolved oxygen during summer and winter low flows. The current biochemical-oxygen demand limits for the Sellersburg and Clarksville-North wastewater-treatment facilities are not sufficient to maintain an average dissolved-oxygen concentration of at least 5 milligrams per liter, the State's water-quality standard for streams. Calculations of the stream's assimilative capacity indicate that Silver Creek cannot assimilate additional waste loadings and meet current Indiana water-quality standards. (Kosco-USGS)

ARSENIC, NITRATE, IRON, AND HARDNESS IN GROUND WATER, CHENA RIDGE VICINITY, FAIRBANKS AREA, ALASKA,
Geological Survey, Fairbanks, AK. Water Resources Div.
A. P. Krumhardt.
Available from: OFSS Box 25425, Fed. Ctr. Denver, CO., paper copy $3.50, microfiche $1.00. Geological Survey open-file report 80-49, 1979. 1 Sheet, 9 Ref.

Descriptors: *Water quality, *Groundwater, *Water wells, *Iron, *Hardness(Water), Water analysis, Chemical analysis, Water pollution, Public health, Maps, Alaska, *Fairbanks(Alaska).

The report presents all data on hardness, iron, nitrate and arsenic in well water in the Chena Ridge area of Fairbanks, Alaska, through June 1979. Concentrations range as follows: arsenic - 0 to 28 micrograms per liter; nitrate - 0 to 20 milligrams per liter; iron - 0 to 18 milligrams per liter and hardness - 72 to 1,400 milligrams per liter. Values at the upper ends of the ranges for iron and nitrate exceed limits recommended by the Environmental Protection Agency for public water supplies. A map of the area showing the location of sampled wells and a table of chemical analysis are included. (Kosco-USGS)

THE USE OF THE WATER BUDGET IN EVALUATING LEACHING THROUGH SOLID WASTE LANDFILLS,
Delaware Univ., Newark. Dept. of Geography.
J. R. Mather, and P. A. Rodriguez.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180888, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Center, University of Delaware Report, October 1978, 39 p, 3 Fig, 4 Tab, 10 Ref, 3 Append. OWRT A-040-DEL(3), 14-34-0001-9008.

Descriptors: *Hydrologic budget, *Landfills, *Leaching, *Solid wastes, Subsurface drainage, Pollutants, Groundwater movement, Path of pollutants, Model studies, Evaluation.

Determination of the volume of leaching through solid waste landfills is a problem of concern to landfill operators everywhere since such leaching may carry pollutants into the local groundwater. The use of a simple yet practical climatic water budget model to calculate possible leaching volume under different landfill conditions is explained and illustrated. The water budget model only requires information on air temperature and precipitation as input. All necessary tables and formulas for evaluating the water budget model are included.
W80-04875

POLLUTION IN THE GREAT LAKES BASIN FROM LAND USE ACTIVITIES.
International Joint Commission-United States and Canada. Great Lakes Regional Office.
Report to the Governments of the United States and Canada, March 1980. 155 p, 5 Fig, 8 Tab, 5 Append.

Descriptors: *Great Lakes, *Water quality, *Water pollution sources, *Land use, Agricultural runoff, Industrial wastes, Lake Erie, Lake Huron, Lake Michigan, Lake Ontario, Lake Superior, Pesticides, Phosphorus, Eutrophication, Sediments, Silting.

In response to a request from the Governments of Canada and the United States, the International Joint Commission conducted an extensive study of the Great Lakes ecosystem and concluded that the Great Lakes are being polluted from land drainage sources. Areas of intensive agricultural and urban use contribute most heavily to this problem by producing pollutants such as phosphorus, sediments, industrial organic compounds, pesticides, and heavy metals. It is estimated that one third to one half of total phosphorus loads in the lakes are attributable to land use activities. The major source of nonpoints loads was cropland especially in highly erodable areas. Approximately 400 organic compounds were identified in the Great Lakes ecosystem including residual levels of DDT, aldrin-dieldrin and chlordane. Other sources of pollution include the atmosphere, siltation, and the disposal of liquid and solid wastes from industry. It is recommended that a comprehensive, basin-wide long-term management strategy, the 'Ecosystem Approach,' be developed to deal with these pollution problems. The areas having the worse water quality problems, Lakes Erie and Ontario, Saginaw Bay, and southern Lake Huron, should be given highest priority for remedial actions. When site-specific measures are needed, the cost-effectiveness of all remedies should be considered. Other areas of concern for remedial action include funding, legislation, coordination levels, and voluntary programs. Some specific remedial programs are recommended. (Seigler-IPA)
W80-04879

STUDIES ON TOXICITIES OF BIPHENYL ETHER HERBICIDES AND THEIR ANALOGUES TO FISH--1. THE METHEMOGLOBIN-FORMATION BY THE NITROSO-DERIVATIVES IN WHITE-SPOTTED CHAR, SALVELINUS LEUCOMAENIS, ERYTHROCYTES,
Hokkaido Univ., Hakodate (Japan). Lab. of Food Hygiene.
M. Miyauchi, M. Takagi, and T. Uematsu.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 12, p 1563-1567, 1979. 6 Fig, 19 Ref.

Descriptors: *Pesticide toxicity, *Herbicides, *Animal metabolism, Pesticide kinetics, Chemical reactions, Chemical properties, Enzymes, Biochemistry, Fish physiology, Mode of Action, Biphenyl ether herbicides, *Char, *Salvelinus, *Erythrocytes, *Methemoglobin, *Blood chemistry, *Tissue analysis.

The methemoglobin formation by the nitroso-derivatives of biphenyl ether herbicides (2,4-dichloro p-nitrobiphenyl ether and 2,4,6-trichloro p-nitrobephenyl ether) and their analogues was investigated in suspensions of white-spotted char erythrocytes. All of the nitroso-derivatives used, induced the methemoglobin formation among the nitroso-derivatives was the most potent in nitrosobenzene followed by p-nitrosobiphenyl ether, 4-chloro p-nitrosobiphenyl ether, 2,4-dichloro p-nitrosobiphenyl ether and then 2,4,6-trichloro p-nitrosobiphenyl ether in erythrocytes of both species. This order among the nitroso-derivatives was dependent on the number of chlorine rather than on its position of substitution in the phenoxy group. The mechanism of methemoglobin formation by the nitroso-derivatives was similar in erythrocytes of both species and on the requirement of NADPH-dependent enzyme systems, and that of methemoglobin reduction was similar, too, on reception of NADH-dependent enzymatic process. (See also W80-04890) (Deal-EIS)
W80-04889

STUDIES ON TOXICITIES OF BIPHENYL ETHER HERBICIDES AND THEIR ANALOGUES TO FISH--II. PRODUCTION OF METHEMOGLOBIN-FORMING METABOLITES OF THE AMINO-DERIVATIVES BY WHITE-SPOTTED CHAR, SALVELINUS LEUCOMAENIS, LIVER HOMOGENATE,
Hokkaido Univ., Hakodate (Japan). Lab. of Food Hygiene.
M. Miyauchi, M. Takagi, and T. Uematsu.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 12, p 1569-1573, 1979. 5 Fig, 21 Ref.

Descriptors: *Herbicides, *Pesticide toxicity, *Animal metabolism, Fish physiology, Pesticide kinetics, Biochemistry, Path of pollutants, Chemical reactions, Chemical properties, Enzymes, Biphenyl ether herbicides, *Char, *Salvelinus, *Tissue analysis, *Biotransformation, *Erythrocytes, *Methemoglobin, *Blood chemistry, 2,4-dichloro p-nitrobiphenyl ether, 2,4,6-trichloro p-nitrobiphenyl ether.

The activities of liver homogenates from white-spotted char and rat, to metabolize the amino-derivatives of biphenyl ether herbicides (2,4-dichloro p-nitrobiphenyl ether and 2,4,6-trichloro p-nitrobiphenyl ether) and their analogues to methemoglobin-forming metabolites were compared by incubating liver homogenates with the amino-derivatives, a NADPH-generating system and white-spotted char, rat or human erythrocytes. The results indicated that white-spotted char liver homogenates had the ability to metabolize p-aminobiphenyl ether to methemoglobin-forming metabolites although the activity was very low; while rat liver homogenates had the ability to metabolize all the amino-derivatives to methemoglobin-forming metabolites and the rates of methemoglobin formation among the amino-derivatives were the highest in p-aminobiphenyl ether followed by 4-chloro p-aminobiphenyl ether, 2,4-dichloro p-aminobiphenyl ether and then 2,4,6-trichloro p-aminobiphenyl ether. The sensitivity of erythrocytes to the methemoglobin-forming metabolites were the highest in human followed by rat and then white-spotted char erythrocytes. (See also W80-04889) (Deal-EIS)

CADMIUM, ZINC AND COPPER ACCUMULATION IN LIMPETS (PATELLA VULGATA) FROM THE BRISTOL CHANNEL WITH SPECIAL REFERENCE TO METALLOTHIONEINS,
Liege Univ. (Belgium). Lab. d'Oceanography.
F. Noel-Lambot, J. M. Bouquegneau, F. Frankenne, and A. Disteche.
Marine Ecology--Progress Series, Vol 2, p 81-89, 1980. 8 Fig, 4 Tab, 45 Ref.

Descriptors: *Cadmium, *Absorption, *Invertebrates, Zinc, Copper, Animal metabolism, Animal physiology, Heavy metals, Mode of Action, Path of pollutants, Mollusks, Bristol Channel, England, *Metallothioneins, *Limpets, *Patella, *Bioaccumulation, *Tissue analysis.

The study of metal concentrations in Patella vulgata caught from a polluted environment reveals a direct relationship between Cd concentration and body size and an inverse relationship in regard to Zn and Cu. Most of the Cd present in limpets with heavy Cd loads is bound to thioneins, but this is not the case for Zn and Cu. In young limpets, Cd-thioneins were not detected. All results indicate that during long-term Cd intoxication under field conditions, Cd deposition and increase in metallothioneins in limpets were directly linked. The induced production of metallothioneins may thus be considered as the main mechanism responsible for the cumulative absorption of Cd in limpets living in the Bristol Channel. Isolation and characterization of limpet metallothioneins were performed. They indicate that mollusc metallothioneins are very similar to those from vertebrates. (Deal-EIS)

RELATIONSHIP BETWEEN THE BODY SIZE OF PRINCIPAL SHELLFISH AND THE CONCENTRATION OF FEW HEAVY METALS (IN JAPANESE),
Iwate Prefectural Office (Japan). Forestry and Fishery Div.
S. Kamimura.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 46, No 1, p 79-82, 1980. 4 Fig, 2 Ref. (English summary).

Descriptors: *Heavy metals, *Absorption, *Commercial shellfish, Bioindicators, Mathematical models, Oysters, Path of pollutants, Animal metabolism, Animal physiology, Weight, Mercury, Copper, Zinc, Cadmium, *Scallops, *Abalones, *Bioaccumulation, *Tissue analysis.

It is important to clarify the concentration of heavy metals in aquatic organisms under normal conditions in order to evaluate heavy metal pollution. For this purpose the normal levels of a few heavy metals in the cultured scallops, oysters and abalones were determined from the relationship between the body weight and the concentration of heavy metals. The results obtained showed that the concentration of each heavy metal in the soft parts increased with the increase of body weight. The relationship was especially significant in the mid-gut gland including stomach of scallops. These results suggest the existence of a characteristic pattern of heavy metal accumulation for each species. The pattern observed in the mid-gut gland of scallops together with that in the soft parts may be available as a biological index for the evaluation of heavy metal pollution in environmental sea water. (Deal-EIS)
W80-04894

CONCENTRATION AND DISTRIBUTION OF URANIUM IN MYTILUS EDULIS AND ASSOCIATED MATERIALS,
Institute for Marine Environmental Research, Plymouth (England).
E. I. Hamilton.
Marine Ecology--Progress Series, Vol 2, p 61-73, 1980. 6 Fig, 8 Tab, 24 Ref.

Descriptors: *Uranium radioisotopes, *Mussels, *Absorption, Path of pollutants, Radioactive wastes, Radioecology, Animal metabolism, Radiochemical analysis, Biochemistry, Seasonal, Bottom sediments, *Tissue analysis, *Bioaccumulation, *Mytilus, *Depuration, *Transuranic elements.

Concentration and distribution of uranium in the mussel Mytilus edulis are described for sampling sites in the United Kingdom near and distant from sources of nuclear effluents; the data reflect natural availability from the marine environment, any effect attributable to the proximity of nuclear effluent discharges being minimal. With the exception of uranium associated with food and particulate materials present in the digestive organ, the highest levels were found associated with byssal threads, the periostracum and the excretory organs. It has been observed that the tanning process associated with the development of byssal threads involves uranium which has a special affinity for SS-SH and disulphide groups in organs. The lowest concentrations of uranium were found in the periostracum-free shell. Depuration experiments have demonstrated that after a fairly rapid loss of uranium from the digestive gland, that which remains within organs and tissues is retained and is associated with the surfaces of organs and tissues. In the sediments uranium is enriched in the finer fraction but no evidence for an excessive enrichment arising from nuclear effluents was observed. (Deal-EIS)

ACCUMULATION AND BIOLOGICAL EFFECTS OF CADMIUM IN RAINBOW TROUT,
Tokai Regional Fisheries Research Lab, Yokosuka (Japan). Arasaki Marine Biological Station.
H. Kumada, S. Kimura, and M. Yokote.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 46, No 1, p 97-103, 1980. 2 Fig, 6 Tab, 25 Ref.

Descriptors: *Cadmium, *Absorption, *Rainbow trout, Heavy metals, Fry, Mode of Action, Path of pollutants, Water chemistry, Fish physiology, Bioassay, Growth rates, Mortality, *Bioaccumulation, *Tissue analysis.

The biological effects and accumulation of cadmium stearate, acetate, and chloride in rainbow trout fingerlings were investigated. No adverse effect was observed on survival, growth and histology of the fish exposed to cadmium compounds via water at a concentration of 4 microg Cd/l for 10 weeks, and also the fish exposed to the same compounds via food at a concentration of 10 mgCd/kg for 12 weeks. However, the fish orally exposed to cadmium stearate of 100 mgCd/kg showed histological changes of a slight degree in their livers and kidneys. Total cadmium loads (microg Cd/fish) decreased prominently in the fish orally exposed to the chemicals 10 weeks after discontinuation of exposure, while those in the fish exposed via ambient water almost remained unchanged during this time. From the results of the present study, it is postulated that the route of cadmium absorption via water chiefly participates in the accumulation of the metal in fishes under natural conditions. (Deal-EIS)

INFLUENCE OF COPPER AND ZINC IN FOOD SUBSTANCE ON THE ACCUMULATION OF CULTURED OYSTERS (IN JAPANESE),
Iwate Prefectural Office (Japan). Forestry and Fishery Div.
S. Kamimura.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 46, No 1, p 83-85, 1980. 1 Fig, 3 Tab, 7 Ref, (English abstract).

Descriptors: *Oysters, *Copper, *Zinc, *Absorption, Aquiculture, Growth rates, Commercial shellfish, Path of pollutants, Heavy metals, Chemical analysis, Water chemistry, Diatoms, *Bioaccumulation, *Tissue analysis.

Living feeds collected at each hanging depth of oyster clumps in sea water of an oyster farm were analyzed for the determination of copper and zinc. The concentration of copper and zinc in oysters cultured at Miyako Bay showed a tendency to decrease according to the hanging depth of oyster clumps, while that in the sea water inversely. The same tendency was also observed in the weight of soft parts of oysters. These results suggest that the growth pattern of cultured oysters, together with the heavy metal accumulation in food substances for oysters, is the principle factor in the characteristics of heavy metal accumulation at each oyster hanging depth. MELIMEX, AN EXPERIMENTAL HEAVY METAL POLLUTION STUDY: CHEMICAL SPECIATION AND BIOLOGICAL AVAILABILITY OF COPPER IN LAKE WATER,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
P. Baccini, and U. Suter.
Schweizerische Zeitschrift fur Hydrologie, Vol 41, No 2, p 291-314, 1979. 13 Fig, 6 Tab, 26 Ref.

Descriptors: *Copper, *Lakes, *Chemical reactions, Chemical properties, Water chemistry, Sorption, Biomass, Plankton, Hydrogen ion concentration, Heavy metals, Chemical analysis, Seasonal, Copper compounds, *Bioavailability, *Ligands.

The chemical speciation of dissolved copper was investigated in waters from the limno-corrals of the MELIMEX project and compared with speciation data from other Swiss lakes. Copper is complexed primarily by organic ligands having molecular sizes between 10000 and 1000 daltons. The mean concentration of the ligands is approximately 5 x 10 to the minus 7th power mole/mg DOC. The conditional stability constants (pH = 8.8) are about 10 to the 11th power. An increased metal load did not induce an increase of binding ligands. A comparison of calculated Cu2+ concentration with corresponding copper contents in the biomass leads to the conclusion that organic ligands and pH are the most important factors in deciding the biological availability of copper. However, the sorption capacity of the biomass depends as well on the variety of plankton species. (Deal-EIS)
W80-04899

MELIMEX, AN EXPERIMENTAL HEAVY METAL POLLUTION STUDY: BEHAVIOUR OF HEAVY METALS IN AN AQUATIC FOOD CHAIN,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
R. Gachter, and W. Geiger.
Schweizerische Zeitschrift fur Hydrologie, Vol 41, No 2, p 277-290, 1979. 3 Fig, 5 Tab, 30 Ref.

Descriptors: *Food chains, *Heavy metals, *Plankton, Phytoplankton, Zooplankton, Periphyton, Diptera, Lake Trout, Fry, Mercury, Copper, Cadmium, Zinc, Lead, Path of pollutants, Trophic level, Absorption, Sorption, Metabolism, Aquatic insects, *Bioaccumulation, *Tissue analysis.

Phytoplankton, periphyton and zooplankton samples, chironomid and Sialis sp. larvae, and fry of trout and bream collected from unpolluted and artificially metal-polluted limno-corrals were analyzed for mercury, copper, cadmium, zinc and lead. On a dry weight basis, metal concentrations were highest in phytoplankton and periphyton samples, lower in zooplankton, chironomidae and Sialis and lowest in fish, indicating that inorganic Hg, Cu, Cd, Zn and Pb are not accumulated through the food chain and do not reach highest concentrations in highest trophic levels. The results further suggest that increased metal concentrations in the environment favor phytoplankton organisms with a lower metal sorption capacity. This negative feedback mechanism may play an important ecological role by reducing the metal content in organisms at lower trophic level, thereby reducing the danger of adversely affecting the organisms of higher trophic levels which feed upon them. (Deal-EIS)
W80-04900

MELIMEX, AN EXPERIMENTAL HEAVY METAL POLLUTION STUDY: EFFECTS OF INCREASED HEAVY METAL LOAD ON UPTAKE OF GLUCOSE BY NATURAL PLANCTONIC COMMUNITIES,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
P. Bossard, and R. Gachter.
Schweizerische Zeitschrift fur Hydrologie, Vol 41, No 2, p 261-270, 1979. 3 Fig, 3 Tab, 19 Ref.

Descriptors: *Heavy metals, *Inhibition, *Plankton, *Metabolism, Copper, Zinc, Cadmium, Lead, Mercury, Lakes, Seasonal, Water quality standards, Absorption, Carbon radioisotopes, Tracers, Natural selection, *Glucose.

Glucose uptake in lake water samples has been determined with short-time 14C-experiments at different additions of the single heavy metals Cu, Zn, Cd, Pb, Hg and at different additions of a combination of all metals. The degree of metal-induced inhibition of glucose uptake varied from lake to lake and from season to season. The addition of legally tolerated concentrations of 10 microg Cu/l and 200 microg Zn/l inhibited glucose uptake in most samples significantly, as well as the simultaneous addition of all metals. The legally tolerated limit of 1 microg Hg/l inhibited glucose uptake in Lake Lucerne samples almost completely, but showed no effect in samples of Lake Baldegg. The equimolar toxicity sequence of heavy metals for heterotrophic microorganisms has been determined as: Hg>Cu>Cd>(Zn, Pb). Glucose uptake of plankton sampled from metal polluted limno-corrals was less inhibited than that of the control plankton, when heavy metals were added to the samples singly or in combination. It is assumed that this effect is due to the natural selection of more resistant plankton species. (Deal-EIS)
W80-04901

MELIMEX, AN EXPERIMENTAL HEAVY METAL POLLUTION STUDY: OLIGOCHAETES AND CHIRONOMID LARVAE IN HEAVY METAL LOADED AND CONTROL LIMNO-CORRALS,
Conservation de la faune, Lausanne (Switzerland).
C. Lang, and B. Lang-Dobler.
Schweizerische Zeitschrift fur Hydrologie, Vol 41, No 2, p 271-276, 1979. 1 Fig, 2 Tab, 14 Ref.

Descriptors: *Tubificids, *Diptera, *Toxicity, *Heavy metals, Dissolved oxygen, Water chemistry, Sediment-water interfaces, Benthic fauna, Primary productivity, Animal populations, Growth rates, Reproduction, Inhibition.

In two limno-corrals loaded with heavy metals the density of tubificid worms and chironomid larvae was higher than in the control. The better oxygen conditions observed in the heavy metal loaded corrals might explain this discrepancy. The higher oxygen concentration at the sediment-water interface was due to lower organic sedimentation, a consequence of the primary production reduced by heavy metals. In all limno-corrals, the tubificid populations consisted of Tubifex tubifex. The size structure of tubificid populations in the heavy metal loaded corrals indicated a delayed reproduction compared to the control. (Deal-EIS)

OFFSHORE SITING OF NUCLEAR POWER PLANTS,
Illinois Univ. at Urbana-Champaign.
J. W. Kindt.
Ocean Development and International Law Journal, Vol 8, No 1, p 57-103, 1980.

Descriptors: *Energy, *Nuclear powerplants, *Offshore platforms, *Water pollution sources, *Resources development, Jurisdiction, Legislation, International law, Environmental effects, Baseline studies, Floating, *Outer Continental Shelf, *Energy sources, Environmental impact, Law of the Sea, Site selection, *Floating Nuclear Plants(FNPs).

Of the newly suggested energy sources, nuclear power has the most immediate potential for solving predicted energy shortages in the U.S. during the next two decades. Nuclear power plants require approximately 500 acres of ground and a million gallons of cooling water per minute, but there are few remaining land sites in the U.S. which meet these requirements. One solution is to build floating nuclear plants (FNPs) and site them in the ecologically sensitive oceans. The environmental impacts of constructing and operating FNPs appear to be large; however, the domestic legislation of the U.S. can adequately regulate the problems associated with thermal discharge, perimeter contamination, and the risk of major accidents. On the international level, the U.S. needs to recognize the environmental and jurisdictional issues involving FNPs and then avoid potential FNP problems in the current law of the sea negotiations. DEEP WELL INJECTION FOR FLORIDA EFFLUENT.
World Water, Vol 3, No 1, p 22-23, January, 1980.

Descriptors: *Injection wells, *Waste disposal wells, *Sewage disposal, *Florida, Deep wells, Confined aquifers, Saline waters, Sewage effluent.

Deep well injection of sewage effluent is a viable alternative to deep-sea disposal for the Miami, Florida area if there are adequate safeguards to protect the Biscayne aquifer. The Floridan aquifer, even though saline with chloride counts ranging from 600 mg/l to 800 mg/l, also requires protection since it would be a potential source of drinking water if it were desalinated. The injection zone, a highly saline and permeable cavernous dolomite, is separated from the Floridan aquifer by 1000 feet of impermeable, dense carbonates. The effluent ultimately migrates to the Straits of Florida. When completed each of eight 24-inch injection wells will handle 10,000 gpm of effluent treated to 95% removal. It is claimed that deep-well disposal represents 10% of the operating cost and 1% of the maintenance cost for conventional tertiary treatment and deep-sea outfall facilities without the risk of beach pollution. HIGH FREQUENCY TEMPERATURE FLUCTUATIONS IN A POWER-PLANT THERMAL PLUME,
Wisconsin Univ.-Madison. Dept. of Civil and Environmental Engineering.
T. Green, and S. Roffler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-184062, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Center, University of Wisconsin Technical Completion Report WIS WRC 80-06, 1980. 59 p, 22 Fig, 1 Tab, 25 Ref, Append. OWRT B-089-WIS(1), 14-31-0001-4141.

Descriptors: *Thermal powerplants, Powerplants, Water temperature, *Thermal pollution, Water cooling, Heated water, Thermocline, *Point Beach(Wis), Instrumentation, *Water temperature fluctuations, Wisconsin, *Lake Michigan, *Thermal plume, Aerial photography, Infrared radiation, Sampling, Measurement, Laboratory tests, Path of pollutants.

High-frequency temperature variations were measured at seven depths, from the water surface to three meters, at a point 130 meters from the cooling-water outfall of a power plant on Lake Michigan. The data are analyzed using spectra, correlation functions, and probability distributions. The sharp thermal fronts observed in the data are related to the surface thermal fronts seen using airborne infrared scanning, and to laboratory studies of instabilities in mixing layers between uniformly flowing and quiescent fluids.

AGRICULTURAL LAND USE: EFFECTS ON THE CHEMICAL QUALITY OF RUNOFF,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agricultural Engineering.
M. D. Smolen, and V. O. Shanholtz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-183163, Price codes: A05 in paper copy, A01 in microfiche. Virginia Water Resources Research Center, Virginia Polytechnic Institute and State University. Bulletin 125, April 1980. 82 p, 24 Fig, 12 Tab, 18 Ref, Append. OWRT A-058-VA(3).

Descriptors: *Agriculture, *Agricultural runoff, Effects, *Water quality, *Nitrogen, *Phosphorus, Agricultural watersheds, Streamflow, Monitoring, Water analysis, Chemical analysis, Path of pollutants, Baseline studies, Uncultivated watershed, Rainwater quality, *Background water quality.

This research focused on changes in runoff quality when land is put under cultivation. The data will be used in later phases of research to evaluate chemical transport models. The 3 study watersheds, located in Virginia's southern Piedmont, had not been under cultivation for 30 years. During the research, 2 of the watersheds were put into agricultural production while the third was left uncultivated and used as a control. A grab sampling program was maintained on 2 watersheds for the full 5-year study period. Continuous streamflow gaging was maintained for the last 4 years. During the final 3 years, sampling and flow gaging were also maintained on a third watershed. Samples were analyzed for nitrate, ammonium, and total Kjeldahl nitrogen, orthophosphate and total phosphorus, bicarbonate alkalinity, pH, and specific conductance. Clear differences in streamflow characteristics were noted between the treated and the control watersheds. More surface runoff was observed in the treated watersheds than in the control, suggesting that increased surface runoff may have resulted from the cropping activity. All 3 watersheds exceeded the phosphorus criterion proposed by EPA, and a two-to-threefold increase in total phosphorus concentration was attributed to agricultural land use without employment of conservation practices. A twofold increase in total nitrogen concentration also was noted. Soluble inorganic nitrogen was present at a low concentration in the control watershed, but accounted for 20-30 percent of all nitrate nitrogen exported from the treated watersheds. The presence of nitrate nitrogen in the agricultural watersheds was the characteristic most attributable to agricultural activity.

POPULATION DYNAMICS AND TROPHIC RELATIONSHIPS OF MARINE BIRDS IN THE GULF OF ALASKA,
Fish and Wildlife Service, Anchorage, AK. Office of Biological Services and Coastal Ecosystems.
C. J. Lensink, P. J. Gould, and G. A. Sanger.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol II, Receptors--Birds, p 7-20, October 1979. 22 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Birds, *Trophic levels, *Biology, *Habitats, Resources development, Water pollution sources, Environmental effects, Baseline studies, Alaska, *Outer Continental Shelf, Gulf of Alaska, Population dynamics, Petroleum development.

During 1978, studies of the breeding biology of seabirds were conducted at three locations in the Gulf of Alaska (Middleton Island, Sitkalidak Strait, and Chiniak Bay), and one location in Cook Inlet (Chisik Island). Studies on the trophic relationships of seabirds were conducted in the Kodiak area, primarily in Izhut and Kiliuda Bays, during the summer of 1978, and in Kachemak Bay during the winter of 1977-1978. The feeding habits of birds directly pertinent to breeding biology were studied at Sitkalidak, Chisik and Middleton. The selection of study sites was based on several factors, including their location in relation to OCS lease areas, the diversity of habitats, the species of seabirds present, the information available for each site, and the accessibility of each site. (Sinha-OEIS)

THE BREEDING BIOLOGY OF MARINE BIRDS ASSOCIATED WITH CHINIAK BAY, KODIAK ISLAND, 1975-1978,
Fish and Wildlife Service, Anchorage, AK. Office of Biological Services and Coastal Ecosystems.
D. R. Nysewander, and D. B. Barbour.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol II, Receptors--Birds, p 21-106, October 1979. 27 Fig, 19 Tab, 19 Ref, 3 Append, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-01-5-022-3538.

Descriptors: *Birds, *Breeding, *Ecology, Baseline studies, Environmental effects, Water pollution, Waterfowl, Alaska, Resources development, *Outer Continental Shelf, Petroleum development, Trophic relationships, Kodiak(AK).

Intensive studies of the breeding biology of marine birds were conducted at Chiniak Bay, Kodiak Island, in 1978 for the second consecutive year. The rate and annual variation of reproductive success was evaluated for black-legged kittiwake (Rissa tridactyla), tufted puffin (Lunda cirrhata), glaucous-winged gull (Larus glaucescens), mew

gull (Larus canus), pelagic cormorant (Phalacrocorax pelagicus), and red-faced cormorant (Phalacrocorax urile). Breeding phenologies were essentially the same in 1977 and 1978 for all species except pelagic cormorants. Productivity decreased in 1978 for all the major study species except tufted puffin. (Sinha-OEIS)

BREEDING BIOLOGY AND FEEDING HABITS OF SEABIRDS OF SITKALIDAK STRAIT,
Fish and Wildlife Service, Anchorage, AK. Office of Biological Services and Coastal Ecosystems.
P. A. Baird, and M. A. Hatch.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol II, Receptors--Birds, p 107-186, October 1979. 28 Fig, 21 Tab, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder. Colorado. NOAA-01-5-022-2538.

Descriptors: *Birds, *Breeding, *Food habits, Environmental effects, Baseline studies, Resources development, Water pollution effects, Alaska, Oil spills, Drilling, Leases, *Outer Continental Shelf, Petroleum development, Gulf of Alaska, Sitkalidak Strait.

The purpose of the OCSEAP studies was to define the role of seabirds in the Alaskan marine environment and to identify and evaluate potential impacts to the seabirds from the development of the petroleum reserves on the Alaska Outer Continental Shelf. Sitkalidak Strait with its important colonies on Cathedral Island and the adjacent Boulder Bay was identified as a key site to study. Reproductive success of seabirds is not constant from year to year but varies perhaps in accordance with fluctuations in the ecosystem. It is believed that one of the variables in the ecosystem which may influence reproductive success is food availability. Tufted puffins and arctic and Aleutian terns seemed to be most sensitive to human disturbance. Disturbance of the habitat for Arctic and Aleutian terns combined with egging produced very little reproductive output in the colony where this disturbance occurred. Presence of humans and their pets and any major habitat disturbance or destruction at the time before egg laying, and during the egg and chick stages tend to be detrimental to the productivity of the seabirds. (Sinha-OEIS)

REPRODUCTIVE ECOLOGY OF SEABIRDS AT MIDDLETON ISLAND, ALASKA,
Fish and Wildlife Service, Anchorage, AK. Office of Biological Services and Coastal Ecosystems.
S. A. Hatch, T. W. Pearson, and P. J. Gould.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol II, Receptors--Birds, p 233-308, October 1979. 24 Fig, 15 Tab, 23 Ref, Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program. Boulder, Colorado. NOAA-01-5-022-2538.

Descriptors: *Birds, *Breeding, *Food habits, *Ecology, Baseline studies, Environmental effects, Water pollution, Resources development, Oil pollution, Reproduction, Alaska, *Outer Continental Shelf, Gulf of Alaska, Petroleum development, Middleton Island.

Studies of population, breeding phenology, productivity, and food habits of seabirds were conducted on Middleton Island from 22 April to 18 August 1978. Middleton Island lies about 50 miles southeast of Montague Island and 70 miles from the Alaskan mainland. The island harbors the largest colonies of several species of seabirds in the north-central Gulf of Alaska. It is situated almost directly in the path of the main Alaska Current and directly downstream from potential oil drilling or pumping operations. For these reasons, Middleton Island is deemed to be a site of key importance for baseline environmental study in the region. Particular emphasis was placed on the breeding phenology of seven species, on the productivity of black-legged kittiwakes and pelagic cormorants, and on the foods brought to nestling kittiwakes, rhinoceros auklets and tufted puffins. On the whole, breeding phenology of seabirds at Middleton Island was extraordinarily early and protracted relative to other colonies in the Gulf of Alaska. (Sinha-OEIS)

THE WINTER FEEDING HABITS OF SELECTED SPECIES OF MARINE BIRDS IN KACHEMAK BAY, ALASKA,
Fish and Wildlife Service, Anchorage, AK. Office of Biological Ecosystems.
G. A. Sanger, R. D. Jones, Jr., and D. W. Wiswar.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol II, Receptors--Birds, p 309-347, October 1979. 9 Fig, 8 Tab, 13 Ref, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-01-5-022-2538.

Descriptors: *Birds, *Food habits, *Winter, *Ecology, Baseline studies, Water resources, Resources development, Environmental effects, Food webs, Water pollution, Alaska, *Outer Continental Shelf, Cook Inlet, Trophic relationships, Petroleum development, Kachemak Bay.

From November 1977 to April 1978, marine birds were studied on Kachemak Bay, Alaska to determine their feeding habits and trophic relationships. Kachemak Bay, located at the southwest end of the Kenai Peninsula, Alaska, is a major geographic feature of lower Cook Inlet. It has long been recognized for its high biological productivity. Studies concentrated on oldsquaw, white-winged scoters, common murres and marbled murrelets. The birds ate 74 prey species in 11 major taxonomic groups. The birds in Kachemak Bay in winter appear to be largely dependent on a food web which has a detrital base. Because changes in distribution or abundance of food may be critical to survival of birds, changes in the structure of their food web(s) caused by development of petroleum resources may have major significance. This study, be determining types and importance of prey, will improve predictions of the consequences of environmental changes from petroleum activities. (Sinha-OEIS)

POPULATION DYNAMICS AND TROPHIC RELATIONSHIPS OF MARINE BIRDS IN THE GULF OF ALASKA AND SOUTHERN BERING SEA. PART 11: NOTES ON THE WINTER SEABIRDS OF CHINIAK BAY, KODIAK ISLAND, ALASKA,
Fish and Wildlife Service, Anchorage, AK. Office of Biological Services and Coastal Ecosystems.
M. Dick.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol II, Receptors--Birds, p 492-516, October 1979. 3 Fig, 3 Tab, 11 Ref, Addendum, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Birds, *Ecology, *Seasons, *Winter, *Data collections, Oil spills, Water pollution effects, Baseline studies, Environmental effects, Hazards, Summer, Alaska, Resources development, *Outer Continental Shelf, Trophic relationships, Population dynamics, Kodiak Island.

An annotated list of seabirds observed in Chiniak Bay during the winter of 1976-77 is presented. Included are observations and records by local observers, mostly fishermen. Outer Continental Shelf (OCS) studies to date in Alaska have not adequately assessed inshore winter bird distribution, abundance and trophic relationships. It would seem that the danger of an oil disaster inshore is greater in winter than in summer. If a disaster were to occur in winter, cleanup operations would likely be more difficult, and volatile components would not evaporate as fast. The effects of a winter oil spill are less easily assessed, because the bird populations involved are mostly not local; they come from many areas. The damage would not only affect the spill area, but also breeding grounds northward, westward, and in the interior of Alaska. The effects of a winter spill, however, might not be as lasting as a summer spill which involves whole colonies of breeding birds. It is recommended that more field crews be launched for safe but intensive winter field work in certain areas such as Kokiak, perhaps coordinated with boat surveys for ground truth. (Sinha-OEIS)

NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Organic matter, *Sediments, *Baseline studies, *Monitoring, *Path of pollutants, Oil pollution, Resources development, Water pollution effects, Environmental effects, Alaska, *Outer Continental Shelf, Gulf of Alaska, Bering Sea, Beaufort Sea, Norton Sound, Hydrocarbons, Biogenic hydrocarbons, Anthropogenic hydrocarbons.

Sediments were collected from the proposed lease areas of Beaufort Sea, Norton Sound, Kodiak Shelf and Cook Inlet during 1976-1978 and analyzed for total carbon, organic carbon, aliphatic and aromatic hydrocarbon contents. The objectives of the investigation are: (1) to establish the baseline hydrocarbon levels of sediment samples in the area, (2) to characterize the distribution and nature of these hydrocarbons, (3) to assess the possible source of the hydrocarbons in surface sediments, whether biogenic or anthropogenic, and (4) to understand the probably pathways of hydrocarbon transport in each of the areas in case of an oil spill. The baseline studies indicate that the sediment in the study areas is generally unpolluted. The characteristics of n-alkane hydrocarbons are typical of a mixture of marine and terrestrial components; with Norton Sound sediments containing the highest and Kodiak Shelf sediments, the lowest levels of terrigenous input. The distribution of polycyclic aromatic hydrocarbons is complex and shows a pyrolysis source in all the study areas. In addition, the presence of fossil arenes is indicated in Beaufort Sea sediments. NUTRIENT INTERACTIONS AND ALGAL QUALITY IN CAYUGA LAKE,
New York State Coll. of Agriculture and Life Sciences, Ithaca. Ecology and Systematics Section.
J. P. Barlow.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180912, Price codes: A03 in paper copy, A01 in microfiche. Project Technical Completion Report to the Office of Water Research and Technology, April 1980. 33 p, 6 Fig, 3 Tab, 40 Ref. OWRT C-6054(No 5206)(1), 14-31-0001-5206.

Descriptors: Eutrophication, Algae, Diatoms, *Phosphorus, *Silicates, *Phytoplankton, *Growth rates, Lakes, New York, *Cayuga(NY).

Mixed phytoplankton from Cayuga Lake, N.Y. were subjected to perturbations of Si and P in continuous flow experiments. Diatom growth rates and cell quotas in late summer (July-August) were used to derive parameters for Droop's empirical growth equation. Using these parameters with Droop's relations it was possible to identify periods when diatom growth was controlled by P or Si, and to relate rate of growth to cell quotas during late summer. These same parameters did not, however, serve to relate observed growth rate to cell quotas at lower temperatures of experiments run in spring and early summer (May-June). It is shown that it would require as much as 2-5X changes in size of these parameters to relate growth to cell quotas at these lower temperatures, and that it would also require equivalent increases in cell quotas to maintain the same rate of nutrient controlled growth at the lower temperatures. Estimates of cell quotas of the natural lake community suggest that seasonal changes in diatom abundance is probably not controlled by Si-depletion, and that in summer diatom growth is controlled by P.

AN AVOIDANCE RESPONSE BIOASSAY FOR AQUATIC POLLUTANTS,
Kentucky Water Resources Research Inst., Lexington.
J. A. Black, and W. J. Birge.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180490, Price codes: A03 in paper copy, A01 in microfiche. Research Report No 123, 1980. 40 p, 7 Fig, 3 Tab, 38 Ref. OWRT A-077-KY(1), 14-34-0001-8019(FY-78), 14-34-0001-9019(FY-79).

Descriptors: *Heavy metals, *Avoidance response, *Behavior, *Fish, Amphibia, Water quality, *Bioassay, Pollutants, Toxicity, *Attraction, *Juvenille fish, Embryo-larval tests.

Avoidance response bioassays were conducted with eight aquatic contaminants, including cadmium, copper, mercury, zinc, chloroform, dioctylphthalate (DOP), trisodium nitrilotriacetic acid (NAT), and phenol. Tests were performed in a dual-channel fluviarium system, and the toxicant injection procedure used provided good regulation of exposure concentrations. Juvenille stages of largemouth bass (Micropterus salmodes), bluegill, sunfish (Lepomis macrochirus), and rainbow trout (Salmo gairdneri), and tadpoles of the American toad (Bufo amaricanus) proved to be suitable animals for evaluating avoidance or attraction responses. The trout was the most sensitive species tested. Avoidance was significant in tests with cadmium, phenol, and zinc, and significant attraction resulted from exposures to chloroform, DOP, and mercury. Animals generally avoided lower concentrations of copper but were attracted to higher exposure levels. NTA produced variable responses. In tests with trout, threshold concentrations for avoidance or attraction were estimated to fall at 0.0002 mg/l mercury, 0.047 mg/l zinc, 0.052 mg/l cadmium, 0.074 mg/l copper, 11.9 mg/l chloroform, and 56.6 mg/l NTA. The threshold for phenol, determined using bluegill, was 39.0 mg/l. Results from fish embryo-larval toxicity tests were used to gauge sensitivity of the avoidance response bioassay. Toxicant concentrations which produced embryo-larval lethality or teratogenesis at frequencies of 10% (LC10) and 1% (LC1) were compared. (Huffsey-Kentucky)

MICRO-ORGANIC COMPOUNDS IN THE WATER ENVIRONMENT AND THEIR IMPACT ON THE QUALITY OF POTABLE WATER SUPPLIES,
Water Research Commission, Pretoria (South Africa).
G. J. Stander.
Water S. A., Vol 6, No 1, p 1-14, January 1980. 6 Fig, 19 Tab, 25 Ref.

Descriptors: *Organoleptic properties, *Organic compounds, *Water quality, *Water pollution sources, *Potable water, Odor, Taste, Water properties, Chemical analysis, Pollutant identification, Toxicity, Water pollution effects, Water chemistry, Chlorination, Water purification.

An evaluation of the reported literature on micro-organics in water was used to develop a plan for the optimum utilization of South Africa's limited water resources. Micro-organic compounds in the water environment came from return flows from waste water treatment facilities, urban and agricultural runoff, and atmospheric precipitation. Recently developed improved analytical techniques have resulted in the identification of more than one thousand organic compounds at very low concentrations. These compounds have been classified into 22 groups that are listed with the number of compounds in each group. Frequencies of detection in drinking water and their highest concentrations are also given. Toxicity ratings are given for the approximately 60 compounds reported in drinking water by the American Waterworks Association. Despite much alarm there is very limited evidence that micro-organics in drinking water are connected to health problems. Epidemiological studies are needed to further evaluate the significance of micro-organics in water quality. Tastes and odors in drinking water caused by organic compounds in micro-concentrations especially from chlorination are discussed. Overall there is agreement that the current conventional water purification processes can effectively provide healthy safe drinking water, however, South Africa should adopt a plan of prevention rather than cure to ensure the health safety of public water supply systems. (Seigler-IPA)

HEALTH CONSIDERATIONS IN THE PREPARATION OF DRINKING WATER FROM THE RIVER RHINE,
Keuringsinstituut voor Waterleidingartikelen, Rijswijk (Netherlands).
C. L. M. Poels,.
Water S. A., Vol 6, No 1, p 15-20, January 1980. 2 Fig, 4 Tab, 9 Ref.

Descriptors: *Rhine River, *Potable water. *Rainbow trout, *Water quality, *Chromosomes, Cytological studies, Toxicity, Public health, Water pollution, Water purification, Aquatic bacteria, Organic compunds, Minnows, Fish eggs, Fish reproduction.

The toxicity of Rhine River water to rainbow trout was studied as part of an assessment of the safety of drinking water prepared from river water. Four experiments were conducted: (1) determination of the chronic toxic quality of Rhine water and its effects on rainbow trout; (2) determination of the effects of Rhine water on egg and juvenile development of rainbow trout; (3) introduction of cytogenetic effects of Rhine water in fish; and (4) introduction of mutations in bacteria by Rhine water extracts. A brief general description of experimental design is given for each experiment along with a discussion of results. From the overall results it is concluded that: (1) Rhine water is chronically toxic to rainbow trout; (2) rainbow trout are unable to complete normal life cycles in Rhine water due to high egg mortality rates; (3) chromosome breaks occur in the gills of the eastern mudminnow when exposed to Rhine water; and (4) mutations are induced in bacteria exposed to the fraction of armoatic hydrocarbons found in Rhine water. From these results it is concluded that chronic exposure to Rhine water can be harmful to water organisms. While these conclusions are based on experiments with fish, and little is known about the relationship of fish susceptibility and human susceptibility, the use of Rhine water in the preparation of drinking water should receive further careful research. STUDY OF THE BENTHIC POPULATIONS OF SOFT SUBSTRATES OFF THE OUTFALL OF THE MAIN SEWER OF MARSEILLE. 1. GENERAL DATA ON THE ENVIRONMENT AND POPULATIONS (IN FRENCH),
Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
J. C. Romano.
Tethys, Vol 9, No 2, p 113-121, 1979. 6 Fig, 10 Tab, 7 Ref. (English Summary).

Descriptors: *Sewage effluents, *Toxicity, *Aquatic populations, Benthic fauna, Outlets, Sewage disposal, Dissolved oxygen, Domestic wastes, Municipal wastes, Water chemistry, Chlorination, Dominant organisms, Marseille, Mediterranean, *Capitella, *Nereis, *Scolelepis, France.

Almost all the waste water of Marseilles discharge into the sea at the 'calanque de Cortiou'. The influence of the pollution on benthic populations of soft bottom shows the existence of concentric areas in front of the outlet of the sewage. Seven stations were studied every month for one year. In this paper, some characters of populations are described using a yearly mean for each station. Correlations are established between nature of populations and natural conditions. A microrepartition of these populations is pointed out. (Deal-EIS)

DEGREE OF DISPERSION OF THE ZACO TEMMINCKI SCHOOL TO WATER QUALITY IN A STREAMING WATER TROUGH (IN JAPANESE),
Tokyo Univ. of Fisheries (Japan).
M. Inoue, T. Arimoto, and I. Kono.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 12, p 1485-1490, 1979. 2 Fig, 7 Tab, 5 Ref, (English abstract).

Descriptors: *Fish behavior, *Toxicity, *Water pollution, Bioindicators, Detergents, Schools(Fish), Water quality, Social behavior(Animal), Analytical techniques, Water chemistry, Rheotropism, Bioassay.

In a preliminary observation on the schooling behaviour of three kinds of river fish (Zacco temmincki, Tribolodon hakonensis, and Morco steindachneri), which were composed of three fish each, it was found that the school of Z. temmincki showed the most concentrated schooling behaviour at a certain position in the water trough compared with the other two kinds of fish. Using this behaviour of Z. temmincki, the relation between the degree of dispersion of the school and the water quality was examined and the following results were obtained. The degree of dispersion of the Z. temmincki was obviously affected by the water samples taken from three stations of the Tama river and it was also found to be affected by the difference of water quality caused by the degree of synthetic detergent ABS contained. Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
J. Urech.
Schweizerische Zeitschrift fur Hydrologie, Vol 41, No 2, p 247-260, 1979. 5 Fig, 7 Tab, 31 Ref.

Descriptors: *Heavy metals, *Crustaceans, *Zooplankton, *Toxicity, Growth rates, Inhibition, Growth stages, Mercury, Copper, Cadmium, Zinc, Lead, Lakes, Mode of action, Mortality, Zooplankton fecundity.

The crustacea plankton of three artificial model lakes in Lake Baldegg was observed during 15 months. Two were loaded continuously with low concentrations of five heavy metals (Hg, Cu, Cd, Zn, Pb). We attempted to explain the significant lower abundances of the loaded limno-corrals. The results suggest that the decrease was not, or only partially, caused by the lower food supply in the loaded limno-corrals, but directly by the heavy metals. Accompanying laboratory tests show significantly increased egg-development-times for two species of those animals from the loaded limno-corrals. It cannot be determined if increased mortality of particular animal stages was caused by heavy metals. (Deal-EIS)

MELIMEX, AN EXPERIMENTAL HEAVY METAL POLLUTION STUDY: EFFECTS OF INCREASED HEAVY METAL LOADS ON PHYTOPLANKTON COMMUNITIES,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
R. Gachter, and A. Mares.
Schweizerische Zeitschrift fur Hydrologie, Vol 41, No 2, p 228-246, 1979. 10 Fig, 3 Tab, 40 Ref.

Descriptors: *Heavy metals, *Toxicity, *Phytoplankton, On-site-investigation, Mercury, Copper, Cadmium, Zinc, Lead, Biomass, Photosynthesis, Inhibition, Adaptation, Zooplankton, Seasonal, Dominant organisms, Amino acids, Biochemistry, *Species diversity.

Long-term impacts of increased metal loading (Hg, Cu, Cd, Zn and Pb) on phytoplankton communities of large limno-corrals (diameter 12 m. depth 10 m) were studied. Increased metal concentrations initially lowered phytoplankton biomass, as well as species number and photosynthetic activity of phytoplankton. They caused changes in metal speciation and shifts in phytoplankton community structure, favoring less susceptible species. Although adaptation was not sufficient to completely prevent the metal-induced depression of photosynthesis, due to depressed zooplankton grazing, at the end of the experiment even higher phytoplankton densities were observed in the metal-loaded corrals than in the control. EFFECTS OF INGESTED CRUDE OIL ON BLACK GUILLEMOTS: A COMBINED FIELD AND LABORATORY STUDY,
Canadian Wildlife Service, Ottawa (Ontario). Wildlife Toxicology Div.
D. B. Peakall, D. Hallett, D. S. Miller, R. G. Butler, and W. B. Kinter.
Ambio, Vol 9, No 1, p 28-30, 1980. 4 Fig, 3 Tab, 18 Ref.

Descriptors: *Oil, *Toxicity, *Water birds, Analytical techniques, Methodology, On-site data collections, Oil pollution, Growth rates, Growth stages, Mode of action, Weight, Path of pollutants, *Tissue analysis, *Black guillemot, *Cepphus.

The experiment presented here was performed using a new experimental design for assessing pollutant toxicity. The technique permits carefully controlled experimentation on seabirds living normally in their chosen habitat, and is based on the observation that nestling black guillemots remain in their nest cavity for as long as 40 days after hatching during which period the adults continue to feed their young despite occasional disturbance by investigators handling the young for dosing and/or sampling. Toxicity studies thus made on individual nestlings involve minimal disruption of their normal way of life. At any point in the experiment, live birds or tissue samples can be transported to a laboratory for detailed physiological, biochemical and histological studies. The technique was then employed using a single dose of weathered crude oil. The data on the effect of oil on body weight suggest that a single dose of weathered crude oil could cause serious effects. Black guillemots which were dosed when they were roughly two weeks of age (about 125 g body weight) exhibited significantly smaller gains in body weight over the next three weeks than corresponding controls. At about five weeks of age (within one week of fledging), these experimentals were 20 percent lighter than controls. Since many oceanic bird species disperse into the open sea (alcids) or undertake long migrations (petrels) immediately after fledging one would expect that these lighter birds might be less able to survive this major period of stress. INFLUENCE OF SUMMER DROUGHT ON THE POPULATION OF AQUATIC INSECTS IN A TEMPORARY SALT-MARSH IN THE CRAU DISTRICT (MOUTH OF THE RIVER RHONE) (IN FRENCH),
Aix-Marseille-I Univ. (France). Lab. for Animal Biology-Ecology.
A. Thiery.
Annales Limnologie, Vol 15, No 2, p 181-191, 1979. 3 Fig, 11 Ref, (English Summary).

Descriptors: *Growth stages, *Droughts, *Insects, *Adaptation, Aquatic insects, Seasonal, Summer, Life cycles, Larval growth stage, Salt marshes, Dominant organisms, *Berosus, River Rhone, France.

In a temporary salt-marsh in Crau, the only insects adapted to the summer drought are species in the Hydrophilidae (Coleoptera), especially the dominant species Berosus guttalis. The life cycle of this species is described, and it is shown that, at the time of the drought, almost 80% of the larvae are in Stage III which is proved to be essential for pupation. This synchronization of larval development and summer drought ensure that the species has the highest chance of survival. (Deal-EIS)
W80-04907

A STUDY OF PERIPHYTON IN A POLLUTED RIVER (L'AGOUT) I. STRUCTURE AND DEVELOPMENT OF COMMUNITIES ON ARTIFICIAL SUBSTRATA. (IN FRENCH),
Toulouse-3 Univ. (France). Lab. d'Hydrobiologie.
J. Capblancq, and M. Cassan.
Annales Limnologie, Vol 15, No 2, p 193-210, 1979. 6 Fig, 1 Tab, 25 Ref. (English Summary).

Descriptors: *Periphyton, *Growth rates, *Metabolism, Biomass, Bioindicator, Water pollution, Benthic flora, Aquatic bacteria, Aquatic algae, Dominant organisms, Biological communities, Sphaerotilus, *Artificial substrates.

Artificial substrata, replaced every 20 days from June to November, have been used to study the production and structure of the community of benthic microphytes in a 50 km-section of a polluted river. The periphyton of this environment, largely dominated by the filamentous bacterium Sphaerotilus natans, is characterised by the poor development of algae and by rapid growth. The spatial and temporal changes in the growth rate of the phototrophic (P) and heterotrophic (H) communities, as well as the biomass ratio (P/H) and specific composition the biocoenosis, are related to the variations in the load of pollutant. The possibilities of utilising such indices for characterising levels of organic pollution are discussed. (See also W80-04909) (Deal-EIS)
W80-04908

A STUDY OF PERIPHYTON IN A POLLUTED RIVER (L'AGOUT) II. METABOLISM AND DYNAMICS OF GROWTH ON ARTIFICIAL SUBSTRATA, (IN FRENCH),
Institutet for Vatten- Och Luftvardsfor skning, Stockholm (Sweden).
J. Capblancq, and M. Cassan.
Annales Limnologie, Vol 15, No 2, p 211-222, 1979. 6 Fig, 21 Ref. (English Summary).

Descriptors: *Periphyton, *Growth rates, *Metabolism, Biomass, Bioindicators, Monitoring, Water pollution, Oxygen demand, Benthic flora, Water purification, Carbon radioisotopes, Tracers, *Artificial substrates, *Glucose.

Weekly samples from artificial substrata submerged at a point in a polluted river were used to follow the growth of periphyton over periods of 28 days. The biomass is chiefly filamentous bacteria and the changes in biomass show that the specific growth rate of benthic microphytes decreases as a function of the immersion period of the

substrata. It is the same for the metabolic activity of the periphyton, measured in the laboratory by the rate of oxygen consumption and by the assimilation kinetics of organic substances (14C-glucose). The contribution of benthic microphytes to the purification process and the results provided by artificial substrata are discussed. (See also W80-04908) (Deal-EIS)
W80-04909

THE EFFECT OF LEAD, CADMIUM, AND MERCURY ON THE INCREASE IN LENGTH OF FIVE INTERTIDAL FUCALES,
Trondheim Univ. (Norway). Museum.
T. Stromgren.
Journal of Experimental Marine Biology and Ecology, Vol 43, p 107-119, 1980. 6 Fig, 1 Tab, 31 Ref.

Descriptors: *Growth rates, *Phaeophyta, *Cadmium, *Lead, *Mercury, Heavy metals, Marine algae, Plant growth, Seasonal, Toxicity, Mode of action, Peluctia, Fucus, Ascophyllum, Growth enhancement.

The increase in length of Pelvetia canaliculata, Fucus spiralis, F. vesiculosus, F. serratus, and Ascophyllum nodosum was measured in various concentrations of lead, cadmium, and mercury during a period of 9-10 days. Concentration ranges of the three metals were 45-2600 microg/l, 1.5-1040 microg/l, and 0.9 1250 microg/l, respectively. Significant reductions of growth rate compared with the controls were observed at > 810 microg/l of lead, > 450 microg/l of cadmium, and > 10 microg/l of mercury, and significant regressions of growth reduction on log concentration were indicated. Growth was significantly enhanced in Pelvetia canaliculata and Ascophyllum nodosum when exposed to cadmium, and in this case there was a significant regression of growth increase on log concentration. The growth of Pelvetia canaliculata was also enhanced at all concentrations of lead. (Deal-EIS)

INFLUENCE OF COPPER SULPHATE ON THE STRUCTURE OF THE NET OF LARVAE OF HYDROPSYCHE (INSECTA, TRICHOPTERA), (IN FRENCH),
Baden-Wuerttemberg Landesanstalt fuer Umweltschutz (Germany, F.R.).
W. K. Besch, I. Schreiber, and E. Magnin.
Annales Limnologie, Vol 15, No 2, p 123-138, 1979. 17 Fig, 11 Ref. (English Summary).

Descriptors: *Copper sulfate, *Toxicity, *Insects, Animal behavior, Animal physiology, Mode of action, Copper compounds, Larval growth stage, Bioindicator, Bioassay, Methodology, Aquatic insects, *Hydropsyche.

Copper sulphate with an initial concentration as low as 125 microg Cu/l in hard water adversely affects the capacity of the larvae of Hydropsyche to spin nets. The irregularity that is first apparent is the high number of thread-interruptions. At higher concentration, the number of meshes per net decreases. A typical anomaly of the toxic action of copper is the deposition of threads as cotton-like harks instead of net tissues. The symmetry and regularity of the meshes in the catching area is only slightly affected by copper. This contrasts strikingly with the effects of a carbamate insecticide studied earlier. The primary site of the action of copper seems to be the silk gland and not the nervous system as is the case with the above pesticide. The findings in the laboratory confirm those made in the field. Concentrations which severly impair net construction are prohibitive for occurrence in nature. The Hydropsyche-test requires only short test-times and simple equipment and yet gives information on long term effects. (Deal-EIS)

THE DIFFERENT ADAPTABILITY OF FISH TO EUTROPHICATION, (IN GERMAN),
Staatliches Inst. fuer Seenforschung und Fischereiwesen, Langenargen (Germany, F.R.).
J. Hartmann.
Schweizerische Zeitschrift fur Hydrologie, Vol 41, No 2, p 374-382, 1979. 3 Fig, 2 Tab, 19 Ref. (English abstract).

Descriptors: *Eutrophication, *Lakes, *Fish populations, Yield equations, Adaptation, Water pollution, Perches, Dominant organisms, Salmonids, Commercial fish, Fish physiology, European lakes, Yellow perch, Pike, *Coregonus, *Abramis, Tinca.

The succession of yield of 10 fish species or genera in European lakes undergoing cultural eutrophication is described. Non-pelagic species often display no yield increase, whereas potential pelagic ones do for a time. Coregonus spp. and Perca fluviatilis exhibit yield increase and intensified yield fluctuations. A decrease of yield of the combined Coregonus spp. rarely has been observed in lakes with a mean depth more than 50 m. In respect to adaptability to rapid eutrophication, from yield patterns and changed biology three groups of fish are distinguished: (1) preadapted fish, as Stizostedion lucioperca; (2) obviously adapting ones, represented by potential pelagic-planktivorous species as Rutilus rutilus and P. fluviatilis; (3) not obviously adapting ones which include littoral fish as Esox lucius and Tinca tinca. (Deal-EIS)

INFLUENCE OF HYDROCARBONS ON ECOLOGY OF BACTERIA IN AEROBIC LAKE SEDIMENT, (IN GERMAN),
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
H. Buhrer.
Schweizerische Zeitschrift fur Hydrologie, Vol 41, No 2, p 315-355, 1979. 12 Fig, 13 Tab, 51 Ref.

Descriptors: *Oil, *Toxicity, *Bacteria, *Bottom sediment, Oil pollution, Lakes, Aerobic bacteria, Chemical analysis, Chlorophyta, Ecosystems, Growth rates, Dominant organisms, Water pollution effects.

Two different hydrocarbon loadings of sediment cores were analyzed 4 times during 21 days. Applied methods were: Direct count, isolation of more than 100 colonies on a diluted plate-count agar and estimation of 42 attributes (282 levels), followed by a single link clustering and calculation of the information basing on attribute level (i.e. negative entropy). Loading of 100 g fuel oil/sq m sediment caused a depletion of germs and information. Full restoration could not be observed. When 10 g fuel/sq m was applied there was no significant effect, but if algae were supplied too, the effect was similar to using 100 g/sq m. An extrapolation of the results gives a tolerance of hydrocarbon loading for Lake Constance or Lake Zug of 10 to 20 times the load present, but effects on fishes or fishfood were not considered. OIL SPILLS: A PUBLIC OFFICIAL'S HANDBOOK,
State Univ. of New York Coll. at Potsdam. Dept. of Anthropology.
J. T. Omohundro.
Cornell University Extension Publication, Information Bulletin 166, Social Sciences Sea Grant 3, March 1980. 19 p, 21 Ref.

Descriptors: *Oil spills, *Social aspects, Oil pollution, Water pollution treatment, Pollution abatement, *Public officials, Emergency action, Rehabilitation, *Handbook.

This handbook explains the social response to an oil or hazardous substance spill, particularly in water. The reactions of the victims and coastal residents of the impacted area are identified, and actions that may reduce social problems are suggested. The last section, 'Suggestions for Planning and Response,' may be consulted immediately in the event of a spill. An emergency checklist on the back cover addresses specific actions and guides the reader to appropriate sections of this handbook. The quick reference charts 1, 2, and 3 may serve as memory aids to the social context of particular problems. Official should find this handbook useful in preparing for public meetings and news conferences, in conducting personal interviews while reconnoitering or administering in the impacted area, and in handling telephone and written requests for information or help. (NOAA)

OIL SPILLS: A COASTAL RESIDENT'S HANDBOOK,
State Univ. of New York Coll. at Potsdam. Dept. of Anthropology.
J. T. Omohundro.
Cornell University Extension Publication, Information Bulletin 164, Physical Sciences Sea Grant 2, March 1980. 15 p, 5 Ref.

Descriptors: *Oil spills, *New York, *Great Lakes, *Coasts, Water pollution control, Pollution abatement, Water pollution treatment, *Human population, Emergency action, Area residents, *Handbook, Regional response team.

People living on or using the water bodies within and bordering New York State will find this bulletin valuable in case of an oil spill emergency. Knowledge of what can happen and what can be done in case of a spill emergency may save needless confusion, anxiety, and loss or damage. The first half of this bulletin explains what happens in a spill and what official parties will do. The self-help advise in the second half of this bulletin may reduce loss and damage to property owners or sportsmen on Lake Erie, Lake Ontario, the Saint Lawrence Seaway, Lake Champlain, the Hudson River, the Barge Canal System, New York Harbor, Long Island Sound or the Atlantic Ocean. The bulletin should be kept handy as a reference in time of emergency. (NOAA)

FISHING AND NORTH SEA OIL,
Department of Agriculture and Fisheries for Scotland, Edinburgh.
G. P. S. MacArthur.
Scottish Fisheries Bulletin 43, p 27-31, 1976.

Descriptors: *Fishing, *Oil industry, *Water pollution effects, Resources development, Oil pollution, Oil spills, Environmental effects, Outer Continental Shelf, North Sea, Environmental impact, Petroleum development.

Consultations between the fishermen and oil-men who share the North Sea, fall into two broad categories; direct consultations between representatives of fishermen and an individual oil company concerning a specific offshore development; and the broader consultations which take place in the Fisheries and Offshore Oil Consultative Group (FOOCG), on which both industries are represented. Under the auspices of FOOCG a factual study has been made to ascertain as far as possible the effect of North Sea Oil and gas installations on access to fishing grounds. Although a broad assessment of the effect can be made on the basis of a number of assumptions the study disclosed, there are difficulties in attempting to quantify the precise effect. The areas involved are small in relation to fishing patterns, which themselves undergo change for reasons unrelated to offshore developments. As offshore exploration continues and finds already made and finds still to be made are exploited it is all the more important to ensure that these offshore activities interfere with fishing as little as possible. SEA OTTER DISTRIBUTION AND ABUNDANCE SOUTHERN KODIAK ARCHIPELAGO AND THE SEMIDI ISLANDS,
Alaska Dept. of Fish and Game, Anchorage.
K. Schneider.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investi-

gators for year ending March 1979. Vol I, Receptors--Mammals--Birds, p 169-191, October 1979. 12 Fig, 12 Tab, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-69.

Descriptors: *Mammals, *Otters, *Oil pollution, *Water pollution effects, Environmental effects, Baseline studies, Ecology, Resources development, Alaska, *Outer Continental Shelf, Kodiak Island, Semidi Islands, Petroleum development.

Sea otters have been sighted throughout the shallow waters southeast of Kodiak Island but established breeding groups occupy only two areas. The largest colony inhabits the waters south of the Trinity Islands and is roughly estimated to number between 400 and 700 sea otters. A second concentration of less than 100 sea otters exists around Chirikof Island. Sea otter densities in these areas are believed to be well below the capacity of the habitat but numbers are increasing. Both colonies are vulnerable to oil spills because of their small size, limited distribution and proximity to proposed OCS lease tracts. Sea otters have been present in the Semidi Islands at least since 1957. The present population is small (30 to 50 animals) and not occupying all available habitat. (Sinha-OEIS)

BELUKHA WHALES IN LOWER COOK INLET,
Alaska Dept. of Fish and Game, Anchorage.
N. Murray.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol I, Receptors--Mammals--Birds, p 192-208, October 1979. 1 Fig, 28 Ref, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-5-022-69.

Descriptors: *Mammals, *Oil pollution, *Water pollution effects, Baseline studies, Ecology, Environmental effects, Resources development, Alaska, *Outer Continental Shelf, Cook Inlet, *Belukha whales.

The Cook Inlet belukha population has been estimated at 300 to 400, and is thought to be resident in the Inlet year-round. Sighting data confirms that belukhas are present in all seasons. Belukhas are seasonally distributed in the different regions of the Inlet. They have been sighted in the Upper Inlet primarily in late spring and summer. Belukhas are seen throughout the year in the central and lower areas, with heaviest use occurring in the central Inlet area. Within the Inlet, numbers appear to fluctuate seasonally, with the greatest number seen in mid to late summer and the fewest in winter. Ice conditions may have a strong correlation with winter abundance. The habitat types used by belukhas appear to fall into four categories: migration routes, feeding grounds, breeding grounds and calving/nusery grounds. Food resources may be the critical element determining the interrelationship of habitat requirements. The habitat requirements vary seasonally and with the age and sex of the whale. The seasonal variations are dynamic and introduce difficulties in determining simple habitat requirements. (Sinha-OEIS)

ECOLOGICAL STUDIES OF BIRDS IN THE NORTHERN BERING SEA: SEABIRDS AT BLUFF, DISTRIBUTION OF BIRDS AT SEA, MOVEMENTS OF BIRDS IN THE BERING STRAIT,
College of the Atlantic, Bar Harbor, ME.
C. Ramsdell, and W. H. Drury.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol I, Receptors--Mammals--Birds, p 600-769, October 1979. 27 Fig, 32 Tab, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-6-022-35208.

Descriptors: *Birds, *Waterfowl, *Shore birds, *Oil pollution, *Water pollution effects, Environmental effects, Baseline studies, Resources development, Alaska, *Outer Continental Shelf, Petroleum development, Bering Sea, Bering Strait.

The goal of this study is to assess the present environmental conditions in the northern Bering Sea and Bering Strait while specific objectives are to determine the breeding areas and seasonal changes in density and distribution of the principle seabird species; and to describe the trophic relations of selected species. Studies were concentrated on two numerous and widespread species, Common Murres and Black-legged Kittiwakes, because they are convenient to study and offer opportunity to compare results with those obtained by others in other parts of these well-studied species' ranges. Some of the most obvious effects of hydrocarbon exploration and transport on birds may include: (1) direct disturbance by the presence of and activities associated with heavy equipment; (2) pollution of the waters by hydrocarbons and other industrial chemicals; (3) direct disturbance by increased human activity associated with development; (4) secondary effects reflecting increased land development for support facilities and transportation corridors; (5) secondary effects reflecting the recreational demands of additional people travelling off regular transportation corridors; (6) effects of increased human activities involving species which are sensitive to disturbance by humans or which attract human hunting or curiosity; (7) effects of human activities that will provide a sibsidy for aggressive species able to take advantage of resources, e.g., food from wastes; and (8) secondary effects of the impact of aggressive species benefitting from human development, on sensitive species vulnerable to competition. The overall objective of this program was to assess potential effects of petroleum and petroleum-related operations on marine organisms indigenous to Alaskan waters. Several principal objectives addressed by this research were: (1) to evaluate the effect of petroleum on sensory systems and behavior of marine species by determining if petroleum in sediment causes flatfish to avoid the contaminated area or interferes with normal feeding and activity patterns, and evaluating the effect of crude oil exposure on defensive behavior of a sea urchin; (2) to investigate the metabolism and disposition of petroleum hydrocarbons in demersal fish; (3) to develop and refine ultrastructural criteria for assessing cellular damage in marine organisms resulting from exposure to petroleum; (4) to detect and characterize pathological changes resulting from the exposure of flatfish to sediments contaminated with crude oil and to detect effects of petroleum exposure on flatfish disease resistance; and (5) to determine if petroleum-exposed eggs and larvae of salmon and flatfish develop abnormally, and to evaluate the effect of any detected abnormalities on survival. The conclusions of this program are summarized according to disciplinary areas of study. Research findings from this program have clear implications with respect to petroleum effects on aquatic species and consequently to OCS oil and gas development. (Sinha-OEIS)

BEAUFORT SEA BARRIER ISLAND-LAGOON ECOLOGICAL PROCESS STUDIES. SECTION I - AVIAN ECOLOGY IN SIMPSON LAGOON, BEAUFORT SEA, ALASKA,
LGL Ltd., Edmonton (Alberta).
S. R. Johnson.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VI, Effects, p 238-362, October 1979. 7 Fig, 31 Tab, 35 Ref, 2 Append, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-6-022-35193.

Descriptors: *Birds, *Ecology, *Habitats, *Environmental effects, Alaska, Migration, Breeding, Resources development, Oil industry, *Outer Continental Shelf, Petroleum development, Feeding, Molting, Beaufort Sea, Simpson Lagoon.

The general scope of the ornithological components of this study, which was sited primarily in the Simpson Lagoon area, was to characterize the use of nearshore habitats by birds and to clarify those critical feeding and habitat dependencies that development is likely to affect either directly, or indirectly via alteration of ecosystem processes. The research program addresses four ecosystem uses/dependencies of birds--for migration, breeding, feeding and staging-molting. These uses are evaluated as they relate to barrier island-lagoon habitats and predicted development alterations of habitats. Some general conclusions were that: (1) bird utilization of nearshore lagoon areas was minimal while these areas remained frozen in spring and early summer so that potential impacts of development are probably low at this time except for those activities that would create open water attractive to birds; (2) heaviest use of near-shore barrier island-lagoon areas by birds occurred during the open-water season--late July through August and September. Primary use of the area at this time was by molting and migrating oldsquaws and staging shorebirds. Feeding activity in the area was intensive by all these birds. Potential impacts of development would be most serious during this open-water season. (Sinha-OEIS)

BEAUFORT SEA BARRIER ISLAND-LAGOON ECOLOGICAL PROCESS STUDIES. ECOLOGY OF INVERTEBRATES IN SIMPSON LAGOON, BEAUFORT SEA, ALASKA,
LGL Ltd., Edmonton (Alberta).
W. B. Griffiths, and R. E. Dillinger.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VI, Effects, p 471-600, October 1979. 28 Fig, 22 Tab, 74 Ref, 10 Append, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-6-022-35193.

Descriptors: *Invertebrates, *Ecology, *Oil pollution, *Sediments, *Environmental effects, *Water pollution effects, Lagoons, Barrier islands, Currents, Resources development, Alaska, *Outer Continental Shelf, Beaufort Sea, Simpson Lagoon, Epibenthic community, Nearshore currents, Environmental impact, Petroleum development.

Invertebrate investigations in the Simpson Lagoon area on the Alaskan Beaufort Sea Coast concentrated on those organisms identified as important food items to higher trophic levels (fish and birds). The main objectives of the research were to study the seasonal and habitat distributions, abundances and biomasses, and life histories of these important organisms. A potential cause of adverse impacts to epibenthic invertebrates is the construction of causeways or other structures that would block important movements of these invertebrates. The movements that appear important to some of the species include those between the lagoon and off-

shore. Another potential disturbance related to petroleum development on the continental shelf is contaminant (e.g., oil) introductions. Adverse impacts of oil on invertebrates might indirectly affect the fish and birds that depend on those invertebrates for food. Previous investigations have shown that responses of epibenthic invertebrates to oil are highly variable, but that adverse effects occur under some circumstances. In the nearshore environment, invertebrates could be affected by oil in the water column or (probably more critical to epibenthos) by oil on and in benthic substrates. (Sinha-OEIS)

BEAUFORT SEA BARRIER ISLAND-LAGOON ECOLOGICAL PROCESS STUDIES. OCEANOGRAPHIC AND GEOLOGIC PROCESSES--A SYNTHESIS OF ECOLOGICALLY IMPORTANT INFORMATION,
LGL Ltd-U.S., Inc., Grand Junction, CO.
J. C. Truett.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VI, Effects, p 601-664, October 1979. 2 Fig, 102 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. 03-6-022-35193.

Descriptors: *Geomorphology, *Resources development, *Water circulation, Geology, Baseline studies, Alaska, Transport, Environmental effects, Water pollution effects, *Outer Continental Shelf, Beaufort Sea, Coastal processes, Petroleum development, Ecological crises.

This report synthesizes and interprets, from reports of Barrier Island-Lagoon Program participants and from the general literature, data about selected oceanographic and geologic processes in coastal regions. Processes discussed are water circulation and exchange; detritus sources, transport mechanisms and sinks; and the origin and evolution of coastal landforms. The purpose of the synthesis is to provide a more realistic assessment of the ecological consequences of man's alteration of these processes in the Beaufort Sea. The processes investigated are those which strongly influence populations of selected key species of animals in the coastal environment and those affected by oil and gas exploration and development activities on the continental shelf. OBSTACLES TO GEOTHERMAL DEVELOPMENT,
S. P. Budiansky.
Environmental Science and Technology, Vol 14, No 3, p 255-257, March, 1980. 1 Fig.

Descriptors: *Geothermal studies, *Legal aspects, *Financial feasibility, *Environmental effects, Ground water, Water pollution, Land subsidence, Water table, Air pollution, Hydrogen sulfide, Water law.

Legal, financial, and environmental problems associated with geothermal development are minor compared with problems associated with the development of other energy resources. However, these problems must be solved if delays are to be avoided. Direct use of geothermal energy, unlike high-temperature applications, does not cause air pollution but can result in water pollution. The use of injection wells can minimize ground water pollution, water table lowering and land subsidence. The deterioration of ground water quality surrounding an injection well over a 30 year period has been simulated by researchers at EG and G Idaho. Direct use applications are also faced with laws and regulations which were based on the concept of high-temperature, electric-generating, and revenue producing resources. These laws do not apply to low-temperature resources. With some modification, existing water law can provide the basis for direct use development. For example, geoheating would be classified as 'reasonable use' of water resources, and appropriate rights over the entire volume of the resource should not be required for closed systems which return the water they use. THE SIGNIFICANCE OF VITAMINS AND THE EPIPHYTIC BACTERIAL COMMUNITY IN THE NUTRITIONAL ECOLOGY OF CLADOPHORA GLOMERATA,
Wisconsin Univ.-Madison. Dept. of Botany.
J. P. Hoffmann, and G. C. Gerloff.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182793, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Center, University of Wisconsin Technical Completion Report WIS WRC 80-07, 1980. 24 p, 8 Fig, 6 Tab, 40 Ref. OWRT A-074-WIS(1), 14-34-0001-7105; 14-34-0001-7106; 14-34-0001-8053.

Descriptors: *Vitamin B, *Chlorophyta, *Algae, *Nuisance algae, *Bacteria, *Growth rates, Analytical techniques, Statistical methods, Effects, Temperature, Light intensity, Photoperiodism, Nutrients.

The effects of vitamin B1, vitamin B12, temperature, light intensity and photoperiod on growth and zoosporogenesis were investibated by factorial experiments. Statistical analysis showed all effects to be significant as well as some of the interaction terms. Zoosporogenesis was more sensitive to vitamin limitation than was dry weight production. Growth and dry weight production exhibited significantly different optima. Growth was most strongly influenced by temperature whereas photoperiod exerted the strongest influence on zoosporogenesis. Due to the experimental design it was possible to separate the light intensity and photoperiod effects and analysis showed photoperiod to have a primary influence on zoosporogenesis. An 8:16 short day photoperiod elects the greatest number of zoosporangia.

PHYTOPLANKTON AND ENVIRONMENTAL CONDITIONS IN CENTRAL AND COASTAL AREAS OF THE BOTHNIAN BAY,
Oulu Univ. (Finland). Perameri Research Station.
E. Alasaarela.
Annales Botanici Fennici, Vol 16, No 3, p 241-274, 1979. 23 Fig, 4 Tab, 136 Ref, 1 Append.

Descriptors: *Basic data collections, *Phytoplankton, *Nutrients, *Bothnian Bay(Finland), *Primary productivity, Sampling, Salinity, Temperature, Hydrogen ion concentration, Phosphorus, Phosphate, Iron, Nitrogen, Nitrates, Color, Chlorophyll, Biomass, Diurnal distribution, Algae, Hydrography, Chlorophyta, Coastal waters, Dinoflagellates, Diatoms, Chrysophyta, Cryptophyta, Cyanophyta, Surveys, Finland, Baltic Sea.

The seasonal variation of phytoplankton production, biomass and species composition, and the environmental factors regulating them in the Bothnian Bay, Baltic Sea, were studied in 1976 and 1977 as part of the basic biological survey made of the coastal waters off Oulu, Finland. The outermost sampling stations represent the open waters of Bothnian Bay, while the coastal area is influenced by river waters polluted by industrial and domestic sewage. Results showed that in summer, the surface salinity was 1-3% in the coastal waters and 3.0-3.2% in the open sea. In April, when incident radiation was high, a relatively dense phytoplankton community developed under the ice in both areas. In summer, phytoplankton production showed two peaks in the coastal waters, which were not clearly discerned in the open sea where the primary production and phytoplankton biomass were low. In the open sea, phosphate was very scarce but nitrate was fairly abundant. The phosphate concentration was notably higher in the coastal waters, but nitrate was depleted by the early summer phytoplankton maximum. Hydrography and nutrients considered were temperature, salinity, pH, transparency, iron, phosphorus, nitrogen, and total nitrogen to total phosphorus ratio. Chlorophyll-a, total phytoplankton biomass, daily and annual primary production, thickness of the euphotic layer, intensity and diurnal variation of primary production and important phytoplankton groups and species were also reported. (Luedtke-Wisconsin)

LIGHT INDEPENDENT CARBON FIXATION BY MARINE MACROALGAE,
Cologne Univ. (Germany, F.R.). Botanisches Inst.
B. P. Kremer.
Journal of Phycology, Vol 15, No 3, p 244-247, September 1979. 3 Tab, 13 Ref.

Descriptors: *Marine algae, *Carbon cycle, *Intertidal areas, *Kelps, *Photosynthesis, Marine microorganisms, Carbon fixation, Chlorophyta, Rhodophyta, Phaeophyta, Carboxylation, Dark carbon fixation, Carboxylating enzymes.

Several marine macroalgae representative of Chlorophyceae, Rhodophyceae, and Phaeophyceae were investigated for their potentials of photosynthesis and light independent (dark) carbon fixation. Photosynthesis rates, expressed as net carbon assimilation on a dry weight basis, were of the same order of magnitude in all algal classes. The amounts of photosynthetically fixed carbon on thallus surfaces ranged between 30 and 80 micromol C02/sq dm/hour, and were comparable to the photosynthetic capacities of average terestrial plants. Phaeophyceae achieved considerable rates of light independent carbon fixation, which exceeded photosynthetic rates by 4-5%. In contrast to the species of Chlorophyceae and Rhodophyceae examined, Phaeophyceae showed high activities of phosphoenolpyruvate carboxykinase (PEP-CK) in absolute terms and relative to ribulose-1,5-bisphosphate carboxylase (RubP-C). The composition of the soluble fraction after dark fixation of 14C02 was different from that after photosynthetic carbon assimilation. The neutral fraction of soluble carbohydrates and of organic phosphates accounted for less than 3% of the total C14-labelled assimilates were amino acids (aspartate, glutamate, alanine, and glutamine) and intermediates of the tricarboxylic acid cycle. Asparate, alanine, and citrate constituted the most strongly C14-labelled compounds in the Phaeophyceae, while citrate, although less strongly C14-labelled, was significant in the Rhodophyceae. (Harris-Wisconsin)

CHLORIDE UPTAKE BY ANACYSTIS NIDULANS (CYANOPHYCEAE),
Queen's Univ., Kingston (Ontario). Dept. of Biology.
S. R. Craig, and K. Budd.
Journal of Phycology, Vol 15, No 3, p 300-304, September 1979. 3 Fig, 3 Tab, 19 Ref.

Descriptors: *Chlorides, *Cyanophyta, *Cytological studies, *Nutrient transport, *Photosynthesis, *Metabolism, Kinetics, Algae, Anacystic, Light, Darkness, Biochemistry, Respiration, Inhibitors, Cultures, Tracers, Nutrients, Nutrient requirements, Bacteria, Energy.

Results of experiments investigating chloride uptake by cyanobacteria Anacystis nidulans show that light enhances chloride uptake; therefore, chloride uptake is active with ATP as the most likely energy source. Anacystis nidulans, grown in batch culture with 0.5% C02 in air, was supplied with chloride labelled with C1-36 in light and darkness. Chloride in cells reaches a maximum after 30-50 min at 25C. At this point, internal C1-concentrations are 60-fold external (0.1 mM) con-

centrations in light, 37-fold external concentrations in darkness. Relationships of Cl- uptake to metabolism were investigated using DCMU and DCCD inhibitors and CCCP uncoupling agent. DCMU immediately stops oxygen evolution in light. CCCP has no detectable influence on photosynthesis or dark respiration below 1 microM; above this concentration photosynthesis is progressively inhibited whereas dark respiration is stimulated. DCCD, an energy-transfer inhibitor, progressively inhibits photosynthesis as time and concentration increase; however, dark respiration is unaffected or even stimulated. With DCMU at 10 micro M, light stimulation of Cl- uptake occurs. CCCP strongly inhibits Cl- uptake in light and darkness. DCCD has no effect on dark Cl- uptake and inhibits light Cl- uptake more slowly than photosynthesis. (Danovich-Wisconsin)
W80-05023

PHOSPHATE-LIMITED GROWTH KINETICS OF SELENASTRUM CAPRICORNUTUM (CHLOROPHYCEAE),
Alaska Univ., Fairbanks. Inst. of Water Resources.
E. J. Brown, and D. K. Button.
Journal of Phycology, Vol 15, No 3, p 305-311, September 1979. 4 Fig, 1 Tab, 35 Ref. NSF DEB77-08427.

Descriptors: *Phosphates, *Growth rates, *Kinetics, *Orthophosphate, *Selenastrum, Chlorophyta, Cultures, Nutrients, Limiting factors, Cytological studies, Metabolism, Speciation, Nutrient requirements, Monod equation, Michaelis-Menton equations, Phytoplankton, Algae, Phosphates.

Steady-state phosphate-limited growth kinetics of Selenastrum capricornutum were examined using continuous cultures to characterize the green alga's ability to compete for orthophosphate (OP) when OP limits growth. Comparable data obtained for aquatic yeast Rhosdotorula rubra and similar data for diatom Asterionella formosa indicate that both the heterotrophic yeast and the diatom have a competitive growth advantage over Selenastrum in OP-limited steady-state systems. Thus for Selenastrum to predominate in a mixed species environment truly limited by phosphorus, factors other than steady-state OP-limited growth must regulate total biomass production. Selenastrum maximum specific growth rate at 20C is 1.20/d, and the concentration where half maximal growth rate occurs is 40 nM OP. An apparent external phosphate threshold occurs at 10 nM OP, below which net phosphate is zero. Cell yields vary inversely with growth rate; thus ability to utilize OP can not be characterized in terms of Monod half-saturation constant and maximal growth rate. Instead, OP affinity is calculated from steady-state flux vs external OP concentrations. The steady-state flux derived phosphate affinity of this aquatic organism is relatively low, 2.8 l/mg dwt d. These experiments provide kinetic evidence against theoretical phytoplankton growth studies which assume that relative nutrient utilization abilities regulate species composition. (Danovich-Wisconsin)

A CONSIDERATION OF TROPHIC DYNAMICS IN SOME TALLGRASS PRAIRIE FARM PONDS,
Kansas State Univ., Manhattan. Div. of Biology.
J. A. Arruda.
The American Midland Naturalist, Vol 102, No 2, p 254-262, October 1979. 2 Fig, 3 Tab, 23 Ref.

Descriptors: *Primary productivity, *Predation, *Farm ponds, *Ecosystems, *Kansas, *Food chains, *Food pyramids, Biomass, Trophic level, Variability, Population dynamics, Ecotypes, Size, Aquatic insects, Aquatic populations, Biological communities, Balance of nature, Secondary productivity, Food abundance, Standing crops, Diptera, Grasslands.

Data from five farm ponds in Kansas, sampled in summer 1975, supported Fretwell's construct that some ecosystem patterns are explained by interactions between primary productivity and predation. While these two factors do not completely regulate these farm pond ecosystems, they account for some of the observed variation. The biological null hypothesis that no relationship exists between biomasses of the ponds' trophic levels and their primary production is rejected. Biomass increases by both primary and tertiary consumers, the food-limited levels, and decreases by both secondary consumers and littoral producers, the predator-limited levels, is consistent with Fretwell's construct. As primary production increases and organic matter is incorporated into higher trophic levels, the abundance of the top predator increases. Abundance of the predator-limited trophic level below it decreases because its predator is more abundant. The next trophic level below increases due to lower predation. Patterns in body size of two major consumers, damselfly naiads and chironomid larvae, are strongly corroborative of Fretwell's construct. Along with decline in biomass, damselfly naiads' mean body size decreases. The opposite is true for midge larvae; they are larger where biomass increased and individual numbers decreased. These latter results occur when predator pressure decreases and competitive interactions in the new food-limited environment are more severe. Data are suggestive of patterns in ecosystem structure: patterns mediated by interactions between energy available to consumers and predation intensity. (Danovich-Wisconsin)

EFFECT OF NITRIFICATION IN ORTA LAKE,
Consiglio Nazionale delle Ricerhe, Milan (Italy).
M. Gerletti, and A. Provini.
Progress in Water Technology, Vol 10, No 6, p 839-851, 1978. 5 Fig, 5 Tab, 17 Ref.

Descriptors: *Nitrification, *Orta Lake, Italy, *Water chemistry, *Industrial wastes, *Hydrogen ion concentration, *Water pollution effects, Denitrification, Ammonia, Dissolved oxygen, Nitrates, Nitrites, Copper, Hypolimnion, Epilimnion, Ions, Seasonal, Hydrologic aspects, Chemical properties, Stratification, Alkalinity.

Lake Orta, Italy, subjected to industrial wastewaters from cuproammonia rayon factory since 1927, has a 1975 mean nitrification rate of 3-5 micro g N/l d because nitrification inhibiting substances are absent. Lake waters average 11 mg/l total inorganic nitrogen. Lake Orta has 18.1 sq km surface area, 143 m maximum depth and 71 m mean depth. Original natural alkalinity should have ranged 7-12 mg CaC03/l in relation to its granitic drainage basin; however, Orta has probably been acidic for 30 years. Ionic composition of lake waters gradually changed from a soft bicarbonate to a unique sulfate-nitrate-ammonia type with pH fluctuations governed by excess ammonia or nitric ions. Hypolimnion pH values are annually constant near 4; epilimnion pH values are low during winter and increase to 9 spring to autumn. Hypolimnetic temperature and pH do not vary significantly during the year; consequently nitrification is constant, although it is slow. Denitrification may occur in deep hypolimnion layers at the end of thermal stratification when oxygen concentrations are low. During spring to autumn 459-711 tons of ammonia are lost in the hypolimnion while nitrates increased slightly. During this time, nitrites are not important. Denitrification processes probably cause the observed changes. (Danovich-Wisconsin)
W80-05026

SEASONAL VARIATION OF DENITRIFICATION RATE IN SEDIMENT DETERMINED BY USE OF N15,
Danish Isotope Center, Copenhagen.
P. P. Madsen.
Water Research, Vol 13, No 5, p 461-465, 1979. 2 Fig, 3 Tab, 21 Ref.

Descriptors: *Seasonal, *Denitrification, *Tracers, *Arreso Lake, Denmark, *Lake sediments, *Laboratory tests, Sediments, Gases, Nitrogen, Nitrates, Analytical techniques, Methodology, Spectrometers, Isotope studies, Ammonia, Organic compounds, Nitrogen cycle.

Based on annual measured-rate constants and nitrate concentrations, approximately 10% of the total nitrogen loading of Lake Arreso, Denmark, is denitrified. Measurements performed March-November 1977 on Lake Arreso sediments indicate first-order kinetics of denitrification with respect to nitrate concentration; the first-order rate constant (KD) varies 0.4-40 micro sec. KD seasonal changes are due to variations in organic matter availability. Variations in oxidizable organic matter correlate to algae growth and sedimentation during the year. Maximum KD values occur in August coinciding with maximum sediment oxygen consumption. First-order nitrate reduction rate constant, KA, ranges 2-8 micro sec. An estimated 1.3 g N/sq m yr is denitrified; results are reasonable compared with a total 10-15 g N/sq m yr nitrogen loading. Arreso is a shallow, unstratified lake situated north of Copenhagen; it has a 41 sq km area and 7 m maximum depth. Determinations of nitrogen gas evolved from N15-labelled nitrate is based on isotope dilution. Gas evolved is spiked with unlabelled dinitrogen; N15-enrichment of the resulting gas mixture is measured by optical spectrometry. The method allows simultaneous measurements of nitrate reduced to ammonia and organic nitrogen. (Danovich-Wisconsin)

PHOSPHORUS LOADING FROM URBAN STORMWATER RUNOFF AS A FACTOR IN LAKE EUTROPHICATION: I. THEORETICAL CONSIDERATIONS AND QUALITATIVE ASPECTS,
Wisconsin Univ. Madison. Dept. of Soil Science.
M. G. Browman, R. F. Harris, J. C. Ryden, and J. K. Syers.
Journal of Environmental Quality, Vol 8, No 4, p 561-566, October-December 1979. 1 Fig, 4 Tab, 33 Ref. NSF AG-199, 40-193-69.

Descriptors: *Phosphorus, *Urban runoff, *Lake Wingra(WI), *Storm runoff, Theoretical analysis, Phosphorus compounds, Inflow, Runoff, Organic compounds, Leaves, Orthophosphate, Hydrographs, Sampling, Settling velocity, Seasonal, Flow, Flow profiles, Flow rates, Nutrients, Nutrient loading.

Theoretical fractionation of urban phosphorus (P) runoff reveals that for major loading phases of runoff events, a significant proportion (35-50%) of particulate P commonly remains in suspension in the photic zone for several days, interacting with lake water and biological components. Urban P runoff from two separate storm sewer systems draining residential areas in the Lake Wingra Basin, Madison, Wisconsin, were monitored fall 1971-summer 1972. In general, the highest total dissolved P levels are obtained in fall and spring runoff, coinciding with leaf fall and elm fruit fall, respectively. Dissolved inorganic P constitutes at least 79% and often > 90% of total dissolved P, indicating that almost all dissolved P in this runoff is directly available for algal uptake subject to other conditions such as light and temperature. Flow-weighted mean concentrations of total particulate P ranges 0.14-2.37 mg P/l; for dissolved inorganic P concentrations are 0.10-2.11 mg/l for individual runoff events. For all flow periods, a major portion of the total particulate P comprises particles that settle very slowly (<0.1 cm/min); in low-flow periods 74%-80% fall into this class. These particles are likely to remain in the photic zone for several days. Particles settling at >1 cm/min provide significant portions (18%-34%) of total particulate P during initial flush and highflow periods, but contribute nothing to the subsequent low-flow period. (Danovich-Wisconsin)

Descriptors: *Seasonal, *Bay of Quinte, Lake Ontario, *Bacteria, *Sediments, *Water temperature, Great Lakes, Lake sediments, Population dynamics, Growth rates, Population, Speciation, Biomass, Cultures, Temporal distribution, Heated water,

Pseudomonas, Flavobacterium, Chromobacterium, Sampling, Sediment-water interfaces.

Regardless of season, all sediment samples collected from the Bay of Quinte, Lake Ontario, July and November 1977 and February and May 1978, contain large psychrotropic bacterial populations. Sediment temperature range is 18.8C, 4C, 4C and 5C in July, November, February and May, respectively. Sediments with lower insitu temperatures have higher numbers of viable bacteria. Sediment temperature affects not only bacteria numbers but also population composition. November, February and May samples contain a greater percentage of chromogenic bacteria than the July sample. Bacteria isolated from any given sample and incubated at 20C give equal or higher numbers than sediments incubated at 0C. Almost all bacteria isolated at 0C in July also grow at 20C; even in February and May samples, 90% of the population isolated at 0C grows at 20C. Only 73% of the bacteria isolated at 20C in July grows at 0C, with higher percentages in November, February and May sediment samples. Pseudomonas dominates in July samples at both 0C and 20C isolation temperatures, whereas Flavobacterium prevails in November, February and May samples. Pseudomonas and Flavobacterium are the most frequently isolated genera. Chromobacterium is found in relatively low numbers in November, February and May samples. Diversity is higher in colder sediments; the July sample has the lowest population diversity. (Danovich-Wisconsin)

EFFECTS OF HYPOLIMNETIC AERATION ON NITROGEN TRANSFORMATIONS IN SIMULATED LAKE SEDIMENT-WATER SYSTEMS,
Wisconsin Univ. Madison. Dept. of Soil Sciences.
R. L. Chen, D. R. Keeney, and L. J. Sikora.
Journal of Environmental Quality, Vol 8, No 3, p 429-433, July-September 1979. 4 Fig, 4 Tab, 18 Ref. EPA R-802692-01-0.

Descriptors: *Nitrogen cycle, *Lake restoration, *Aeration, *Cox Hollow Lake(WI), *Oxidation-reduction potential, Lakes, Nitrogen, Eutrophication, Anaerobic conditions, Cycling nutrients, Nitrification, Denitrification, Sediment-water interfaces, Laboratory tests, Chemical analysis, Nitrates, Nitrites, Ammonia, Hypolimnion.

Laboratory tests of nitrogen (N) transformations on lake water and sediment samples obtained from Cox Hollow Lake, a southwestern Wisconsin recreational impoundment, occurs soon after hypolimnion aeration. Therefore, hypolimnion aeration is not an effective way to remove N from lakes. However, shortly after nitrification occurs in aerated lakes, the rate of nitrare formation is limited by ammonia depletion. Nitrates are subject to several reactions; some interact with the diffuse sediment-water interface where they encounter a highly reduced environment. In Cox Hollow sediment, 60-65% of the nitrates are immobilized to ammonia and organic N. Hence, although nitrates disappear from the hypolimnion during aeration, a large net N loss does not occur. Other studies show that Lake Mendota sediments immobilize 30% and Green Bay sediments (WI), 10% of the nitrates added. Larger net N losses by denitrification are expected if aeration is discontinued at maximum nitrate accumulation, which occurs two weeks after initial aeration in these experiments. Cox Hollow Lake has 8.8 m maximum depth and loses its dissolved oxygen below 2 m during summer stratification. Samples were collected at 8.5 m in July 1975. (Danovich-Wisconsin)

CELLULOSE PRODUCTION BY PLANKTONIC ALGAE IN LACUSTRINE ENVIRONMENTS,
Massachusetts Univ. Amherst. Dept. of Environmental Sciences.
J. Rho, and W. Litsky.
Hydrobiologia, Vol 66, No 3, p 249-258, October 1979. 3 Fig, 6 Tab, 21 Ref.

Descriptors: *Phytoplankton, *Carbohydrates, *Cellulose, *Lentic environment, *Lakes, Eutrophication, Farm ponds, Oligotrophy, Photosynthesis, Organic matter, Chlorophyta, Cyanophyta, Primary productivity, Quabbin Reservoir, Massachusetts, Decomposing organic matter, Degradation(Decomposition), Seasonal, Algae, Speciation.

Cellulose production by planktonic algae in an eutrophic pond (Amherst, Massachusetts) and in an oligotrophic lake (Quabbin Reservoir, Massachusetts) indicates that algal cellulose production exceeds decomposition and cellulose remains in the water column for long time periods. Absorption spectra of C-fractions extracted from algal cells indicate that algae are the major cellulose contributors of particulate matter. In both the lake and pond, various Chlorophyceae are the most common algal cellulose producers. Cellulose content of dominant algal cellulose producers ranges 2%-39% of total dry weight, depending on algal species and growth phase. Amounts of cellulose present in the water column range 4%-50% of total particulate matter dry weight. Cellulose contents are higher in the eutrophic system than in the oligotrophic system, probably due to presence of larger phytoplanktonic crops in the eutrophic system. During summer months, when algal populations reach maximum, particulate matter cellulose content ranges 8%-31%. During winter and spring, when algal populations are low, the cellulose percentage in water column varies 0.1%-2%. More cellulose is present in the water column than is accounted for by the number of algal cells observed. Differences are due to cellulose accumulation from previous algal crops. (Harris-Wisconsin)

SPECIATION AND RATE OF LOSS OF COPPER FROM LAKEWATER WITH IMPLICATIONS TO TOXICITY,
Department of Fisheries and Oceans, Winnipeg (Manitoba). Freshwater Inst.
R. Wagemann, and J. Barica.
Water Research, Vol 13, No 6, p 515-523, 1979. 4 Fig, 6 Tab, 39 Ref.

Descriptors: *Copper, *Toxicity, *Manitoba, Canada, *Algicides, *Chemical reactions, Algae, Algal control, Algal poisoning, Algal toxins, Water chemistry, Hydrogen ion concentration, Lakes, Copper compounds, Copper sulfate, Inorganic compounds, Copper sulfate, Kinetics, Equilibrium, Biochemistry, Cyanophyta.

Copper effectiveness as an algicide in lakes in southwest Manitoba depends upon the total toxic copper concentration, which is equal to the sum of three species ($Cu+2$, $CuOH+$, $Cu(OH)0$ sub 2). Total toxic copper explains the unexpectedly high effectiveness of copper as an algicide in aquatic systems with relatively high pH. Total toxic copper is larger in the six prairie, pothole, hard-water lakes, at any time, than cupric ion concentration alone by a factor 320-7400, depending on the lake. This is mainly due to relatively high pH in these lakes; at $pH > 8$, total toxic copper is essentially all $Cu(OH)0$ sub 2. Free cupric ion concentrations ($<0.5\%$ total dissolved copper) are also low due to high organic matter concentrations. For all lakes but one, first-order rate constants for total dissolved copper (TDCu) disappearance from water column ranges 0.47-1.01/d and corresponding half-time ranges 1-2 d. The rate constant for the other lake is 0.11/d and corresponding half-time 7 d. This lake differs chemically from the other lakes and is not typical of the area since it is large and has intermittent outflow and sandy sediments. Other lakes are small and shallow, have no permanent inlet or outlet, and have heavy clay sediments. A nearly constant, steady-state concentration is attained in all lakes 10 days after copper sulfate is added. Precipitation of tenorite, malachite and azurite substantially reduces TDCu concentrations. Physical adsorption of copper onto sediments and seston activity also reduce TDCu concentrations. (Danovich-Wisconsin)

EFFECTS OF TWO AROCLOR FRACTIONS ON THE PRODUCTIVITY AND DIVERSITY OF ALGAE FROM TWO LENTIC ECOSYSTEMS,
Wheaton Coll., Norton, MA. Dept. of Biology.
J. C. Kricher, C. L. Bayer, and D. A. Martin.
International Journal of Environmental Studies, Vol 13, No 2, p 159-167, 1979. 10 Tab, 23 Ref.

Descriptors: *Aroclors, *Polychlorinated biphenyls, *Algae, *Water pollution effects, *Stony Brook Pond(MA), *Norton Reservoir(MA), Phytoplankton, Water pollution, Pollutants, Primary productivity, Laboratory tests, Cultures, Speciation, Tracers, Biochemistry, Diatoms, Cyanophyta, Chlorophyta, Lentic envirnment, Growth rates, Massachusetts.

In algal communities in Norton Reservoir and Stony Brook Pond, located 22.5 km apart in southeastern Massachusetts, polychlorinated biphenyl (PCB) Aroclor 1232 is more severe in its effects than Aroclor 1254. During summer 1976, algal communities from these lakes were exposed in laboratory cultures to Aroclor, the only PCB manufactured in the U.S. Both lakes have quite distinct algal communities: Norton Reservoir is characterized by large numbers of Cyanophyceae species whereas Stony Brook Pond is dominated by Bacillariophyceae and Chlorophyceae. Although algal communities are different, both respond similarly to laboratory PCB exposures. Carbon fixation rates following a 24 hr exposure to 1 ppm Aroclor 1232 and 1 ppm 1254 are greatly reduced compared with both untreated and 0.1% acetone controls. Productivity depression is significantly greater in the Aroclor 1232 series than in 1254. Treatment with 100 ppb 1232 also reduces productivity in both ecosystems but not nearly to the degree that 1 ppm does. Lethal PCB effects are inversely related to chlorine content. Algal communities differ in the extent of productivity depression incurred by acetone. Norton 0.1% acetone controls decrease C14 uptake by 23.4% compared with untreated controls whereas only an 11% decrease is observed for Stony Brook. Algal response results from a differential effect of acetone on Cyanophyte physiology. Another difference occurs when Aroclor 1254 at 100 ppb increases C14 uptake compared with acetone controls in Norton cultures, whereas in Stony Brook, ppb 1254 decreases productivity 23% compared with the acetone series. THE RESPONSE OF BENTHIC PLANTS TO PAST LEVELS OF HUMAN USE IN HIGH MOUNTAIN LAKES IN KINGS CANYON NATIONAL PARK, CALIFORNIA, U.S.A.,
California Univ., Berkeley. Dept. of Forestry and Conservation.
T. P. Taylor, and D. C. Erman.
Journal of Environmental Management, Vol 9, No 3, p 271-278, November 1979. 2 Fig, 2 Tab, 30 Ref.

Descriptors: *Kings Canyon National Park(CA), *Nitrates, *Benthic flora, *Recreation wastes, *Water pollution effects, Lakes, Recreation, Iron, Rooted aquatic plants, Alpine, Elevation, Mountains, Recreation demand, Nutrients, Algae, Oligotrophy, Cycling nutrients, Nutrient loading, Macrophytes.

Observations of bottom flora in August 1977 showed that rooted aquatic plants have increased in remote high elevation lakes in Kings Canyon National Park, California. Unrestricted human recreational activities in these lakes during the 1950s and 1960s probably produced large nutrient inputs which are still stimulating present benthic flora growth. Rooted macrophytes (Isoetes, Anacharis, Nitella) as well as bottom algae (Rhizoclonium) cover more of the bottom on lakes with historically higher human use levels. Historic human use contributes nutrients which slowly accumulate in lake sediments. As a result, lakes with more nutrients produce an increased abundance of bottom flora, have lower nitrate concentrations in the water column because of uptake by rooted plants, and have higher total iron concentrations. Mean nitrate concentrations range 0-156 micro g/l with East Kearsarge, Upper Sixty and Upper Rae having high concentrations. Mean total iron concentrations range 4-36 micro g/l with Upper Kear-

sarge having the highest concentration. Mean benthic flora frequencies range 0-100%. Upper Kearsarge, Lower Rae and Bullfrog have high rooted aquatic plant abundance whereas in East Kearsarge and Upper Sixty Lakes, no plants are encountered. East Kearsarge, Lower Sixty and Upper Sixty lakes have low human impact values, while Bullfrog, Charlotte and Lower Rae lakes have exceptionally high values. (Danovich-Wisconsin)

THE UPTAKE OF CHEMICAL ELEMENTS FROM COAL ASH AND SETTLING BASIN EFFLUENT BY PRIMARY PRODUCERS I. RELATIVE CONCENTRATIONS IN PREDOMINANT PLANTS,
Texas Univ. Health Science Center at Houston. School of Public Health.
R. K. Guthrie, and D. S. Cherry.
The Science of the Total Environment, Vol 12, No 3, p 217-222, August 1979. 2 Tab, 15 Ref. AEC AT(38-1)824.

Descriptors: *Rooted aquatic plants, *Chemicals, *Fly ash, *Bioaccumulation, *Savannah River Project(SC), Macrophytes, Biochemistry, Coals, Electric powerplants, Electric power production, Heavy metals, Toxicity, Cattails, Cyanophyta, Water chemistry, Sediments, Water pollution effects, Neutron activation analysis.

Chemical analysis of predominant plants in the ash settling basin drainage system of the Savannah River Project, Aiken, South Carolina, January-December 1974, revealed that the aquatic producers which bioaccumulate chemicals released in coal ash effluents are important and efficient chemical removal mechanisms. Duckweed (Lemna perpusilla) predominates throughout the year; other producers include cattail (Typha latifolia), Pontederia, bald cypress (Taxodium distichum) and algae (Oscillatoria and Hydrodictyon). Mean annual chemical concentrations are highest in sediments and lowest in water for the entire drainage system. Some exceptions are Mn (highest in cattail, 425 ppm), Cl (higher in all plants except Hydrodictyon), Cd (highest in cattail, 1.9 ppm; lowest in cypress, 0.05 ppm), Br (higher in all plants), Sb (highest in Oscillatoria, 2.4 ppm), and Hg (highest in Oscillatoria, 0.9 ppm; lowest in cypress, 0.005 ppm). Of potential macronutrients Fe, Ca, K and Mg, Fe is most highly concentrated by Hydrodictyon and duckweed; Ca by cattail; K by Pontederia and cattail; and Mg by cattail and duckweed. Cu and Zn concentrations are highest in Oscillatoria and lowest in cypress. Cypress leaves accumulate least amounts of the elements measured and do not concentrate any element to the greatest extent. The Savannah River Project power plant burns 451,940 metric tons coal/yr and produces 32,650 metric tons ash which is sluiced into a settling basin by 4.9 billion l water. (Danovich-Wisconsin)

EFFECT OF CYSTEINE AND METHIONINE ON SULFATE UPTAKE AND PRIMARY PRODUCTIVITY BY AXENIC CULTURES AND LAKE MICROPLANKTON COMMUNITIES,
New York State Museum, Albany.
R. H. Monheimer.
Journal of Phycology, Vol 15, No 3, p 284-288, September 1979. 3 Fig, 18 Ref. NSF DEB 76-10591.

Descriptors: *Sulfates, *Kinetics, *Primary productivity, *Phytoplankton, *Organic compounds, *Metabolism, Algae, Anabaena, Nannoplankton, Sulfur, Navicula, Ankistrodesmus, Speciation, Cultures, Biological communities, Water pollution effects, On-site tests, Lake George(NY), Tracers, Canadarago Lake(NY), Plant physiology, New York.

Culture and in-situ experiments (April-October 1976) examining effects of organic sulfur (S) on sulfate uptake by algae and naturally occurring microplankton communities concluded that algal sulfate uptake and primary productivity will probably not be influenced by dissolved organic matter additions to waters. In most fresh water systems, organic S pollution effects on algal sulfate uptake and primary productivity are insignificant when compared to other ecological changes which overshadow any such effects. Equimolar mixtures of cysteine and methionine (organic S) in 500 microg S/1 concentrations have no effects on Navicula pelliculosa sulfate uptake rates. However, this mixture decreases sulfate uptake rates of Ankistrodesmus falcatus; uptake rates of Anabaena flos-aquae are decreased by 50 microg organic S/1. In these axenic cultures, primary productivity also decreases in A. falcatus. In situ isotope uptake experiments took place in oligotrophic Lake George and eutrophic Canadarago Lake, New York. Effects of organic S additions on sulfate uptake and primary productivity are in basic agreement with, but less pronounced than, parallel effects on algal cultures. Sulfate uptake rates, relative to primary productivity, are higher when diatoms and blue-green algae are present; and lower when green algae are present. Additions of cysteine/methionine mixtures to lake waters decrease microplankton sulfate uptake rates in correlation with algal community composition. Primary productivity decreases upon cysteine/methionine additions when green algae are relatively abundant. (Danovich-Wisconsin)

LAKE ECOSYSTEMS: A POLYHEDRAL DYNAMICS REPRESENTATION,
New York Univ., NY. Dept. of Computer Applications and Information Systems.
J. Casti, J. Kempf, L. Duckstein, and M. Fogel.
Ecological Modelling, Vol 7, No 3, p 223-237, September 1979. 3 Fig, 4 Tab, 13 Ref. NSF ENG 76 20280.

Descriptors: *Polyhedral dynamics, *Lakes, *Methodology, *Eutrophication, Systems analysis, Water quality, Nutrients, Light, Phytoplankton, Zooplankton, Model studies, Q-analysis, Food chains, Ecosystems, Dynamics, Fish, Productivity, Graphical analysis, Equations.

Polyhedral dynamics, a type of systems methodology based on topology, is presented as a technique for modeling the global structure and dynamic behavior of water quality problems in the aquatic ecosystem. The lake ecosystem, composed of organic and inorganic nutrients, light, phytoplankton, zooplankton, and fish is presented as a multidimensional graph using a technique called Q-analysis. Then a flow pattern is superimposed upon the Q-analysis to describe the dynamic behavior of the system. The utility of the method is demonstrated by looking at the effects of eutrophication. Q-analysis results correlate well with the traditional concept of a food chain. Also, the dynamic changes in the ecosystem caused by nutrient addition are seen to be a result of limits on matter and energy flow through the ecosystem imposed by the structure as it is defined by the Q and obstruction vectors. This insight can not be easily reached by traditional differential equation representations. Consideration of the dynamic behavior gives a quantitative basis to the qualitative changes which an ecosystem undergoes as a result of increased nutrient loading. Thus the approach may be used to assess the effectiveness of alternative eutrophication control methods. However, the nonlinear nature of the pattern defined by the analysis makes a more quantitative analysis difficult. (Luedtke-Wisconsin)

SEASONAL DISTRIBUTION AND ABUNDANCE OF MARINE BIRDS IN ALASKA,
Fish and Wildlife Service, Anchorage, AK. Office of Biological Services and Coastal Ecosystems.
C. J. Lensink, and P. J. Gould.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol II, Receptors--Birds, p 1-6, October 1979. 19 Ref, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Birds, *Data collections, Resources development, Alaska, Seasons, Environmental effects, Water pollution effects, Baseline studies, *Outer Continental Shelf, Petroleum development, Seasonal distribution, Gulf of Alaska, Bering Sea, Beaufort Sea, Chukchi Sea.

Over 10,000 transects have been completed which equates to over 100,000 computer cards or over 1,000,000 pieces of information. This data base contains information derived from shipboard and aerial surveys of birds in all of Alaska's marine habitats. The greatest bulk of data is from the Gulf of Alaska, particularly in the Kodiak region. A substantial amount of data from the Bering Sea and a small amount from the Chukchi and Beaufort Seas is also present. Information on the distribution and abundance of marine birds over the outer continental shelf of Alaska is critical for the establishment of methods for preventing or mitigating impacts associated with the development of petroleum reserves. Descriptors: *Birds, *Breeding, *Food habits, *Ecology, Environmental effects, Resources development, Water resources, Aircraft, Baseline studies, Alaska, *Outer Continental Shelf, Gulf of Alaska, Petroleum development, Disturbances, Noise pollution, Pelagig birds.

A study of seabird colonies on Chisik and Duck Islands comprising the Tuxedni Wilderness in lower Cook Inlet is reported. Productivity statistics concerning black-legged kittiwakes and horned puffins are compiled through their incubation and nestling stages to fledgling. Observations of common murres and glaucous-winged gulls are recorded on a more incidental base. The gulls emerged as an important predator of kittiwakes and murres. The kittiwakes (a surface feeder) failed in the reproductive effort, while the puffins (a diver) achieved success. Both of these species fed on Pacific sand lance, puffins exclusively and kittiwakes nearly so. It is believed kittiwakes failed because this fish did not enter surface wates in substantial numbers, but puffins found them in deeper layers. The kittiwakes have failed in three of four known breeding attempts, which argues a need to continue the studies and to study the fish. Airplanes, particularly helicopters on OCS related activities, create disturbances that expose kittiwake eggs and nestlings to predation by overabundant glaucous-winged gulls. (Sinha-OEIS)

NEARSHORE FEEDING ECOLOGY OF MARINE BIRDS IN THE KODIAK AREA, 1978,
Fish and Wildlife Service, Anchorage, AK. Office of Biological Services and Coastal Ecosystems.
L. D. Krasnow, G. A. Sanger, and D. W. Wiswar.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol II, Receptors--Birds, p 348-394, October 1979. 16 Fig, 4 Tab, 22 Ref, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-01-5-022-2538.

Descriptors: *Birds, *Food habits, *Ecology, *Water pollution effects, Environmental effects, Resources development, Baseline studies, Food chains, Oil spills, Alaska, *Outer Continental Shelf, Kodiak Island, Gulf of Alaska, Petroleum development.

A study of the feeding habits of marine birds in the nearshore waters of the Kodiak Island area was undertaken in order to evaluate the possible impact of OCS activities on their feeding ecology. A total of 58 oldsquaw, black scoters, common murres and marbled murrelets were collected in Chiniak Bay between 23 and 25 February 1978. Their stomachs were examined and aggregate percent volume was calculated for each type of prey. Seabird collections were made between 2 April and 30 August 1978, in the Kodiak area. A total of 555 black-legged kittiwakes, tufted puffins, common murres, sooty and short-tailed shearwaters, marbled murrelets and pigeon guillemots was collected. Of these, 323 (58%) had digestible prey tissue in their stomachs. Offshore Continental Shelf activities which endanger the productivity of benthic invertebrate or epipelagic euphausiid and fish populations could have a significant negative impact on the feeding ecology of marine birds. Most of the seabirds studied are primarily piscivorous, consuming almost entirely capelin, sand lance, pollock and Pacific sandfish during the breeding season. Those which have more diverse diets (pigeon guillemots and wintering oldsquaw and black scoters) are dependent on sessile or slowly moving benthic forms which may be unable to avoid contact with contaminated water. (Sinha-OEIS)

Descriptors: *Birds, *Ecology, *Food chains, *Breeding, Monitoring, Baseline studies, Water pollution effects, Environmental effects, Resources development, Alaska, *Outer Continental Shelf, Petroleum development, Alaska Peninsula.

This study of marine birds in the Shumagin Islands was one of several site specific studies of birds. The general purpose of the studies was to obtain information on birds necessary to evaluate the potential impacts of the proposed development of petroleum resources of the outer continental shelf and to provide baseline data for monitoring the effects of the development program. The Shumagin Islands were chosen as a study site because of the presence of large, diverse populations of marine birds that could be adversely affected by development in the Kodiak Basin or by tanker traffic from development areas in the Bering, Chukchi, or Beaufort Seas. In addition, the presence of large populations of small alcids was of interest because species in this group are highly vulnerable to marine pollution and were not adequately represented at other study areas. A notable feature of the colony distribution in the Koniuji Group is the concentration of breeding seabirds at the northern end of Big Koniuji and in the Koniuji Strait - Yukon Harbor area at the island's southeastern end. At each of these localities strong winds and tidal rips are prevalent, which are important mechanisms of nutrient-mixing in this greater availability of nutrients, support a large standing crop of euphisiids, which in turn support large seabird populations. (Sinha-OEIS)

DISTRIBUTION, ABUNDANCE, COMMUNITY STRUCTURE AND TROPHIC RELATIONSHIPS OF THE NEARSHORE BENTHOS OF COOK INLET AND NEGOA,
Alaska Univ., Fairbanks. Inst. of Marine Science.
H. M. Feder, and A. J. Paul.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol III, Receptors--Fish, Littoral, Benthos, p 1-30, October 1979. 44 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-03-5-022-56.

Descriptors: *Benthos, *Baseline studies, *Fisheries, *Water pollution effects, Oil spills, Clams, Crabs, Shrimp, Environmental effects, Resources development, Alaska, *Outer Continental Shelf, Gulf of Alaska, Cook Inlet, Petroleum development.

The long-term objectives of this study are: (1) a qualitative and quantitative inventory of benthic species within and adjacent to identified oil-lease sites in the northeast Gulf of Alaska (NEGOA) and lower Cook Inlet, (2) a description of spatial distribution patterns of selected species in the designated study areas, and (3) observations of biological interrelationships, specifically trophic interactions, between components of the benthic biota in designated study areas. Forty-two widely dispersed permanent stations for quantitative grab sampling have been established and these stations represent a reasonable nucleus around which a monitoring program can be developed. Infaunal invertebrates taken by van Veen grab in the northeast Gulf of Alaska have been used to comprehend station/species aggregations by cluster analysis. Preliminary groupings of stations into three basic clusters have been accomplished. The operations connected with oil exploration, production, and transportation in the Gulf of Alaska present a wide spectrum of potential dangers to the marine environment. Adverse effects on the marine environment of these areas cannot be quantitatively assessed, or even predicted, unless background data are recorded prior to industrial development. (Sinha-OEIS)

KEY ORGANISMS IN BENTHIC FOOD WEBS AND THEIR RELATIONSHIP TO IMPORTANT HABITATS IN LOWER COOK INLET,
Alaska Univ., Fairbanks. Inst. of Marine Science.
H. M. Feder, and A. J. Paul.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol III, Receptors--Fish, Littoral, Benthos, p 31-83, October 1979. 4 Fig, 17 Tab, 42 Ref, Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-03-5-022-56.

Descriptors: *Benthos, *Habitat, *Food webs, *Ecosystems, Water pollution effects, Monitoring, Baseline studies, Environmental effects, Oil pollution, Resources development, Crabs, Shrimps, Fisheries, Fish, Alaska, *Outer Continental Shelf, Gulf of Alaska, Petroleum development.

The snow crab (Chionoecetes bairdi) is a conspicuous member of the shallow shelf of lower Cook Inlet, and supports a commercial fishery of considerable importance. Food data for snow crab, king crab (Paralithodes camtschatica), Dungeness crab (Cancer magister), 9 species of shrimps, and 19 species of fishes are now available. The importance of deposit-feeding clams in the diet of king and snow crabs, and some bottom fishes is clear. It is suggested that comprehension of the relationship between oil, sediment, deposit-feeding clams, king and snow crabs is essential to understand the potential impact of oil on the latter two commercially important species. Initial assessment of all data suggests that sufficient station uniqueness exists to permit development of monitoring programs based on species composition at selected stations utilizing grab, dredge, and trawl sampling techniques; and adequate numbers of biologically well-known, unique, and/or large species are available to permit nomination of likely monitoring candidates once industrial activity is initiated. Benthic invertebrates (primarily the infauna, and slow-moving epifauna) are useful as indicator species for a disturbed area because they tend to remain in place, typically react to long-range environmental changes and, by their presence, generally reflect the nature of the sub-stratum. Descriptors: *Benthos, *Food webs, *Ecosystems, Water pollution effects, Baseline studies, Monitoring, Environmental effects, Oil pollution, Resources development, Crabs, Shrimps, Fisheries, Alaska, *Outer Continental Shelf, Kodiak Shelf, Petroleum development.

Until recently little was known about the biology of the invertebrates of the shallow, nearshore benthos of Kodiak Island. Since these invertebrates may be the ones most affected by petroleum operations in waters adjacent to Kodiak Island, baseline data on these species are essential before industrial activities begin there. The objective of this study was to assess distribution and relative abundance of epifaunal invertebrates in selected bays and offshore areas; and to determine the feeding habits of the principal inshore epifaunal invertebrate species, emphasizing king crabs, and selected bottom fishes. Thirty-nine permanent benthic stations were established in two bays - 25 stations in Izhut Bay and 14

stations in Kiliuda Bay. Initial assessment of data suggests that a few unique, abundand and/or large invertebrate species (king crab, snow crab, several species of clams) are characteristic of the bays investigated and that these species may represent organisms that could be useful for monitoring purposes. It is also suggested that a complete understanding of the benthic systems of Kodiak waters can only be obtained when the infauna is also assessed in conjunction with the epifauna. Based on stomach analyses, infaunal species are important food items for king and snow crabs. (Sinha-OEIS)

ENVIRONMENTAL ASSESSMENT OF SELECTED HABITATS IN THE BEAUFORT AND CHUKCHI LITTORAL SYSTEM,
Western Washington Univ., Bellingham.
A. C. Broad, A. Benedict, K. Dunton, H. Koch, and D. T. Mason.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol III, Receptors--Fish, Littoral, Benthos, p 361-542, October 1979. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-03-5-022-81.

Descriptors: *Littoral, *Benthos, *Ecosystems, *Food webs, *Carbon, Water pollution effects, Environmental effects, Baseline studies, Oil pollution, Resources development, Alaska, *Outer Continental Shelf, Beaufort Sea, Chukchi Sea, Petroleum development.

Except for the Stefansson Sound Boulder Patch, there is no known unique or unusual benthic habitat in the Beaufort, inshore or nearshore regions. The Stefansson Sound region is a biological habitat that, for practical purposes, may be considered unique and, at least until this community and its overall contribution to the Beaufort Sea are better known than now is the case, should not be disturbed. Carbon from detritus of terrestrial origin enters the Beaufort marine food web through Gammarus setosus and, possibly other species. The full importance of this contribution is yet to be evaluated, but there are implications for attempts at shoreline stabilization and, interference with currents that transport materials alongshore. Data indicate a relationship between the presence of peat and the abundance of benthos. Because development which may require shoreline stabilization and interference with longshore transport are imminent and because this same development may introduce into the marine environment materials that can affect the availability of detrital carbon to the marine biota, it is important that the extent of this contribution and the pathways by which it occurs are known at the earliest possible date. NUTRIENTS DYNAMICS IN NEARSHORE ALASKAN BEAUFORT SEA WATERS,
Alaska Univ., Fairbanks. Inst. of Water Resources.
D. M. Schell.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol V, Receptors--Microbiology, Contaminant Baselines, p 143-190, October 1979. 9 Fig, 5 Tab, 18 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-3-5-022-56.

Descriptors: *Productivity, *Aquatic life, *Carbon, *Nutrients, *Erosion, Environmental effects, Baseline studies, Water pollution effects, Oil pollution, Alaska, Resources development, *Outer Continental Shelf, Beaufort Sea, Nutrient cycles, Petroleum development.

The principal processes supplying energy (i.e. fixed carbon) to the biota of the Beaufort Sea coastal zone is described and related to the various nutrient chemistry regimes observed to this production of energy. The conclusions to date give evidence that the nearshore Beaufort Sea is decidedly different than more temperate Alaskan coastal zones with regard to the energy sources supporting the biota. The estimates of energy input to nearshore waters show that over 50% of the carbon input to nearshore marine biota (within approximately 10 km of shore) is terrestrially derived from two primary processes, fluvial transport and coastline erosion. The rivers carry large quantities of organic matter during spring break-up and coastal erosion occurs during summer months, resulting in the deposition of large amounts of organic carbon along the shoreline. This carbon is composed primarily of peat-like material that has been accumulating on land for up to 12,000 years. Thus the nearshore marine biome is apparently a 'fossil fuel' subsidized ecosystem wherein the meager annual primary production by ice algae and phytoplankton is supplemented by organic carbon eroded from coastal peat bluffs and transported by river flow into the coastal zone. The implications of oil and gas development are mostly indirect but potentially great. Development that would increase or decrease shoreline erosion or runoff characteristics could be expected to show corresponding impacts on the nearshore zone. (Sinha-OEIS)

COMPOSITION, TRANSPORT AND DEPOSITION OF SUSPENDED MATTER IN LOWER COOK INLET AND SHELIKOF STRAIT, ALASKA,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
R. A. Feely, J. D. Cline, G. Massoth, A. J. Paulson, and M. F. Lamb.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol V, Receptors--Microbiology, Contaminant Baselines, p 195-263, October 1979. 24 Fig, 8 Tab, 36 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Suspended solids, *Circulation, *Oil pollution, *Water pollution effects, Heavy metals, Trace elements, Baseline studies, Resources development, Alaska, *Outer Continental Shelf, Gulf of Alaska, Petroleum development, Crude oil.

Of particular concern are the major accidents which cause massive oil spills, however, chronic release of oil through minor spills and localized transfer operations may be more important over the long term. Since crude oil is sparingly soluble in seawater, it tends to form emulsions when introduced into marine waters, especially under intense wave action. The emulsions have a high affinity for particles and tend to be adsorbed rapidly. Recent studies of oil spills in coastal waters containing high suspended loads have indicated rapid dispersal and removal of the oil by sorption onto particles along frontal zones. These zones are regions where turbid brackish water contacts seawater. The seasonal distributions, elemental composition, and fluxes of suspended particulate matter in lower Cook Inlet were studied and compared with current patterns and bottom sediment distributions. In general, the suspended matter distributions appear to follow the pattern of circulation in lower Cook Inlet and Shelikof Strait. The inflowing clear saline Gulf of Alaska water, which is enriched in biogenic particles of marine origin, flows northward along the eastern coast until it reaches the region near Cape Ninilchik where it mixes with the outflowing brackish water. Comparison of suspended matter and sediment characteristics as well as regional sedimentation rates indicates that net sedimentation of suspended matter in the central basin of lower Cook Inlet is minimal. However, net sedimentation is occurring in the embayments along the coast. (Sinha-OEIS)

NATURAL DISTRIBUTION AND ENVIRONMENTAL BACKGROUND OF TRACE HEAVY METALS IN ALASKAN SHELF AND ESTUARINE AREAS,
Battelle-Northwest Labs., Richland, WA.
D. E. Robertson, and K. H. Abel.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol V, Receptors--Microbiology, Contaminant Baselines, p 660-696, October 1979. 8 Fig, 13 Tab. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Heavy metals, *Sediments, *Baseline studies, Water pollution effects, Resources development, Environmental effects, Estuaries, Manganese, Vanadium, Alaska, *Outer Continental Shelf, Petroleum development.

The projected recovery of crude oil from the Alaskan continental shelves carries with it the risk of altering this environment by physical perturbations or spillage of crude oil. Such disturbances could result in detrimental impacts on the natural cycling of trace heavy metals in the shelf environment. It is therefore necessary to determine predevelopment evaluations of the trace metal distributions and behavior in promising shelf areas so that any future contamination may be identified, quantified and assessed. The primary objective of this study was to determine environmental baseline concentrations of selected heavy metals in seawater (both dissolved and suspended fractions), in sediments, and in selected marine 'indicator organisms' of the Alaskan study area. The work reported for this period centers around the analyses of samples collected in Cook Inlet during participation in two field cruises on May 4-15, 1978 and August 25-September 5, 1978. The results of analyses of sediments from the Beaufort Sea, Chukchi Sea, Norton Sound and the Shelikof Strait are also reported as well as the analyses of vanadium in biota from various shelf areas. 5D. Waste Treatment Processes

THE APPLICATION OF PHYSICAL AND CHEMICAL PARAMETERS TO THE DESIGN OF RAISED BED SOIL ABSORPTION SYSTEMS,
J. R. Smyth, and J. D. Lowry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182033, Price codes: A06 in paper copy, A01 in microfiche. Maine Land and Water Resources Center University of Maine, Orono Project Completion Report, April 1980. 108 p, 12 Fig, 3 Tab, 115 Ref. OWRT A-040-ME(5).

Descriptors: *Sewage treatment, *Septic tanks, *Maine, *Optimization, Biochemical oxygen demand, Nitrogen, Pathogenic bacteria, Soil properties, Phosphorus, Oxidation-reduction potential, Denitrification, Absorption, Permeability, Domestic wastes.

The physical and chemical relationships involved in waste water treatment by raised bed soil absorption systems were quantified and improved design criteria for the treatment of nitrogen, phosphorus, organic carbon, and bacteria and viruses were developed. Study conditions were tailored to those found in Maine where approximately 50% of households are not linked to municipal sewage systems and as little as 15% of the land can accommodate conventional soil absorption systems. For each of the study pollutants, ammonium-nitrogen, nitrate-nitrogen, phosphorus, organic carbon, and bacteria and viruses, transport and retention in soils was investigated and these results were combined with field results from two systems in Maine to design optimum systems for each pollutant. Waste water production was estimated at 189 liters/capita/day for design purposes. Parameters considered for each design included pH, moisture content, temperature, redox potential, loading rate, soil texture, and soil composition. Results show that the only long term treatment for the removal of nitrogen is nitrification followed by denitrification. It is difficult to achieve substantial denitrification in a raised bed system but a nitrification/denitrification system is proposed. Chemical adsorption and precipitation were found to effectively remove phosphorus in raised bed systems. While all of the optimum designs are not compatible, a mutually satisfactory raised bed design is possible. (Seigler-IPA)

PROCEEDINGS OF A WORKSHOP ON ALTERNATIVE WASTEWATER TREATMENT SYSTEMS AT URBANA-CHAMPAIGN, ILLINOIS, JUNE 12-13, 1979.
Water Resources Center University of Illinois at Urbana Special Report No 10, August 1979. 150 p. 40.038, 79/20.

Descriptors: *Waste water treatment, *Conferences, *Illinois, *Alternative waste-water treatment, *Innovative treatment, *On-site management districts, *On-site treatment systems, *Wastewater disposal, 1977 Clean Water Act, Clustered treatment systems, Consulting engineers, Cost-benefit analysis, Treatment facilities, Funding, Land application-sludge, Land application-wastewater, California, Pressure sewers, Sewage disposal, Public participation-Illinois, Septic tanks, Wastewater Disposal Zone Act-Illinois.

The purpose of the workshop was to instruct consultants, local officials, and state agency personnel in the state of the art of alternative wastewater-treatment systems, including funding and institutional aspects. The workshop consisted of presentations by speakers from governmental agencies, universities, and consulting firms on the design of alternative systems, cost effectiveness, and the state and federal laws that apply. The workshop was divided into three parts: Policy and Regulations, Alternative and Innovative Systems, and Institutional Aspects.

THE UTILIZATION OF A FRESH-WATER WETLAND FOR NUTRIENT REMOVAL FROM SECONDARILY TREATED WASTE WATER EFFLUENT,
Michigan Univ. Ann Arbor. Dept. of Chemical Engineering.
D. L. Tilton, and R. H. Kadlec.
Journal of Environmental Quality, Vol 8, No 3, p 328-334, July-September 1979. 9 Fig, 6 Tab, 20 Ref. NSF AEN 75-08855.

Descriptors: *Nutrient removal, Plant growth, *Wastewater treatment, *Wetlands, *Houghton Lake(MI), Nitrogen, Nitrates, Nitrites, Phosphorus, Hydrology, Waste disposal, Sewage treatment, Sewage disposal, Waste dilution, Waste assimilative capacity, Effluents, Ammonia, Cattails, Discharge(Water).

Secondarily treated waste water applied to a freshwater wetland southwest of Houghton Lake, Michigan 1976-1977, showed that this wetland system was highly efficient in reducing dissolved nutrients. Although long-term vegetation changes are difficult to predict, annual effluent discharges into Houghton Lake wetland will probably favor plant species associated with wetter and more nutrient-rich conditions. Between May and September 1976, effluents were discharged with outlets every 9 m over a 200 m distance. Mean flow rate was 15.8 cu m/d; water depths were 12 cm at the pipeline. Prior to pumping, nitrate and nitrite concentrations were <0.01 mg/l at 25 m from the pipeline and remained at this level during discharge. Nitrogen averaged 0.36 mg/l in the effluent. Ammonium concentrations in the treated waste water were rarely greater than concentrations in wetland surface waters. Total dissolved phosphorus (TDP) concentrations averaged 0.01 mg/l prior to discharges. TDP averaged 0.41 mg/l in the effluent and 0.11 mg/l at sampling stations 25 m from the discharge. In 1977 a point-source distribution system was used. Effluent concentrations averaged 1.50 mg nitrate/l and 1.57 mg TDP/l. Within 30 m nitrate was 0.10 mg/l and within 80 m TDP was 0.07 mg/l in surface waters. Biomass, including live plants, standing dead plants and litter was not significantly different among sampling stations. However, Typa (cattail) dimensions were larger in the discharge area; maximum leaf length was 170 cm within 6 m of the pipeline compared to 145 cm 50 m from the discharge. (Danovich-Wisconsin)

5E. Ultimate Disposal Of Wastes

DEVELOPMENT OF ANIMAL WASTE FACILITIES FOR MINIMIZING WATER POLLUTION,
South Dakota State Univ., Brookings. Water Resources Inst.
J. L. Wiersma.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-181357, Price codes: A04 in paper copy, A01 in microfiche. Project Completion Report, March 1980. 68 p, 33 Fig, 5 Tab. OWRT A-036-SDAK(1).

Descriptors: *Feed lots, *Cattle, *Farm wastes, *Water pollution sources, Terracing, Agricultural runoff, Farm management, Feeds, Livestock, Decomposing organic matter, Water pollution, Groundwater, Confinement pens, South Dakota, Fertilization.

Three methods for controlling water pollution from animal wastes in feedlots are presented. The first method involves confining all wastes and water to the feedlot area until maximum decomposition occurs. A feedlot was designed to completely eliminate runoff and percolation thus creating a solids-liquid ratio on the surface to promote rapid decomposition. The lot had a dish shaped porous surface on a sand bed with imbedded collector drains. Perforated steel matting was used for the surface. This original design did not work well as cattle wastes and hair formed a nearly impermeable layer on the sand. The use of the sand filter was abandoned but the use of the perforated steel matting proved positive. The second method involved the use of a minimum area for the feedlot to favor decomposition and treatment of wastes. A system of diversion ditches and drying terraces was used to handle runoff and wastes from a sloped lot. Sample wells were used to study groundwater flow and quality near the terraces. General groundwater quality in the vicinity of the terraces was poor, however, results indicate that the drying terraces were not the cause of the poor quality. The third method involves the return of feedlot wastes to the land at a rate that does not inhibit full crop production. Factors that must be considered include climate, wastes, soils, crops, rotations, manure nitrogen content, and cattle feed type. Due to the lack of sufficient funding only preliminary results and conclusions were made for this method. (Seigler-IPA)

5F. Water Treatment and Quality Alteration

THE SELECTIVE REMOVAL OF NITRATE AND NITRITE FROM POLLUTED WATERS,
Kansas State Univ., Manhattan. Dept. of Chemistry.
W. C. Danen, and C. E. Meloan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180771, Price codes: A02 in paper copy, A01 in microfiche. Kansas State University Project Completion Report, April 1, 1980. Kansas Water Resources Research Institute. 19 p, 8 Tab, 18 Ref. OWRT A-079-KAN(1), 14-34-0001-8018.

Descriptors: *Nutrient removal, Methodology, *Nitrates, *Nitrites, Pollution, Ion-selective polymers, Water, Polyvinylbenzyl chloride, Nitron, Polyvinylbenzylnitron chloride, *Insoluble polymers, Toxicity, Methemoglobinemia, Ion-exchange polymer, Polymer-supported reagents.

The objective of the research project was to synthesize an insoluble polymer to remove nitrate and nitrite from water. A high capacity nitrate- and nitrite- selective polymer was synthesized by attaching nitron to commercial polyvinylbenzyl chloride (60/40 ortho/para isomers). The capacity of this polymer to remove nitrate and nitrite from 10 to the minus third power M solution was 67% and 42%, respectively. The compound 1-phenyl-2-diethylaminoethyl-4'-aminobenzoate was also synthesized and attached to commercial polyvinylbenzyl chloride (60/40 ortho/para isomers). The nitrate and nitrite selectivity of this polymer was realized and the capacity of this polymer to remove nitrate and nitrite from aqueous solution was 76% and 65.6%, respectively. 2-Diethylaminoethyl-4'-nitrobenzoate hydrochloride was synthesized but exhibited no tendency to complex/precipitate nitrate. Two other compounds, 1-(4'-nitrophenyl)-2-diethylaminoethyl-4''-nitrobenzoate hydrochloride and 1-(4'-aminophenyl)-2-diethylaminoethyl'4''-aminobenzoate hydrochloride, were synthesized and their abilities to precipitate nitrate from aqueous solution were compared to that of the nonsubstituted ester; the nitro-substituted compound was shown to be most efficient. Thus, a polymer was synthesized by attachment of 1-(4'-nitrophenyl)-2-diethylaminoethyl-4''-hydroxybenzoate to polyvinylbenzyl chloride (60/40 ortho/para isomers). The capacity of this polymer to remove nitrate and nitrite from aqueous solution was 80% and 68%, respectively. All of the synthesized polymers could be easily regenerated without loss of capacity and used repeatedly providing a possibility for commercial development.

SMYRNA, DELAWARE SOLVES A WATER PROBLEM,
Delaware Div. of Public Health, Dover. Office of Water Supply.
M. Joyce.
Water and Sewage Works, Vol 127, No 3, p 32, 42, March, 1980. 1 Tab, 13 Ref.

Descriptors: *Ground water, *Municipal water, *Water pollution treatment, *Aeration, Delaware, Water supply, Activated carbon, Organic wastes, Carcinogens.

A U.S. EPA organics monitoring survey detected trichloroethylene (TCE) in the municipal water system of Smyrna, Delaware. The town issued a public notice which recommended that all water used for drinking or cooking be boiled. Also, plans were made to either tap another aquifer or treat and monitor the contaminated aquifer. Since the contaminated levels were not abating and the source remained undetermined, it was decided to use TCE-removal techniques for the existing system. Granular activated carbon (GAC) was excluded due to its high cost. Aeration was used successfully to remove TCE. (Purdin-NWWA)

A RATIONAL APPROACH TO UTILIZATION OF CARBON BEDS IN REDUCING MICROORGANIC CONTAMINATION IN DRINKING WATER,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
F. A. DiGiano, W. H. Frye, and C. W. Baxter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182789, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Research Center, University of Massachusetts Publication No 109, 1980. 113 p, 42 Fig, 12 Tab, 39 Ref, 2 Append. OWRT A-091-MASS(1), 14-34-0001-6022.

Descriptors: *Activated carbon, *Water treatment, *Potable water, *Adsorption, *Fixed bed adsorbers, *Organic contaminants, *Drinking water treatment, Competition, Kinetics, Multi-component adsorption, Ideal adsorbed solution theory, Adsorption models, Methodology.

In the near future, granular activated carbon (GAC) adsorption beds will become more frequently used in water treatment for control of specific organic contaminants of concern to public health, e.g., the trihalomethanes and other low molecular weight chlorinated compounds. The problem of predicting GAC performance when a complex mixture of trace organics is present has not been solved. This research examined the anomalous, competitive adsorption of a specific organic compound, o-cresol, in the presence of acetophenone and in the presence of acetophenone and veratrole. Several competitive equilibrium models were used to no avail in explaining the reversal of expected preference for adsorption sites. The importance of considering adsorption rate in addition to adsorption equilibrium was demonstrated. The o-cresol adsorbed much more slowly than the other components, even though they all have very similar molecular diffusivities. Apparently, the form of the adsorbing species, solid vis-a-vis liquid, influenced adsorption kinetics. A small differential carbon contactor was demonstrated to provide a convenient means of screening the breakthrough behavior of mixtures of organic compounds. This rapid data gathering technique could be used in lieu of, or in addition to, mathematical models, especially when anomalous behavior is suspected. (Godfrey-Mass)

SELF-PURIFICATION OF RIVERS A TWO-PHASE MODEL FOR BACTERIAL BIODEGRADATION,
Centre Belge d'Etude et de Documentation des Eaux, Liege.
F. Edeline, and G. Lambert.
Water Research, Vol 13, No 6, p 473-480, 1979. 8 Fig, 20 Ref.

Descriptors: *Bacteria, *Self-purification, *Rivers, *Biodegradation, *Mathematical models, *Substrates, *Kinetics, Oxygen, Equations, Population dynamics, Monod equation, Oxygen sag, Chemical oxygen demand, Metabolism, Michaelis-Menten equations, Theoretical analysis, Waste assimilative capacity, Water pollution, Water pollution control.

A simple two-phase model accounts for 95% of total oxygen consumption during the bacterial phase of river self-purification. The two phases are characterized by a logistic model: phase one corresponds to a destruction of most substrate and formation of cellular reserves; phase two consumes these stored substances when external substrate is less attractive than endogenous reserves. The model is theoretically based on several well-established laws; it is restricted to the truly bacterial process, starting when pollutants are added and ending at the plateau value. Monod equations are used for bacterial dynamics. Validity of these theoretical equations is checked by oxygen sag curves. The total metabolized substrate is given by the difference between initial COD and plateau COD values. Five typical results are obtained with municipal sewage as substrate and river water as seeding. Biological zero is obtained after 31.5 h, irrespective of pollutant load. During the second phase as external substrates decrease and internal substrates increase, an equilibrium point occurs where both are equally available to cells. Experimental results show that the kinetic constant for external substrate metabolization is extremely sensitive to toxic or inhibitory influences and varies widely. The kinetic constant for endogenous respiration is fairly constant at 0.30-0.35. The proportion of external substrate converted into stored substances is not truly a constant but varies between narrow limits centered around 15%. (Danovich-Wisconsin)

SETTLEABILITY OF URBAN RUNOFF POLLUTION,
Rutgers - The State Univ., New Brunswick, N. J. Water Resources Research Inst.
W. Whipple, Jr., and J. V. Hunter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182017, Price codes: A02 in paper copy, A01 in microfiche. Partial Completion Report, April 1980, 19 p, 10 Fig, 12 Ref. OWRT A-058-NJ(1), 14-34-0001-0132.

Descriptors: *Water pollution control, Water pollution, Pollution, Heavy metals, Oil pollution, Organic wastes, *Storm runoff, Coliforms, *Sediment control, Sediment, *Detention reservoirs, Storm water, *Settling basins, Urban runoff, *Storm water management, Dual purpose detention basins, *Settleability of pollutants.

Because of the growing interest in stormwater management, and particularly of the possibility of using detention basins for removing particulate pollution, it is important to determine the effectiveness of such basins for removal of various polluting substances. In the study reported upon, samples of urban runoff were allowed to settle in a large tube, and the quantity of each pollutant settling in a given time period determined. There was more variability in rate of settlement of specific pollutants than for total suspended solids. Lead and hydrocarbons settled out 60-65% in 32 hours, only slightly slower than total suspended solids. BOD and copper were removed at somewhat lower rates, and zinc even lower. Coliform counts were reduced by an order of magnitude. These results indicate the probable effectiveness of retention of stormwaters in removing particulate pollutants. The use of dual prupose detention basins, required to be built by developers as a condition of developing the land, is the only feasible means which has been found to prevent further increases in nonpoint source pollution in urbanizing areas. These concepts are now being applied in municipalities, counties and substate regional agencies.

SHIFTING EMPHASIS TO GROUND WATER,
Water Pollution Control Federation, Washington, DC.
P. J. Piecuch.
Journal Water Pollution Control Federation, Vol 52, No 3, p 441, March, 1980.

Descriptors: *Water pollution control, *Ground water, Regulations, Waste water treatment, Waste water disposal, Surface water, Water quality, Potable water.

The EPA is shifting its emphasis on water quality activities from surface water to ground water. This is due to the fact that 50% of urban residents and 95% of rural residents rely on ground water for potable purposes, and ground water supplies are 50 times greater than annual surface water flows in the U.S. Existing data on ground water quality are inadequate in the face of potential threats from pollution sources. As part of the EPA's National Ground Water Strategy, task groups have been formed, workshops have been set, strategy papers

will be published, and public hearings will be held. This change of emphasis is likely to cut across a wide range of regulatory programs and involve a shift from corrective measures such as effluent treatment to preventive measures, which is probably the only way to attack the ground water problem. NEW NATIONWIDE HYDROLOGIC INVESTIGATIONS.
Ground Water Age, Vol 14, No 7, p 21-24, 40, 42, March, 1980. 1 Fig.

Descriptors: *Regional analysis, *Ground water resources, *Investigations, Hydrologic data, Aquifer systems, Aquifer management, Planning, Withdrawal, Computer models, Water quality, Forecasting, Economics.

Large supplies of ground water will be required in the coming decade for municipal, agricultural and industrial supplies. This may result in lowering ground water levels, degradation of water quality, and land subsidence. The understanding of the natural flow system and of the way in which it will respond-hydraulically, chemically, and structurally-to imposed stresses, is a necessary prerequisite to groung water development planning. To provide information on a regional scale, the U.S. Geological Survey has initiated a new series of hydrologic investigations--The Regional Aquifer System Analysis (RASA) Program. This program represents a systematic effort to study twenty-nine regional aquifers which cover much of the country and represent most of the national water supply. For interconnected aquifers, the study objective will be to define the regional hydrology and establish a framework-geologic, hydraulic, and geochemical-for detailed local studies. For systems composed of independent aquifers, the study objective will be to establish common principles governing the occurrence, movement and quality of ground water in the individual units. Every project will use computer models to analyze existing hydrologic regimes and provide predictive capabilities to estimate effects of future development. (Purdin-NWWA)

RELIABILITY OF CYCLIC SURFACE AND GROUNDWATER STORAGE SYSTEMS FOR WATER SUPPLY: A PRELIMINARY ASSESSMENT,
Washington Univ., Seattle. Charles W. Harris Hydraulics Lab.
D. P. Lettenmaier, and S. J. Burges.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180870, Price codes: A04 in paper copy, A01 in microfiche. Technical Report No 64, November 1979. 70 p, 14 Fig, 8 Tab, 27 Ref. OWRT A-097-WASH(2).

Descriptors: *Model studies, *Water storage, *Reservoir storage, *Aquifer systems, Groundwater recharge, Pumping, Inflow water balance, Synthetic hydrology, Cost analysis, Feasibility studies, Markov processes, Mathematical studies, Stream flow.

A simplified cyclic water resources system involving a single surface reservoir and an adjacent storage aquifer was modeled and evaluated both physically and economically. If fixed annual water demand cannot be met by annual inflows to the surface reservoir, pumpage from the aquifer is used to supply the deficit. The aquifer is recharged by surface reservoir release during periods of reservoir inflow in excess of storage capacity. Parameters used to assess physical performance include indices of aggregate system supply deficits, pumping requirements, and the frequency of limitation situations such as empty or full aquifer, empty or full surface reservoir, and pumping or recharge equal to capacity. For the economic analysis a 40 year project life was assumed. Thirty-two physical and streamflow parameter combinations were used with the empirical cumulative distribution function of 18 performance measures to generate data. Recharge and pumping capacities were set to relatively large values so that system performance was generally governed by the combined storage capacity. For the situations modeled, pumpage from the aquifer was able to prevent system failure when surface supplies were not adequate. The least cost system was found to be one with the minimum surface storage needed to provide reliability for the system. Providing buffering against variations in stream flow by aquifer storage cost approximately an order of magnitude less than providing surface storage. (Seigler-IPA)

CULTURAL RESOURCE SURVEY AND TESTING AT THE MCGEE CREEK PROJECT, OKLAHOMA,
Environmental Assessments, Inc., Pauls Valley, OK.
P. McGuff.
Report, February 1980. 569 p, 83 Fig, 86 Tab, 19 Ref, 6 Append. 8-07-50-VO171.

Descriptors: *Surveys, *Archaeology, *Oklahoma, *History, *Dating, Land use, Population, Reservoirs, Erosion control, Project planning, McGee Creek Project.

An archaeological survey of the McGee Creek Project area in 1978 identified 435 localities of cultural activity of which 49 were evaluated and tested to develop approaches for reducing project related damage to the sites. The dam and reservoir for the project will involve 11,040 acres in southeastern Atoka County in Oklahoma. A brief history of the area is given. The area was once part of the Caddoan culture area that became sparsely settled by Old World people before it became Choctaw and Chickasaw land from 1830 to 1889. Early white settlers than came in mostly from the south. In general the area has been exploited for its resources and farming is not practical except on a very restricted basis. Parts of the project area were surveyed more intensly than others depending on the amount of destruction expected. A maximum interval of 20 meters was used for parallel survey transects. Site information collected and recorded included cultural affiliation, horizontal extent, vertical extent, physiographic location, condition, environmental placement, and potential significance. Three categories of sites were identified, 219 prehistoric, 52 historic, and 72 modern. It is recommended that a mitigation program be developed to sample 10% of the cultural fill at worthy prehistoric and historic sites and to study erosion at these sites and the possibility of constructing inhibitors to protect these sites from erosion. (Seigler-IPA)

THE CLEAN WATER ACT: UNEXPECTED IMPACTS ON INDUSTRY,
C. J. Koch, and R. A. Leone.
The Harvard Environmental Law Review, Vol 3, p 84-111, 1979.

Descriptors: *Economic impact, *Cost analysis, *Federal Water Pollution Control Act, *Industrial production, Industries, Decision making, Legislation, Costs, Federal government, Administrative agencies, Water pollution control, Economics.

The possible unanticipated economic and political consequences of water pollution controls imposed by the 1972 Clean Water Act on the tissue paper industry are examined. Analyzed in detail are the economics of regulation. It is suggested that as a direct result of governmental regulation a differential in the industry compliance cost curve will exist. This impact on the compliance cost curve may raise problems of economic equity among competing producers and between producers and consumers. The imposition of water pollution controls on the tissue industry has reduced the number of plant closings, and actually extended the life of existing plants. This is primarily based on the rationale that new capacity has higher abatement

costs than existing capacity. Given the compliance cost curve's importance, the likelihood that the federal Environmental Protection Agency would undertake a conscious policy of manipulating or managing its shape is examined. This could be effectuated by enacting a policy of leniency for high-cost abaters, with consumers as the primary beneficiaries. The analysis concludes that a conscious policy of curve shaping is unlikely due to legal constraints and resource limitations. (Schwerer-Florida)

ANNUAL REVIEW OF ACTIVITIES - 1975: WATER RESOURCES COMMITTEE, ARIZONA.
American Bar Association, Washington, DC. Natural Resources Section.
Natural Resources Lawyer, Vol 9, No 2, p 319-53, 1976.

Descriptors: *State governments, *Legislation, *Judicial decisions, *Water rights, Administrative agencies, Water law, Environmental effects, Legal aspects, Federal jurisdiction, Water pollution control, Water policy.

In Arizona bills were introduced providing for county water conservation districts. Two suits involving groundwater uses were filed on behalf of the Papago Indians. In California, Appellate Courts issued important decisions in two groundwater cases and touched upon the delicate area of federal-state relations. In Colorado, the important cases dealt with the adjudication of water rights, disputes over ownership, and Denver's delivery of water outside it political boundaries. The important state water legislation concerned tabulation of adjudicated water rights, condemnation of water rights by municipalities, water supply, definition of different types of pollutant discharges, and classification of permits. In Idaho, the Idaho Supreme Court ruled that the United States must quantify all of its reserved water rights. In Maine, the legislature enacted legislation limiting or prohibiting the anchorage of oil carrying vessels in Maine coastal waters. In New Mexico, the legislature established the framework for water research, conservation and development projects. In Oregon, the offices of the State Engineer and the Water Resources Board were combined. In Utah, legislation was proposed which would change enacting Utah's appropriation system. (Wilson-Florida)

BOUNDARY DELIMITATION IN THE ECONOMIC ZONE: THE GULF OF MAINE DISPUTE.
Maine Law Review, Vol 30, No 2, p 207-245, 1979. 10 Fig.

Descriptors: *Canada, *United States, *Law of the sea, *Boundary disputes, Political aspects, Boundaries(Surface), Oceans, International law, Jurisdiction, Continental shelf, International waters.

The realities of randomly concentrated and limited resources, complicated by the political geography of the oceans, have made maritime boundary delimitation a crucial international issue. Maine boundary delimitation falls into three broad categories. First is the drawing of baselines along a coast that will close off a nation's internal waters. Second, is the seaward limit of the various marine zones of national jurisdiction. The third is the international maritime boundary between adjacent and opposite states. A three-part analytical process is presented in the delimitation of international boundaries in the economic zone. First, the legal history of boundary delimitation in other marine zones is reviewed. Second, current proposals for economic zone boundary delimitation at the Third United Nations Conference on the Law of the Sea are analyzed. Finally, an assessment is given of the current economic zone boundary dispute between the United States and Canada in the Gulf of Maine. (Wilson-Florida)

EFFICIENCY IMPACTS OF COST SHARING ON SHORELINE MANAGEMENT,
National Bureau of Standards, Washington, DC.
H. E. Marshall.
Coastal Zone Management Journal, Vol 2, No 4, p 369-382, 1976. 3 Tab.

Descriptors: *Cost-sharing, *Shore protection, *Flood protection, Conservation, Shores, Protection, Programs, Beach erosion, Federal government, Management.

The nation's shorelines are being eroded by high winds and waves. As man continues to settle upon and develop on the ocean and Great Lakes shorelines, the concern over protection against human injuries and property damages from high winds and waves increases. Non-federal interests have traditionally received federal help in the form of cost-sharing for protective structures. Existing and alternative cost-sharing rules for shoreline protection are compared on the basis of economic efficiency. Both engineering and management techniques are examined for beach erosion, hurricane and emergency coastal flood protection. The present cost-sharing system appears to influence local interests to choose costly techniques of protection, engineering rather than management techniques, and under certain conditions, inefficient and overbuilt protective structures. These biases could be reduced if all engineering and management techniques for reducing shoreline damages were subject to the same percentage cost-sharing rules. (Daniels-Florida)
W80-04917

FEDERAL CONSISTENCY AND STATE EXPECTATIONS,
W. C. Brewer, Jr.
Coastal Zone Management Journal, Vol 2, No 4, p 315-325, 1976.

Descriptors: *Coasts, *Shore protection, *Zoning, Federal government, Land management, Programs, Administrative agencies, Legislation, Regulation, State government, Management.

The 1972 Coastal Zone Management Act requires federal projects be consistent with approved state coastal management programs. This is an important incentive for states to complete their programs. There are state obligations also. As a condition of program approval, states must first consult with the federal agencies concerned and provide opportunity for comment to avoid conflicts. This mechanism protects the federal agencies' interests. States must also give adequate consideration to the national interests involved in the siting of facilities necessary to meet non-local requirements. The federal consistency requirement is subject to various exceptions whose scope remains undetermined. One such uncertain exception is the exclusion from the coastal zone of federal lands 'the use of which is subject solely to the sole discretion ... of the federal government....' Despite these uncertainties, the consistency provision represents a major change in federal policy, which has traditionally allowed federal agencies to operate largely without concern for state land or water use requirements. (Daniels-Florida)

COASTAL ZONE MANAGEMENT FROM AN ADMINISTRATIVE PERSPECTIVE: A CASE STUDY OF THE SAN FRANCISCO BAY CONSERVATION AND DEVELOPMENT COMMISSION,
Texas A and M Univ., College Station.
G. C. Swanson.
Coastal Zone Management Journal, Vol 2, No 2, p 81-102, 1975. 1 Fig, 3 Tab.

Descriptors: *California, *Coasts, *Project post-evaluation, *Shore protection, Legislation, Management, Conservation, Development, Regulation, Planning, California, Resources development, Administrative agencies.

Competent administration of the 1972 Coastal Zone Management Act (Act) must proceed on an informed understanding of the organizational styles and capacities of agencies presently dealing with similar problems. One such agency is the San Francisco Bay Conservation and Development Commission, the forerunner of the California model of coastal management. An analysis of this model can shed light on what can be expected administratively as the Act becomes an operational reality. The major administrative insights offered fall into the following areas: (1) effectiveness assessment - the Commission's success can be systematically defined and measured, with important implications for coastal resource management; (2) organizational success - the Commission's administrative style can be analyzed in terms of the synergy which has been created between its organizational structure and decision-making process; and (3) implications of agency success - the Commission's most valuable lessons can be identified and applied to other situations. (Wilson-Florida)

COASTAL LAND USE CONTROL IN SWEDEN,
San Diego Univ., CA. School of Law.
R. G. Hildreth.
Coastal Zone Management Journal, Vol 2, No 1, p 1-29, 1975. 6 Fig.

Descriptors: *Foreign countries, *Coasts, *Shore protection, *Land use, State governments, Development, Legislation, Regulation, Conservation, Environmental control, Building codes, Public rights.

Several states in the United States recently adopted some form of special control over coastal land use, stimulated in part by the 1972 federal Coastal Zone Management Act (Act). Under the Act, 30 states are eligible for grants to assist them in developing and administering such coastal land use controls. In Sweden, such controls have been greatly expanded by recent amendments to existing legislation. Regulation of coastal land use occurs at all levels of government in Sweden. Prior to the adoption of legislation, Swedish customary law provided a limited form of coastal land use control. The 1952 Shoreline Act was enacted to implement and perpetuate this body of law. The 1964 Nature Conservacy Act gave Swedish counties the power to declare protected zones, in which building permits were required. Other Swedish legislation includes the Environment Protection Act, the Building Act, and the Expropriation Act. Recent amendments to these acts decrease the compensation due coastal landowners for restrictions placed on the use of their property and increase the specificity in the planning processes for coastal areas. These techniques are relevant to coastal zone management in the United States. (Wilson-Florida)

SHORELINE DEVELOPMENT CONTROLS AND PUBLIC ACCESS TO THE OCEAN'S EDGE,
California Coastal Zone Conservation Commission, San Francisco.
T. Crandall.
Coastal Zone Management Journal, Vol 1, No 4, p 451-466, 1974. 6 Fig, 1 Tab.

Descriptors: *California, *Shore protection, *Land development, Land use, Resources development, Recreation, Coasts, Local governments, Aesthetics, Public benefits, Environmental control.

The San Diego Coast Regional Commission is faced with the responsibility of approving, approving with conditions, or denying permits for development proposed along the scenic coastal bluffs of San Diego County. It has adopted guidelines for bluff-top development which assure retention of scenic vistas and public access, while permitting private landowners reasonable use of their property. These unique guidelines delineate certain environmental and aesthetic parameters within which bluff-top development may take place. The four major guidelines require development to: (1) enhance the overall appearance of the coastal bluff area, by encouraging the use of landscaping and exterior building materials that complement the natural form, texture and color of the coastal bluffs; (2) preserve adequate vista corridors

through each coastal bluff-top project; (3) provide public access from the nearest public street to and along the bluff edge; and (4) preserve the coastal bluff face in its natural condition. An integral part of the commission's guidelines was landscape criteria designed to ensure the continued attractiveness of coastal bluffs. The bluff-top guidelines have been accepted as reasonable by developers. (Wilson-Florida)

ESTUARINE SANCTUARIES - THE OREGON EXPERIENCE,
J. F. Ross, and D. L. Hepp.
Coastal Zone Management Journal, Vol 1, No 4, p 433-446, 1974. 4 Fig, 1 Tab.

Descriptors: *Oregon, *Estuaries, *Shore protection, Legislation, Estuarine environment, State governments, Coasts, Resources development, Ecology, Estuarine fisheries, Environmental control.

In response to the growing recognition of the critical importance of estuaries and the intense pressure to change them, the Coastal Zone Management Act established a program to assist states in long-term protection of selected natural estuarine areas. A nationwide system of estuarine sanctuaries will be created to preserve, for research and education, areas respresentative of each of the major biogeographical estuarine types. Oregon's candidate, the South Slough of Coos Bay, is the first area selected as an estuarine sanctuary by the federal Office of Coastal Zone Management, largely because of early groundwork done by local people. The establishment of an estuarine sanctuary is complicated by interwoven ecological, social, economic and political issues. The potential benefits of the protection of an irreplaceable resource and the contribution to coastal zone management unquestionably justify the effort. Oregon anticipates completion of purchases and agreements and the establishment of the South Slough estuarine sanctuary by early spring 1975. (Wilson-Florida)

SAVING CALIFORNIA'S COAST: THE COASTAL ZONE INITIATIVE AND ITS AFTERMATH,
Resources for the Future, Inc., Washington, DC.
R. G. Healy.
Coastal Zone Management Journal, Vol 1, No 4, p 365-394, 1974.

Descriptors: *California, *Coasts, *Shore protection, *Land use, Buildings, Regulation, Permits, Construction, Coastal structures, Development, Recreation, State governments.

In 1972 California voters approved a proposal that would give control over nearly all construction along its entire coast to powerful state and regional commissions. By the end of 1975, these commissions must present an enforceable coastline plan to the legislature. Meanwhile, they have broad power to prevent or modify proposed building in an area extending from 3 miles offshore to 1,000 yards inland from the shoreline. The permit zone includes a wide variety of natural environments and possible area uses, including open water, large tracts of undeveloped land, beach towns and resorts, and some of the nation's most valuable urban property. In dealing with permit decisions, the commissions have had to face the real problems of the coast. The coastal regulators have acted on more than 5,000 permits, including controversial issues of beach access, density, agricultural preservation, power plant siting, and growth inducement. The state commission has interpreted its powers broadly, and counteracted an initial timidity on the part of the regional boards. (Wilson-Florida)

REGULATION OF WATER POLLUTION FROM AGRICULTURAL POINT SOURCES IN NEBRASKA: IMPACT OF THE NPDES PERMIT PROGRAM ON FEEDLOT OPERATIONS,
H. C. Harris, and M. Hendricksen.
Creighton Law Review, Vol 9, No 1, p 83-101, September 1975.

Descriptors: *Nebraska, *Agricultural runoff, *Pollution abatement, *Feedlots, Permits, Federal water pollution control act, Environmental effects, Livestock, Remedies, Water pollution control, Agriculture, Water pollution sources.

The National Pollutant Discharge Elimination System, NPDES, incorporated into the Nebraska plan, prohibits the discharge of pollutants from a point source into any Nebraskan waters without a permit. Animal confinement facilities, or feedlots, are point sources. Every Nebraska feedlot operator with a present or potential pollution discharge into Nebraskan waters must apply for an on-site inspection. The inspection determines whether the operator must obtain an NPDES permit and/or construct livestock waste controls. To ensure compliance with the required standards, a monitoring system may be established. Any feedlot operator in violation of effluent limitations, permit conditions, or administrative orders may be subject to administrative penalties, injunctions and civil or criminal suits by either state or federal authorities. The effectiveness of Nebraska's regulation of water pollution from livestock waste runoff and other sources is evaluated under its state administered NPDES permit program. (Schwerer-Florida)

AN EVALUATION OF LOUISIANA SUPERPORT STUDIES AND IMPLICATIONS FOR COASTAL ZONE MANAGEMENT,
Louisiana State Univ., Baton Rouge. Dept. of Marine Sciences.
J. H. Stone.
Coastal Zone Management Journal, Vol 3, No 1, p 7-37, 1976. 2 Fig, 2 Tab, 30 Ref.

Descriptors: *Louisiana, *Coasts, *Shore protection, *Research and development, Environmental effects, Decision making, Management, Analytical programs, Economic impact, Techniques.

The economic and environmental consequences of a proposed Louisiana superport have been studied the last three years. These studies provided technical information and management alternatives. These studies are evaluated to derive implications, to make suggestions and to point out some analytical tools for coastal zone management. Management alternatives included: (1) state control to avoid multiple superport developments; (2) details for an Environmental Protection Plan; (3) comparisons of onshore and offshore sites; and (4) planning for ancillary development. Policy decisions which resulted include many of the research recommendations. Recommended environmental goals are listed. Six general features of the superport studies that are related and important to coastal zone management are discussed. Environmental research can influence policy decisions and limit available options provided some legal structure is created, quality control is implemented, and technological and environmental problems are recognized. Various analytical tools, such as energy cost-accounting, group critique and simulation models, have wide application for use in coastal zone management. A bibliography is included. (Daniels-Florida)
W80-04926

IDENTIFYING THE 'PUBLIC' FOR PARTICIPATION IN COASTAL ZONE MANAGEMENT,
California State Office of Planning and Research, Sacramento.
J. Ashbaugh, and J. Sorensen.
Coastal Zone Management Journal, Vol 2, No 4, p 383-409, 1976. 2 Tab, 29 Ref, 2 App.

Descriptors: *Coasts, *Shore protection, *Project planning, Planning, Administration, Regulation, Legislation, Surveys, Programs.

The federal Coastal Zone Management Act requires each coastal state apply for certification of its plan to design and implement a program of public participation. One of the more difficult aspects of public participation is the explicit identification of those groups and individuals who constitute the public with whom the coastal zone management agency will interest and collaborate in program development. Many factors raise difficulties in identifying and maintaining contact with the public. Five methods can be used to identify organized public groups: (1) self-identification; (2) snowballing; (3) directory research; (4) issue analysis; and (5) substitute advocacy. These methods, either alone or combined, can sufficiently identify those groups and individuals with whom the coastal management agency will interact, though other methods exist. A form survey is described that was designed to identify and maintain contract with groups that desired to participate in the development of California's coastal plan. (Daniels-Florida)
W80-04927

GROUNDWATER AUGMENTATION PLANS IN COLORADO,
J. P. McMahon.
The Denver Journal of International Law and Policy, Vol 6, Special Issue, p 552-566, 1976.

Descriptors: *Colorado, *Groundwater resources, *Water allocation(Policy), Prior appropriation, Water rights, Consumptive use, Legal aspects, Diversion, Diversion loss returns, Water supply, Groundwater resources.

The Colorado Supreme Court recently confronted two appeals from Colorado water courts. The dispute regarded questions relating to the attributes of Colorado water rights and the administration of these rights in accordance with the priority system. Both applicants sought court approval of augmentation plans under the Colorado statutes. The diversions under the proposed operations could be larger than those historically attributable to the water rights used for augmentation. Opponents argued that to grant permits would be a major break in the doctrine of prior appropriation; that these were not augmentation plans but really changes to water rights. In granting the permits, the Supreme Court interpretation of the phrase 'plan of augmentation' found the applicants to be within the scope and intent of the pertinent Colorado statutes. In the court's opinion, water was available for appropriation if no injury occured. Under these cases, an individual, low consumptive user, wanting to change his water use or bring new usages into the system may be required to rectify only the depletive effects of such water use. (Schwerer-Florida)
W80-04928

THE ROLE OF THE STATE IN WATER PLANNING, RESEARCH, AND ADMINISTRATION,
Colorado Dept. of Natural Resources, Denver.
H. D. Sherman.
The Denver Journal of International Law and Policy, Vol 6, Special Issue, p 449-453, 1976.

Descriptors: *Colorado, *Water management(Applied), *Water resources development, State governments, Administrative agencies, Waste disposal, Beneficial use, Legal aspects, Colorado River, Regulation, Legislation, Planning.

The future role of the Colorado State Government in water resource planning is evaluated. In view of changing conditions, state regulation and control will require adaptation. Several key areas of change are perceived. Initially, increased water consumption and salinity problems will increase the frequency of water rights transfer, change in point of diversion, and change in use. Additional areas of change analyzed include large-scale water resource developments, state government growth policy, and the managerial function of state agencies. Suggested changes in the pure appropriation system are also explored, with comparisons to Wyoming and Utah. Since Colorado water law now assumes that all growth and development give rise to 'beneficial use' of water, a legislative clarification is needed to develop effective guidelines for state water policies. Several other areas of needed change are examined and possible improvements are suggested. (Schwerer-Florida)
W80-04929

INTERSTATE RIVER COMPACTS: IMPACT ON COLORADO,
Upper Colorado River Commission, Salt Lake City, UT.
I. V. Goslin.
The Denver Journal of International Law and Policy, Vol 6, Special Issue, p 415-439, 1976. 1 Tab, 1 App.

Descriptors: *Colorado, *Colorado River, *Colorado River compact, *Interstate compacts, Conservation, Interstate rivers, Water resources, Water contracts, Consumptive use, Water conservation, Water allocation(Policy), Water quality.

Water compacts to which Colorado is a party influence the nature and direction of future state development, conservation, and utilization of water resources. Compacts are a mutually agreeable means of settling existing water disputes and preventing future controversies over the waters of interstate streams. To date, Colorado is a party to nine interstate water allocation compacts and to three interstate agreements that can be designated as subcompacts. Their terms have served as parameters for resource development processes. The Colorado River compact is regarded as the grandfather of water allocation compacts in the United States. The following is a listing of the remaining eight compacts to which Colorado is a party: La Plata River compact, South Platte River compact, Rio Grande compact, Republican River compact, upper Colorado River Basin compact, Arkansas River compact, Costilla Creek compact, and the Animas-La Plata Project compact. Compacts have been beneficial to Colorado in protecting the use of interstate waters against prior appropriation and use in other states. Other areas of significant impact include water quality, water supply and litigation. (Schwerer-Florida)
W80-04930

THE ROLE OF WATER IN THE HISTORY AND DEVELOPMENT OF COLORADO,
D. Lavender.
The Denver Journal of International Law and Policy, Vol 6, Special Issue, p 407-414, 1976.

Descriptors: *Colorado River, *Colorado River basin, *Colorado River compact, *Colorado, Agriculture, Mining, Prior appropriation, Mountains, Beneficial use, Interstate compacts, Interstate rivers.

Water's role in Colorado's development is controlled largely by geography. High elevation causes the capture of a disproportionate amount of rainfall, and the streams created are difficult to control. Agriculture was the first water use, but the law that developed grew out of the mining industry. With increasing colonization came conflicts over accelerated demands on water resources, especially the Colorado River. Intrastate problems were settled by the law of prior appropriation. This was not adequate for interstate problems, and compacts were necessary instead. Colorado got 52% of the Colorado River's upper basin, all of which originates on Colorado's western slope. Since there was little beneficial use there, the Eastern slope has been appropriating it. Now there is opportunity for profitable development on the western side, and a fear that the water resources will be insufficient. The outcome is unclear, but prior history indicates that a compromise might be a better solution than strict prior appropriation law. (Tabano-Florida)
W80-04931

GLOBAL WATER LAW SYSTEMS AND WATER CONTROL,
Colorado State Univ., Fort Collins.
G. E. Radosevich.
The Denver Journal of International Law and Policy, Vol 6, Special Issue, p 263-282, 1976. 1 Fig.

Descriptors: *Water allocation(Policy), *Water control, *Water management(Applied), *Consumptive use, Water consumption(Except consumptive use), Water rights, Water law, Water policy, Water resources, Water supply, Governmental interrelations.

Water laws are viewed as policy expressions that must be dynamic and the product of evolutionary processes. Several water systems of the entire world are summarized here. Systems with a customary religious base view water as part of man's cosmogony, allowing no private ownership. Latin American nations use either a traditional, riparian-influenced system, or a modern system of state comprehensive water management. Several European systems are discussed, such as the United Kingdom's governed entirely by statute. The federated system of the United States is also summarized, as are the common law - influenced Asiatic systems. Eight general conclusions are reached: (1) there is a clear tendency toward public ownership; (2) the basin is an imperative for improved management; (3) users should have input in decision-making; (4) unity is needed at all government levels; (5) water courts should be established; (6) 'acquired' rights must be redefined; (7) vested rights should not be a permanent constraint; and (8) specialists need an interdisciplinary foundation. (Tabano-Florida)
W80-04932

FISHERY CONSERVATION AND MANAGEMENT ACT OF 1976: AN ACCOMMODATION OF STATE, FEDERAL AND INTERNATIONAL INTERESTS,
A. J. Tassi.
Case Western Reserve Journal of International Law, Vol 10, No 3, p 703-738, Summer 1978.

Descriptors: *Fish conservation, *Fish management, *Law of the seas, Fisheries, International law, Regimes, Federal government, Conservation, Legislation, Regulation, Jurisdiction.

The impact of the 1976 Fishery Conservation and Management Act (FCMA) upon traditional regulatory and conservation efforts of fishery resources is examined. Primary emphasis is given to fishery jurisdiction in United States (U.S.) coastal waters. The traditional approach to fishery jurisdiction is analyzed in the context of an Alaskan Supreme Court decision, State v. Bundrant. This case accurately illustrates the conventional interplay among state, federal, and international interest and the treatment accorded each before the FCMA. By enacting the FCMA Congress entered into the field of extraterritorial fishery jurisdiction. They provided a national regulatory authority aimed at accomodating state, federal and international interests. The pertinent FCMA provisions, and their impact upon state and federal management interests are examined. The FCMA's influence in the area of international fishery affairs is discussed, including the mandatory revision of certain U.S. obligations. The potential tensions which could result from this requirement to renegotiate treaties is examined. Overall, the FCMA is evaluated favorably. (Daniels-Florida)
W80-04933

WATER LEGISLATION PERSPECTIVES FOR ALABAMA,
Alabama Univ., University.
H. Cohen.
Alabama Law Review, Vol 26, No 1, p 177-213, Fall 1973.

Descriptors: *Alabama, *Water resources, *Water allocation(Policy), Regulation, Water utilization, Water policy, Water rights, Legislation, Water users, Control, Administration.

Alabama's response to the problems inherent in the allocation and use of water is examined. The court's are unable to plan and coordinate water allocation, as is illustrated by hypothetical situations. The problem areas discussed include riparian rights, groundwater use, and diffused surface water and the control of watercourses. Legislation of states other than Alabama enacted to alleviate the above problems is examined. The controls over individual users necessary to effectively implement comprehensive planning give rise to constitutional attacks on water use statutes. Two grounds for a constitutional challenge are improper delegation of legislative authority and takings. Potential challenges to Alabama's water rights legislation are examined. A legislative approach to water control is suggested to Alabama legislative which will help Alabama take a bold step in the direction of state water control. (Daniels-Florida)
W80-04934

MANAGING RECREATIONAL RIVERS,
National Association of Attorneys General, Raleigh, NC.
B. A. Rich.
Akron Law Review, Vol 8, No 1, p 43-56, Fall 1974.

Descriptors: *Illinois, *Recreation facilities, *Public access, Recreation, Navigable waters, Recreation demand, Public rights, Riparian rights, Regulation, State governments, Legal aspects.

Various regulatory approaches are discussed to provide and protect rivers with potential for use as public recreational facilities. These approaches are applied to the rivers of Illinois. Whenever public use of natural watercourses is considered, the concepts of riparian rights and navigability are fundamental issues. The evolution of these doctrines and their relation to public recreational water use are discussed. Methods by which Illinois may acquire riparian land to expand water-based recreation facilities, and the problems created by such methods of acquisition are discussed. By using examples of other state methods used to acquire water rights for the general public, alternative methods for acquiring recreational facilities for the public are presented. These alternative methods are progressive reform measures, enabling a state to provide needed recreational facilities. (Daniels-Florida)

THE LEGAL IMPLICATIONS OF GROUND WATER HEAT PUMP USE,
National Water Well Association, Worthington, OH.
J. Miller.
Ground Water Heat Pump Journal, Vol 1, No 1, p 29-35, Spring, 1980. 1 Tab.

Descriptors: *Heat pumps, *Legal aspects, *Permits, Ground water, Water quality, Water utilization, Well permits, Well regulations, Regulation, Government, Legislation, Water pollution control, Waste water disposal, Effluents, Injection wells, Local governments, Domestic water, Water law, State governments.

Federal, state, and local laws and regulations may impede ground water heat pump use. In many areas the drilling of a well requires a permit unless it has a certain capacity or is used for domestic purposes. In some areas the use of ground water for heating or cooling is not considered domestic use. Disposal of heat pump effluent is also subject to statutes and regulations such as the National Pollutant Discharge Elimination System (NPDES) and the Underground Injection Control Program (UIC). Federal regulations pertaining to ground water quality will not have a significant impact as the wells used for heat pumps are Class V wells under the UIC program. At the state level, well construction requirements vary. The expense of these requirements may make heat pump use impractical. Where water use restraints exist, usually in the form of permit requirements, they are not serious deterrants to heat pump use. Some local controls on well construction, ground water use and quality, and waste disposal may adversely affect heat pump utilization. Most local regulations, however, will not seriously impede widespread use of heat pumps. A summary table lists state regulations for domestic ground water heat pump use and effluent disposal. A 'COMMON HERITAGE' APPROACH TO FISHERIES THROUGH REGIONAL CONTROLS,
M. J. Brodd.
New York Journal of International Law and Politics, Vol 10, No 1, p 171-202, Spring 1977.

Descriptors: *Law of the Sea, *Marine fisheries, *Regional development, United Nations, Interna-

tional law, Treaties, International waters, Regimes, Resources development, Resource allocation.

The 1977 Informal Composite Negotiating Text (ICNT), produced by the United Nations, provides that seabed resources beyond the limits of national jurisdiction, will be controlled by an international authority for the benefit of all nations. The approach is exploitation pursuant to the common heritage of mankind. The ICNT also establishes an Exclusive Economic Zone for each coastal nation for fishery exploitation with a breadth of 200 miles. Landlocked states are permitted to share in the exploitation of fisheries within adjoining state's exclusive zones. If the ICNT is adopted, one problem will be to harmonize the concepts of exclusive national rights of a coastal state in its economic zone and the landlocked nations rights to share in that zone's resources. The possibility of required organizations as a means of implementing these competing rights is explored. Regional agreements and control are a viable compromise. An international regime of multistate regional arrangements is justified by and consistent with the common heritage principle. Under regional regimes, the benefits of both these competing approaches to resource utilization can be realized within the spirit of international cooperation. (Daniels-Florida)

PROSPECTS FOR DEEP SEABED MINING,
L. S. Ratiner.
The Journal of International Law and Economics, Vol 12, No 2, p 191-194, 1978.

Descriptors: *Beds under water, *International waters, *Mining, *Law of the Sea, United States, Legislation, Regimes, International law, United Nations, Treaties, Resource development.

United States (U.S.) legislation is needed to promote private development of ocean mining and to facilitate the establishment of an international mining enterprise. Ocean mining will help the U.S. become more self-sufficient in its supplies of various resources, such as cobalt, copper, mangenese and nickel. Reliance on countries advocating producer cartels creates the risk of supply interruptions. Emerging economic nationalism in developed countries further decreases opportunities for foreign investment in resource development. The key difficulty in the development of ocean mining is that investments made under present international law could be significantly impaired by a later treaty. This risk must be reduced, if not removed. The traditional approach has been to provide grandfather rights in new laws for previous investments. In the case of a treaty, this would require agreement by many countries. The U.S. should assure that industry is compensated for its investment losses. The establishment of an international mining enterprise would hasten if domestic legislation were enacted and mining began promptly. If other countries see the U.S. aggressively pursuing ocean mining they will be motivated to negotiate a treaty. (Daniels-Florida)

AN ANALYSIS OF THE OUTER CONTINENTAL SHELF LANDS ACT AMENDMENTS OF 1978,
Nossaman, Waters, Krueger, Marsh and Riordan, Los Angeles, CA.
R. B. Krueger, and L. H. Singer.
Natural Resources Journal, Vol 19, No 4, p 909-927, October 1979.

Descriptors: *Continental shelf, *Resources development, *Water pollution control, Continental slope, Legislation, Energy, Federal government, Oil spills, Coasts, Leases, Administrative agencies.

Beneath the 1.3 million square miles of continental shelf over which the United States has jurisdiction, there exists an enormous quantity of energy resources. The first federal act to authorize the leasing of the resources of the Outer Continental Shelf (OCS) was the 1953 Outer Continental Shelf Lands Act. This statute remained unchanged until the passage of the 1978 Outer Continental Shelf Lands Act Amendments (1978 Act). While the bulk of the 1978 Act consists of amendments to the 1953 Act, it also establishes an Offshore Oil Spill Pollution Fund and a Fisherman's Contingency Fund, and amends the 1972 Coastal Zone Management Act. The major policy objectives of the 1978 Act include: (1) making oil and other natural resources available; (2) protecting the environment; (3) maintaining free enterprise competition with respect to resources development; and (4) providing coastal states with an opportunity to participate in policy and planning decisions relating to the resources of the OCS. (Wilson-Florida)

THE COASTAL AREA MANAGEMENT ACT IN THE COURTS: A PRELIMINARY ANALYSIS,
North Carolina Univ. at Chapel Hill.
P. G. Glenn.
The North Carolina Law Review, Vol 53, No 2, p 303-343, December 1974.

Descriptors: *North Carolina, *Coasts, *Land use, *Shore protection, Environmental control, State governments, Regulation, Administrative agencies, Water resources, Legal aspects, Legislation.

The 1974 Coastal Area Management Act (Act) is a significant piece of legislation for North Carolina. The Act creates a mechanism for coordinated state and local regulation of land and water in the coastal area. This area has been denominated by the Coastal Resources Commission as an area of environmental concern. The formulation of general land use plans are required for each of the twenty coastal counties. The Act is virtually free of legislative direction on the substance of regulatory policy. The reason of the Act's lack of substantive content is that it is difficult to regulate aspects of potential dispute except in broad terms. Lawsuits dealing with the application of the Act to particular land probably will focus on the reasonableness of the regulation or order being contested. The Act mandates a permit system for certain development. Permit denials are likely to result in claims that the underlying regulation constitutes an unconstitutional taking of private property. Such attacks could invalidate the Act or substantially weaken it. (Wilson-Florida)

CONFLICT OF INTEREST RULES APPLICABLE TO WETLAND AGENCY MEMBERS,
C. L. Chambers.
Connecticut Bar Journal, Vol 49, No 1, p 178-188, March 1975.

Descriptors: *Connecticut, *Land use, *Wetlands, Judicial decisions, Administrative agencies, Legislation, Legal aspects, Zoning, Planning, Water policy, Water law, State governments.

The Connecticut Wetlands Act (Act) was amended in 1974 to limit the participation of members of Inland Wetlands agencies in decisions where there is conflict of interest. The amendment prohibits a member of any board or commission from participation in any hearing or decision upon any matter in which he is directly or indirectly interested either personally or financially. This amendment incorporates portions of the conflict of interest provisions in Connecticut statutes governing the disqualification of members of zoning authorities and planning and zoning boards. These statutes reflect the stringent prohibitions of Connecticut's case law in the conflict of interest area. The Act does not prohibit agency members from representing the viewpoint of other commissions where the viewpoint would contribute to balanced decision making. A leading case concludes that any decision as to whether a person's interest will be sufficiently disqualifying is necessarily a factual one which depends on the circumstances of the particular case. Implicitly, the Connecticut decisions appear to rely on a rebuttable presumption that the commissions and boards have acted with fair and proper motives. (Wilson-Florida)

ACID MINE DRAINAGE AND THE PENNSYLVANIA COURTS,
Duquesne Univ. of the Holy Ghost, Pittsburgh, PA. School of Law.
R. Broughton, T. A. Koza, and G. F. Selway.
Duquesne Law Review, Vol 11, No 4, p 495-555, Summer 1973.

Descriptors: *Pennsylvania, *Acid mine water, *Judicial decisions, *Coal mine wastes, Legislation, Coal mines, Legal aspects, Drainage, Constitutional law, Pollutants, Water pollution control, Streams.

In March 16 and April, 1973, Pennsylvania courts issued three decisions relating to coal mine drainage in Pennsylvania. These cases deal with major federal constitutional issues, and with some of the most critical technical and philosophical problems of any mine acid pollution control program. The discharge of acid mine drainage into already polluted waters was prohibited in Pennsylvania by the 1965 Clean Streams Law which was amended in 1970. In the Pittsburgh Coal and Harmar Coal cases, the Supreme Court decided that: (1) the Clean Streams Law was applicable to acid mine drainage from inactive as well as active mines; (2) the Clean Streams Law was Constitutional; and (3) there was substantial evidence to support a finding by the Sanitary Water Board. The Barnes and Tucker case involved a discharge from a mine after the mine was sealed. The Commonwealth Court held Barnes and Tucker not responsible for abatement and treatment of this acid mine drainage. (Wilson-Florida)

ENVIRONMENTAL CITIZEN SUITS: THREE YEARS' EXPERIENCE UNDER THE MICHIGAN ENVIRONMENTAL PROTECTION ACT,
Michigan Univ., Ann Arbor.
J. L. Sax, and J. F. DiMento.
Ecology Law Quarterly, Vol 4, No 1, p 1-62, Winter 1974.

Descriptors: *Michigan, *Adjudication procedure, *Water pollution control, Legal aspects, Water law, Land use, Judicial decisions, Pollution abatement, State governments, Legislation, Environmental control.

The Michigan Environmental Protection Act (Act) was the first statute to provide for citizen suits to protect the environment from degradation by either public or private entities. The federal Clean Air Act and Water Pollution Control Amendments, and several state statutes, have followed the Michigan lead. During the first three years since the Act's enactment, 74 cases have been initiated. The broad standing provision in the Act has produced a very diverse set of plaintiffs, local and state agencies, neighboring property owners, taxpayer and citizen groups, and established environmental organizations. One of the more important decisions was Irish v. Green. The plaintiff challenged a proposed housing development on four counts, one of which was that seepage from septic tanks was likely to cause water pollution. The court found for the plaintiff on the water pollution issue, but dismissed claims of wasteful land use and failure to provide an environmental impact statement. The Act has received relatively little substantive interpretation. One encouraging development is the frequency with which public agencies have invoked the Act. (Wilson-Florida)

PRIVATE ACTIONS FOR DAMAGES RESULTING FROM OFFSHORE OIL POLLUTION,
M. M. Gordon.
Columbia Journal of Environmental Law, Vol 2, No 1, p 140-192, Fall 1975.

Descriptors: *Oil spills, *Oil pollution, *Damages, International law, Federal government, State government, Common law, Water pollution, Jurisdiction, Compensation, Public rights.

Oil pollution of coastal and interior waters damages both private and public interests. Federal legislation deters both accidential and intentional discharge, but such legislation is deficient in protect-

ing private interests. Despite this gap in federal coverage, private damage suits are being brought. These suits are examined in the context of the relevant common law and recent developments at the state and international levels. United States jurisdiction extends to all admiralty and maritime cases. Admiralty jurisdiction is invoked when alleged conduct results in a maritime tort. Oil pollution of navigable waters can constitute such a tort. The traditional theories of liability discussed are negligence, private and public nuisance, trespass, unseaworthiness, and strict liability for abnormally dangerous activities. State legislation is classified under four headings. Maine's legislation is the most desirable for the private plaintiff. A board determines third party damages rather than a judicial proceeding in court. Recommendations are offered for legislation to remedy obstacles to recovery for offshore oil pollution. (Daniels-Florida)
W80-04968

LAYING THE FOUNDATION FOR SOPHISTICATED ENVIRONMENTAL STRATEGIES: A FLORIDA CASE STUDY,
Florida Univ., Gainesville.
J. W. Little.
Columbia Journal of Environmental Law, Vol 1, No 1, p 110-146, Fall 1974.

Descriptors: *Florida, *Permits, *Public rights, Legislation, Standards, Environmental effects, Legal aspects, Navigable waters, Preservation, Conservation, Constitutional law.

Two basic routes must be followed to increase the scope of existing environmental protections - public interest litigation and legislation. Public interest proponents have attained a high degree of sophistication in their efforts to expand public control over matters once thought controlled by private interests and government. Also described is how the law was molded through litigation before the sophisticated, strategy-laden environmental law suits of today. Today's public interest efforts are based on these earlier environmental campaigns. A Florida case history is given of the controversial dredging and filling of estuarine areas to demonstrate the development of environmental legal strategies. Local and state proceedings are discussed, involving the right of two small landowners to dredge and fill. The multitude of legal skirmishes clarifies state law and influences much protective legislation. Another factor was a federal ruling which allowed permit denial for dredge and fill based solely on environmental considerations. (Daniels-Florida)
W80-04969

FOREIGN ACCESS TO U.S. FISHERIES IN THE WAKE OF THE FISHERY CONSERVATION AND MANAGEMENT ACT,
G. S. Yarema.
Virginia Journal of International Law, Vol 18, No 3, p 513-567, Spring 1978.

Descriptors: *Fisheries, *Resource allocations, *Foreign countries, *Fish management, Foreign trade, Administrative decisions, Negotiations, Legislation, Conservation, Resources development, Management.

The impact of the 1976 Fishery Conservation and Management Act (FCMA) upon both the traditional and innovative types of foreign involvement in United States (U.S.) managed fisheries is analyzed. The FCMA scheme directly authorizes foreign fishing through international governmental negotiations. There are several contingencies on which such arrangements depend. The distinction that the FCMA draws between foreign fishing and U.S. fishing permits preferential access to the U.S. Zone for U.S. corporate fishing ventures controlled by foreign investors. Legislative proposals to restrict foreign investment in U.S. fishing corporations are discussed. Such measures would not contribute effectively to long-term management of the U.S. zones' resources, or serve the interests of important sectors of the domestic fishing industry. The application of FCMA to the purchase of the U.S. catch at sea by foreign-flag factory vessels under joint venture agreements is explored. The Department of Commerce has tried to regulate the allocation of harvested resources, but that effort exceeded the authority delegated by the FCMA. (Daniels-Florida)

THE LAW OF THE SEA AND REGIONAL FISHERIES POLICY,
South Pacific Commission, Noumea (New Calidonia).
R. E. Kearney.
Ocean Development and International Law Journal, Vol 5, No 2/3, p 249-286, 1978. 1 Fig, 6 Tab, 43 Ref.

Descriptors: *Law of the Sea, *Marine fisheries, *Fish management, *International waters, United Nations, Fisheries, Fish migration, Fish conservation, Regional development, Fish harvest, Resources development, Pacific Ocean.

The consequences of the inevitable acceptance of extended jurisdiction and its impact on fisheries policy in the South Pacific are considered within the framework of the principles outlined at the Third Session of the United Nations Law of the Sea Conference. The region's fisheries resources are dominated by highly migratory species, particularly tunas. The management of the fisheries on these species and the conservation of the species will require comprehensive regional cooperation. A regional fisheries agency is considering the required to protect the common interests of the region's developing countries which are inexperienced in fisheries management and in surveillance and enforcement capabilities. A wide range of possible functions of such a body is discussed, and a three-phase approach to the development of the agency is proposed. (Schwerer-Florida)

TRANSIT RIGHTS AND U.S. SECURITY INTERESTS IN INTERNATIONAL STRAITS: THE 'STRAITS DEBATE' REVISITED,
Pittsburgh Univ., PA.
C. E. Pirtle.
Ocean Development and International Law Journal, Vol 5, No 4, p 477-497, 1978.

Descriptors: *United States, *Straits, *Law of the Sea, *Military aspects, Oceans, Access routes, Transportation, Negotiations, International waters, Economic impact, United Nations, Navigation.

The issue of transit rights through international straits overlapped by an extension of territorial seas to 12 miles was the focal point of intense debate between the United States (U.S.) and strait states during the formative stages of the Third United Nations Law of the Sea Conference. Even though the Informal Composite Negotiating Text provisions on transit through straits reflect basic U.S. navigation and security interests. The issue of transit rights through straits is not a dead issue. Straits states may refuse to ratify a Law of the Sea treaty incorporating ICNT provisions on transit passage, or attempts to obtain a comprehensive LOS treaty may end in failure. In either case, the United States may be forced to accept a right of innocent passage through international straits. Transit security will be determined by political rather than legal considerations. U.S. security interests in the straits are not undermined by a right of innocent passage. (Schwerer-Florida)
W80-04972

AREA OF ORIGIN STATUTES - THE CALIFORNIA EXPERIENCE,
California State Dept. of Water Resources, Sacramento.
R. B. Robie, and R. R. Kletzing.
Idaho Law Review, Vol 15, No 3, p 419-441, Summer, 1979.

Descriptors: *California, *Water distribution(Applied), *Water supply, *Water transfer, State governments, Water works, Water policy, Water deliver, Water resources development, Wild river act, Water shed management, Water shortage.

As a result of unevenly distributed water supplies and water shortage problems in rapidly growing areas, several interregional water transfers have been implemented in California. Area of origin laws provide both an economically feasible source of water for transfer and protection to originating areas. Examined are the major water transfer acts effective in California, and the history of the nearly half-century old County of Origin and Area of Origin Acts. The application of these acts to the construction and operation of the California State Water Project is considered. The area of origin law affects the State Water Project in two ways. First, protected areas are given certain preferential rights to contract for water. Second, certain rights are given to construct projects or make diversions without being subject to the prior rights acquired under state application for the State Water Project. Recent federal and state statutes providing additional protection to areas of origin are also discussed. (Schwerer-Florida)
W80-04973

JUDICIAL REVIEW OF EPA ACTION UNDER THE CITIZEN SUIT PROVISION,
J. H. Chu.
Columbia Journal of Environmental Law, Vol 3, No 2, p 262-305, Spring 1977.

Descriptors: *Federal Water Pollution Control Act, *Administrative decisions, *Judicial decisions, *Water quality standards, Administrative agencies, Legislation, Reviews, Standards, Environmental effects, Legal aspects, Water pollution control.

Congress recognized the need for judicial review of administrative decisions affecting environmental concerns. Two statutory provisions in recent major federal pollution control legislation authorize judicial review of specified actions taken by the Administrator of the federal Environmental Protection Agency. One such provision allows for citizen suits against the Administrator where there is alleged failure to perform any nondiscretionary act or duty. The jurisdiction of each provision as interpreted by the courts is clarified. Expansion of the citizen suit jurisdiction is suggested. The present judicial test for establishing jurisdiction limits the citizen suit provision. Citizen suits have been limited by the courts to compelling the Administrator to act when he has breached a nondiscretionary act, and have been precluded from review of any abuse of discretion by the Administrator. A more rigorous standard of review is advocated. (Daniels-Florida)

SOME IMPLICATION OF OCEAN RESEARCH,
Washington Univ., Seattle.
W. S. Wooster.
Ocean Development and International Law Journal, Vol 4, No 1, p 39-50, 1977.

Descriptors: *Research and development, *Upwelling, *Law of the Sea, Political aspects, Oceans, Foreign countries, Research priorities, Economic justification, Research facilities, Scientific personnel.

Modern ocean research is more expensive than many laboratory sciences partly because of the costly research vessels required for field work. Funding for ocean research is justified on the basis of expected benefits. Such research also has political implications relating to the law of the sea and to the transfer of technology. Some of these implications can be illustrated in an analysis of upwelling research. Upwelling is an oceanic process of vertical flow and mixing that occurs on eastern sides of the Atlantic and Pacific Oceans and along the equator, among other locations. Potential benefits include predicting fishery yields, forecasting weather and climate, and locating and assessing nonliving resources. Because of the location of coastal upwelling, many developing countries are concerned with sharing in these benefits. This concern has affected negotiations over control of marine scientific research in the law of the sea negotiations, and is related to the need to develop scientific capability in such countries. (Wilson-Florida)

W80-04975

UNITED STATES POLICY WITH RESPECT TO HIGH SEAS FISHERIES AND DEEP SEABED MINERALS - A STUDY IN CONTRACTS,
L. W. Finlay.
Natural Resources Lawyer, Vol 9, No 4, p 629-643, 1976.

Descriptors: *Fisheries, *Beds under the sea, *Law of the Sea, *International law, United Nations, Conferences, Mining, Fishing, Oceans, International commissions, Treaties, Jurisdiction, *Beds under water.

Two important points are considered regarding the impact of the on-going deliberations in the Third United Nations Conference on the Law of the Sea on United States (U.S.) high seas fisheries and deep seabed minerals policies. First, proposals must be regarded as the views of individual states, rather than principles of existing law. Second, the convention will not create new international law for non-participating states. Exclusive coastal state fisheries jurisdiction to the 12 mile offshore is now generally accepted principle of international law. However, as the International Court of Justice decided in the Fisheries Jurisdiction Case, a coastal state may not take matters exclusively into its own hands in the determination of its preferential fishing rights. With respect to seabed resources, customary international law confirms the exclusive jurisdiction of coastal states over the seabed resources within their continental margins. (Wilson-Florida)

INNOVATIVE PROGRAMS AND PROPOSALS FOR THE RECONCILIATION OF PRIVATE AND PUBLIC INTERESTS IN THE CALIFORNIA COASTAL ZONE,
Nossaman, Waters, Krueger, Marsh and Riordan, Los Angeles, CA.
L. L. Marsh.
Natural Resources Lawyer, Vol 10, No 2, p 257-278, 1977.

Descriptors: *California, *Public rights, *Shore protection, *Land use, Land management, Regulation, State governments, Decision making, Judicial decisions, Equity, Urbanization, Legal aspects.

Urbanization problems are particularly acute in California's coastal zone. Reaction to these problems has spawned land use legislation at both the federal and state levels. The significant issue involved in land use management systems is the proper rule of private interests and the various governmental agencies representing public interest at the local, regional, state and federal levels. A few innovative proposals and suggestions for reconciling public and private interests in the coastal zone are focused on. The historic development of the private property concept and of government land use regulation is traced. The coordination of government planning and permit processing is discussed. The coordination process involves interagency cooperation in planning and permit processing. Procedures and arrangements provided for the reconciliation of public interests are also important to private interests. Historically, private interests were relied on to make land use decisions. Present problems demand modification of that system. Land use management systems must reconcile public and private interests and recognize the proper role of each. (Daniels-Florida)
W80-04977

ADDITION TO THE ANNUAL REVIEW OF SIGNIFICANT LEGISLATIVE, ADMINISTRATIVE AND JUDICIAL ACTIVITIES DURING 1976: WATER QUALITY COMMITTEE.
American Bar Association, Washington, DC. Natural Resources Section. Water Quality Committee.
Natural Resources Lawyer, Vol 10, No 2, p 297-322, 1977.

Descriptors: *Federal Water Pollution Control Act, *Judicial decisions, *Administrative decisions, Regulation, Permits, Legislation, Administrative agencies, Legal aspects, Water pollution control, Water law.

In 1976 no significant or substantive changes were made in the Federal Water Pollution Control Act (FWPCA); Safe Drinking Water Act; or the Marine Protection, Research and Sanctuaries Act. The federal Environmental Protection Agency (EPA), which administers these acts, promulgated a broad body of important regulations in 1976. A large number of significant judicial decisions interpreting the FWPCA's requirements were rendered in 1976. These administrative and judicial decisions are discussed. The EPA administrative decisions concerned (1) Secondary Treatment of publicly-owned treatment works; (2) Effluent limitation guidelines and new source performance standards for industrial point sources; (3) Toxic pollutant effluent standards; (4) Pretreatment; (5) Oil and Hazardous Substances; (6) Marine Sanitation devices; (7) Thermal discharges; (8) Dredged or fill material; and (9) the NPDES permit program. The judicial decisions between January 31, 1976 and February 23, 1977, shows trends and inconsistencies between cases. Principle emphasis is on cases involving the central regulatory and enforcement provisions of Title III or the permit provisions of Title IV of the FWPCA. Cases involving oil spill and citizen suit provisions are reviewed. Cases concerning the sewage treatment facility grant program of Title II are not reviewed. (Daniels-Florida)
W80-04978

COAL SLURRY TRANSPORTATION SYSTEMS AND RELATED WATER RIGHTS AND WATER QUALITY PROBLEMS,
International Paper Co., Mobile, AL.
W. Kiechel, Jr.
Natural Resources Lawyer, Vol 11, No 3, p 411-417, 1979.

Descriptors: *Legal aspects, *Watersupply, *Coal, *Transportation, Legislation, State governments, Environmental effects, Navigable waters, Watershed management, Judicial decisions, Political constraints.

Coal slurry pipelines offer a number of advantages today. Coal and water are the two basic ingredients for a coal slurry pipeline. Problems of legal availability of water is the critical issue with respect to coal slurry pipelines. While the areas where coal originates seek expanded coal usage, they are hostile to exporting water to transport the coal. Legal and political problems arise from the diversion of water from one watershed to coal slurry pipelines. The reserved rights doctrine of water law and its amenability to coal slurry pipeline use are considered. Two concepts limit the doctrine's use for coal slurry pipeline purposes. Other sources of water supply are navigable waters, federal reclamation projects or other multipurpose federal projects. Another key issue in the feasibility of a coal slurry pipeline is the crossing of railroad right-of-ways. There is proposed federal legislation that would grant the right of eminent domain to pipelines. Coal slurry pipelines should be considered. (Daniels-Florida)

THE COASTAL ZONE MANAGEMENT ACT AND ITS POTENTIAL IMPACTS ON COASTAL DEPENDENT ENERGY DEVELOPMENT,
McCutchen, Black, Verleger and Shea, Los Angeles, CA.
H. J. Privett.
Natural Resources Lawyer, Vol 11, No 3, p 455-505, 1979.

Descriptors: *Coasts, *Shore protection, *Land use, Management, Regulations, State government, Federal government, Programs, Legal aspects, Resource development, Legislation.

The effect of the 1972 Coastal Zone Management Act (Act) on the development and content of state coastal management programs is analyzed. Prior to their approval, it is important that state programs comply with the Act. Interim final regulations, published on March 1, 1978, revised and superseded several prior regulations regarding development and approval of state coastal management programs. The more significant aspects of the new regulations are discussed in an issue by issue analysis of the Act's procedural and substantive requirements. Two novel concepts of general application are introduced by the regulations. First, a 'refinement' procedure exempts procedural changes to approved programs from the requirements of the Act which apply to program amendments. Second, states are authorized to include unenforceable enhancement policies in their management programs. The second concept runs directly counter to the requirement that programs be enforceable. The procedural requirements relate to program development, design, adoption and implementation. The substantive requirements include specific provisions that state programs must contain. The Twelve major substantive requirements are set forth and discussed. (Daniels-Florida)

MARICULTURE, THE LAW OF THE CONTINENTAL SHELF AND OFFSHORE OIL RECOVERY: A TECHNOLOGY AFFECTED BY A BODY OF LAW EFFECTED BY A TECHNOLOGY,
M. E. Shirley.
Natural Resources Lawyer, Vol 11, No 4, p 725-753, 1979.

Descriptors: *Marine fisheries, *Continental shelf, *Aquaculture, *Law of the Sea, Technology, Oceans, Oil platforms, Marine animals, Fishing, Fish farming, National seashores, Oceanography.

Recent developments in offshore oil and gas technology and deep ocean mining have led to the necessity for reviewing and perhaps redrafting various aspects of the law of the sea. In order to bring a higher degree of rationality to government policy-making with regard to these developments, there is a need for closer interaction between science, technology and law. Topics explored in this article are: (1) the impact of the technology of offshore oil recovery upon the law of the continental shelf; (2) the development of the law of the sea to date and short-term forecasts; and (3) the impact of the law thus developed upon mariculture, as yet a relatively unrelated technology. The legal boundaries established in response to the growth of offshore oil recovery will determine the legal regime in which the infant industry of mariculture will develop its technology. Further analyzed are legal developments in coastal laws and their application to the formulation of new ocean-use rules and regulations governing manmade mariculture stations at sea. (Schwerer-Florida)

DEVELOPMENT OF THE RIO GRANDE COMPACT OF 1938,
R. A. Hill.
Natural Resources Journal, Vol 14, No 2, p 163-200, April 1974.

Descriptors: *Rio Grande River, *Water supply development, *Water contracts, Water supply, Water allocation, Water policy, Irrigation water, Allotments, Water users, *Interstate compacts, Colorado, New Mexico, Texas.

The 1938 Rio Grande Compact (1938 Compact) was entered into by Colorado, New Mexico and Texas. It was designed to provide maximum beneficial use of water in the Rio Grande basin above Fort Quitman, Texas, without impairing any previous supplies beneficially used. The history of the 1938 Compact is reviewed. Long before 1938, it was obvious that quantities of water obtainable for the Rio Grande were not sufficient to meet the area's irrigation demands. In 1926, the federal government undertook a study to develop a program to rehabilitate the Middle Rio Grande Valley. The reaction to this program was adverse by water users in Colorado, Texas, and New Mexico who feared any expansion of upstream use would impair their water supply. This led to the Rio Grande Compact of 1929. The 1938 Compact was an expansion of the 1929 Compact. The provisions of the 1938 Compact are analyzed, including a clarification of its meaning and intent. (Daniels-Florida)

USE OF THE WATERS OF THE COLORADO RIVER IN MEXICO: PERTINENT TECHNICAL COMMENTARIES,
I. L. Cabrera.
Natural Resources Journal, Vol 15, No 1, p 27-34, January 1975.

Descriptors: *Colorado River basin, *Water quality, *Salinity, *Mexico, *United States, Colorado River, Colorado River Compact, Treaties, Water resources, Water users, Agriculture, River basins, Riparian waters.

The Colorado River Basin spreads over both Mexico and the United States. A valley was formed by the river, of which the two countries each own half. It is prime agricultural land and each country uses the river to irrigate it. The United States gained control of the river and a treaty was signed in order to clearly fix Mexico's rights. Although this treaty guarantees a certain quantity of water to Mexico, it says nothing of quality. A salinity problem developed and highly saline groundwater was being pumped to Mexico as part of its allotment. The United States argued no violation of the treaty, but the treaty refers to the water used by each country as being equal. The United States argued that the situation was a result of a reasonable use of the waters within its territory, but the assumptions it made were not totally sound. After much negotiation, the United States promised to take measures to guarantee that the waters turned over to Mexico would be of permanently acceptable quality. (Tabano-Florida)

Natural Resources Journal, Vol 15, No 1, p 83-107, January 1975.

Descriptors: *Colorado River, *Salinity, *Mexico, *United States, International law, Water users, Irrigation water, Water quality, Water delivery, Governmental interrelations, Treaties, International waters.

The most troublesome aspects of the 1973 Colorado River Salinity Agreement (Agreement) and their ramifications for United States (U.S.) - Mexican relations and international law are examined. The river is of major economic importance to Mexico as it provides irrigation for agriculture in nearby valleys. An historical overview is presented of the river's use and the dealings between the two countries concerning its use. The genesis of the Agreement is examined. All the Agreement accomplishes is that the U.S. has a duty to deliver water of usable quality across the border. Despite confidence in the Agreement, there is no absolute definition of the allowable salinity level. There are also potential delivery problems to the San Luis Valley. There also may not be sufficient water to allow for all consumptive uses. The U.S. has offered nonreimbursable assistance for improvement and rehabilitation. Implementing legislation for the Agreement is considered. The Agreement is insufficient to avoid future controversy and a new treaty may need to be negotiated. (Tabano-Florida)

FISHERY CONSERVATION AND THE LAW OF THE SEA.
In: Proceedings of the Seventy-Second Annual Meeting, April 27-29, 1978, Washington, D.C. the American Society of International Law, p 321-343, 1978. ASIL, Washington, D.C.

Descriptors: *Law of the Sea, *Fish management, *Fish conservation, *Marine fisheries, Fish, International commissions, United Nations, Oceans, Fishing, Resources, Marine animals, Fisheries.

The United Nations Conference on the Law of the Sea has had limited success, despite two separate redraftings of its negotiating text. The Law of the Sea negotiations began several years ago with early emphasis on developing an acceptable international regime for fisheries conservation and management. The present negotiating text being used by the Conference gives each coastal state the right to manage and the obligation to conserve all the fish within a 200 mile economic zone. Establishment of United States control over its 200 mile fisheries area and similar action by many other coastal states has produced several problems. One difficulty has been with management of fishermen, both domestic and foreign. In 1976, Congress passed the Fishery Conservation and Management Act, giving the United States jurisdiction over all fish except tuna within its 200 mile economic zone. The Law of the Sea negotiations have provided a good framework for establishing regimes for fisheries conservation and management throughout the world. In addition lesser known resources, such as krill, may become the world's major fishery product. Studies for the exploitation and management of these resources should be undertaken in the future. A THEORETICAL ANALYSIS OF MINUTE 242,
New Mexico Univ., Albuquerque.
A. V. Kneese.
Natural Resources Journal, Vol 15, No 1, p 135-140, January 1975.

Descriptors: *Colorado River, *Salinity, *International waters, *Economic justification, International law, Economics, Governmental interrelations, Benefit sharing, Compensation, Water law, United States, Mexico.

The 1973 Colorado River Salinity Agreement is examined from an economic point of view. Four types of situations are presented which seem to characterize most cases involving international watercourses: (1) pure 'public goods' situations; (2) situations where upstream development provides benefits for both upstream and downstream countries; (3) the 'common property' situation; and (4) the 'zero sum situation'. The situation between the United States and Mexico is viewed as a 'zero sum' situation. This means that the water use by an upstream country diminishes the benefit to the downstream country, but the downstream user cannot retaliate in any direct way. In this situation, there can be no basis for agreement unless the victum country compensates the damaging country for costs incurred to reduce the damage. In this Agreement, however, the United States has agreed to pay the entire cost of mitigating the damage. Extraneous considerations must have been dominant in the decision, most notably the projection of a proper national image. This Agreement will not be the final word on the matter. (Tabano-Florida)

NEW MEXICO'S NATIONAL FORESTS AND THE IMPLIED RESERVATION DOCTRINE,
R. A. Marquez.
Natural Resources Journal, Vol 16, No 4, p 975-1002, October 1976.

Descriptors: *New Mexico, *Reservation doctrine, *Federal-state water rights conflicts, Judicial decisions, Forest management, Federal government, State government, Forests, Water rights, Administrative agencies, Prior appropriation.

There is a great federal-state conflict over the waters of the western United States. The source of conflict is the implied reservation doctrine which vests water rights in the federal government. The principal federal agency affecting New Mexico water rights is the Forest Service. The New Mexico State Engineer has steadily attacked the implied reservation rights claimed for New Mexico's National Forests. Both the State Engineer and the Forest Service claim a better right to use of the water, an increasingly scarce and valuable resource. A reserved federal water right has certain characteristics incompatible with state appropriation water law: (1) created without diversion or beneficial use; (2) unlost by nonuse; (3) priority-dated from the time of land withdrawal; and (4) measured by the amount of water necessary to satisfy the purposes for which the land has been withdrawn. Perhaps the doctrine's foremost problem is that of compensation. Most of the recommended federal legislation supports some type of compensation for impaired vested uses. (Wilson-Florida)

THE PATRIMONIAL SEA TO THE RESCUE OF THE GULF OF CALIFORNIA,
Universidad Nacional Autonoma de Mexico, Mexico City.
A. Szekely.
Natural Resources Journal, Vol 17, No 1, p 113-122, January 1977.

Descriptors: *Mexico, *Boundary disputes, *Gulfs, *International law, History, Law of the Sea, United States, Bays, Internal waters, International law, Legal aspects, Fishing, *Gulf of California.

During the last twenty years, several sectors of the Mexican community have alleged that the Gulf of California should be regarded as part of the Mexican territory. They have demanded that the government proceed, in the national interest, to close the Gulf. To substantiate these allegations and demands, they have invoked a legal, historic title supported by international law. In 1975, Mexico announced its definite plans to claim a two-hundred mile patrimonial sea or exclusive economic zone. This measure would have the logical and immediate effect of closing the Gulf of California to foreign fishermen. Under the provisions of the 1958 Geneva Convention, the Gulf of California is considered a geographical bay. Because the imaginary line drawn across the mouth of the Gulf measures approximately 110 miles, it cannot be regarded as internal waters of Mexico. Many Mexican jurists have argued that the Gulf was a Mexican 'historic bay'. Mexico's claim to the Gulf of California has actually been affected more by internal differences than by external influences. (Wilson-Florida)

THE PRESSURE FOR SHORELINE DEVELOPMENT: SPATIAL CONCEPTS IN REVIEW,
Ottawa Univ. (Ontario).
P. Harrison.
Coastal Zone Management Journal, Vol 3, No 3, p 319-322, 1977.

Descriptors: *Washington, *Public access, *Coasts, *Shore protection, Public benefits, Sea shores, Ecosystems, Resources development, Environmental effects, Ecology, Developed waters.

The complex structure of the coastal ecological system creates certain delicate subzones that have little if any regenerative capacity. Shallow, easily stratefied waters are less capable of coping with the impact of human development than more open turbulent waters. The calibration of carrying capacities of coastal systems is a difficult and as yet unclear process. Certain generalizations can be made. First, high-density, nodul development is generally unsuited to coastal areas of low carrying capacity and to areas of high capacity extremely limited in extent. Second, low-density or spread development would seem to be a significant underutilization of high carrying capacity areas. Spread development tends to preempt public access, by closing off shoreline use to all except a small group of owners. Public access is related to environmental carrying capacity. Excessive access to ecologically delicate areas is perhaps the best way to promote environmental degradation. (Wilson-Florida)

A GENERAL INTERNATIONAL LAW DOCTRINE FOR SEABED REGIMES,
Syracuse Univ., NY.

L. F. E. Goldie.
International Lawyer (A.B.A.) Vol 7, No 4, p 796-824, October 1973.

Descriptors: *Oceans, *Mining, *Beds under water, *Law of the Sea, International law, Underwater, Regime, Exploitation, Governments, United Nations, Common law, Claims.

Various proposals for seabed regimes, methods to manage international seabeds are compared with general international law governing deep seabed mining activities. Decisional law is examined regarding concepts of possessory rights under international law. Cases from Anglo-American common law illustrate the misleading effects caused by stressing the need for a specific, immediate and active control to establish possession. The common law development of miner's rights is discussed, focusing on the practices in the American west. Similar practices arising in international law are appraised. The concept of acquired rights is discussed. The United Nations' Moratorium resolution and common heritage clause are examined in relation to general international law. The relations of seabed - exploitating enterprises operating under laws of different states are examined, as are the relations between two or more American enterprises in international seas. (Daniels-Florida)

INTERNATIONAL CONTROL OF DUMPING AT SEA,
G. J. Timagenis.
Anglo-American Law Review, Vol 2, No 2, p 157-187, April-June 1973.

Descriptors: *Law of the Sea, *Waste disposal, *International commissions, International law, International waters, Internal water, Wastes, Water pollution control, Coasts, Legal aspects, Oceans.

The conventional rules, judicial precedents, and general principles of international law of the sea are clearly inadequate to meet the problems raised by waste disposal at sea. Traditional international law has dealt with waste disposal in two contexts: (1) territorial sea and internal waters; and (2) high seas and contiguous zones. States have sovereignty in the territorial sea areas, subject to the rules of international law. A state has the right to dispose of waste material in the high seas, 'with reasonable regard to the interests of other states.' The 1969 International Legal Conference on Marine Pollution Damage in Brussels adopted a resolution recommending that work be intensified on all aspects of pollution other than oil. The 1972 United Nations Conference on the Human Environment in Stockholh adopted recommendations for future action for the preservation and improvement of the environment. The first regional convention dealing with dumping was signed in Oslo in 1972 by twelve European countries. The United States initiated efforts in 1971 for an instrument to control ocean dumping. (Wilson-Florida)

A COMPREHENSIVE OIL POLLUTION LIABILITY AND COMPENSATION ACT: HOW SUPER IS THE 'SUPER FUND',
S. J. Tresidder.
Detroit College of Law Review, Vol 1978, No 2, p 277-306, Summer 1978.

Descriptors: *Oil spills, *Compensation, *Oil pollution, *Damages, Economic impact, Water pollution effects, Economic justification, Legislation, International law, Water law, Water pollution control, Oil industry.

In recent years, oil spills have received increasing attention. Massive spills have caused extensive damage and cost millions of dollars. Proposed federal legislation provides for a comprehensive oil pollution liability and compensation program. Rules governing traditional means of compensation for oil spill damage are found in federal maritime statutory and common law. The limitations of traditional recovery methods has led to the proposed statutory modifications. One of the primary purposes of the federal statutory changes has been to alleviate the problems of funding for rapid removal of spilled oil. Oil spill compensation systems have been affected by federal and state legislation, international law, and voluntary agreements. The so-called 'Super Fund' legislation, currently pending in Congress, would create a complete system of oil spill compensation for cleanup costs, damages to third parties, and environmental injury. The 'Super Fund' drawback is its strong potential for losing money. The importance of protecting United States water resources outweighs any potential cost problems. (Wilson-Florida)

LEGAL SYSTEM REQUIREMENTS TO CONTROL AND FACILITATE WATER AUGMENTATION IN THE WESTERN UNITED STATES,
K. S. Danielson, G. W. Sherk, Jr., and L. O. Grant.
The Denver Journal of International Law and Policy, Vol 6, Special Issue, p 511-525, 1976.

Descriptors: *Colorado, *Artificial precipitation, *Water yield improvement, *Weather modification, Legal aspects, State jurisdiction, Appropriation, Atmosphere, Water resources, Water resources development, Watershed management, Water rights.

Problems of water augmentation are twofold. First is the complexity of the weather modification aspect of water augmentation. These fundamental problems are environmental, social, and legal. Second, legal uncertainties concerning water augmentation will necessarily involve the issue of water rights. The different approaches to water ownership in the western United States is examined, with emphasis on a recent Supreme Court of Colorado decision to the question of the ownership of water produced by water augmentation activities. Water augmentation activities include weather modification and watershed management techniques. These techniques will require legal system responses to protect both water rights holders and the general populace. Areas examined regarding legal system requirements include: state claims to water, water for weather modification, water from augmentation, and artificial water. Possible legal system responses are suggested and the legal and political obstacles are analyzed. (Schwerer-Florida)

JUDICIAL REVIEW UNDER FEDERAL POLLUTION LAWS,
Chicago Univ., IL.
D. P. Currie.
Iowa Law Review, Vol 62, No 5, p 1221-1280, June 1977.

Descriptors: *Federal water pollution control act, *Water quality standards, *Judicial decisions, Administrative agencies, Clean Air Act, Legislation, Legal aspects, Permits, Federal jurisdiction, Reviews, Water pollution control.

In an effort to remedy uncertainties in their predecessor statutes, both the Clean Air Act (CAA) and the federal Water Pollution Control Act (FWPCA) were amended in the early 1970's to include explicit provisions for judicial review. Experience has shown that uncertainties persist; the time has come for legislative re-examination. Both statutes are administered by the federal Environmental Protection Agency. Both are extraordinarily complicated. The heart of the FWPCA is a permit system whose administration may be delegated to the states under specified conditions. Section 509(b) of the FWPCA provides for judicial review of certain federal standards and limitations regulating pollution discharges and review of federal action on permits. The FWPCA is silent about judicial review regarding regulation of sewage discharge from vessels and oil discharge, of the decision to allow additional time to comply with emission control standards. The FWPCA and CAA accord with the modern trend allowing direct appellate review of informal rulemaking. Additional review problems occur regarding jurisdiction and standing, due to certain inconsistent, incomplete or ambiguous provisions. (Wilson-Florida)

STATE AND LOCAL WETLANDS REGULATION IN THE COURTS: CONSTITUTIONAL PROBLEMS ON THE WANE,
S. M. McCraw.
Harvard Environmental Law Review, Vol 1, p 496-514, 1976.

Descriptors: *Wetlands, *Constitutional law, *Land use, Judicial decisions, Legal aspects, Legislation, Regulation, State governments, Ecology, Water law, Economic justification.

Two recent decisions represent emerging judicial acceptance of state wetlands regulation. Plaintiffs in both cases attacked the constitutionality of state wetlands statutes on the grounds that they allowed a taking of private property without just compensation. The two decisions are valuable precedents for upholding wetlands regulation based on reasoning that recognizes the ecological crisis caused by unchecked wetlands development. These two cases, in conjunction with other recent wetlands decisions, indicate potential strategies for legislators and litigants concerned with wetlands protection. A review of recent wetlands cases demonstrates the desirability of drafting wetlands regulations expecting future court challenges. The most important feature of a statute or ordinance in this regard is an introductory statement recognizing the economic value of unaltered wetlands, wetlands ecological functions, and their interrelation with other environmental elements. Added to this introductory statement should be a declaration of state policy to place wetlands regulation under state police power. (Wilson-Florida)

COASTAL ZONE MANAGEMENT AND STATE-LOCAL RELATIONS UNDER THE LOUISIANA CONSTITUTION OF 1974,
Washington, Univ., Seattle.
M. J. Hershman, and M. M. Mistric.
Loyola Law Review, Vol 22, No 1, p 273-300, Winter 1975-76.

Descriptors: *Louisiana, *Coastal marshes, *Shore protection, *Constitutional law, State governments, Estuaries, Coasts, Legal aspects, Legislation, Administrative agencies, Federal project policy, Local governments.

Conservation of Louisiana's extensive coastal marshes and estuaries has been receiving increased attention by the Louisiana legislature in the past six years. In 1974, the Governor designated the State Planning Office to receive the first of three annual planning grants, under the 1972 federal Coastal Zone Management Act, to develop a state coastal management program. With the adoption of the 1974 Louisiana Constitution, which provides for increased autonomy of local government from the state legislature, certain local government leaders challenged the state's power to adopt a coastal management program which is binding on home rule charter governments. There are three articles in the 1974 Constitution which relate to the state's power to implement coastal zone management (CZM) legislation. Article III, Section 1 vests in the state legislature all legislative power not specifically prohibited by the Constitution. Article XIX, Section 18, provides that the police power shall never be abridged. Article IX, Section 1, provides that state natural resources shall be protected by the state legislation. These provisions arguably answer local government officials seeking local insulation from state CZM programs. (Wilson-Florida)

ENVIRONMENTAL LAW,
Jones, Walker, Waechter, Poitevent, Carrere and Denegre, New Orleans, LA.
S. O. Buckley, III.
Loyola Law Review, Vol 24, No 3, p 341-359, Summer 1978.

Descriptors: *Judicial decisions, *Federal Water Pollution Control Act, *Administrative agencies,

Legislation, Clean Air Act, Federal government, Federal jurisdiction, Legal aspects, Water pollution control, Environmental control, Water quality.

The decisions rendered by the Fifth Circuit during the 1977-78 term, reflect the growth and evolution of federal environmental legislation. In recent years, the vast majority of environmental issues have been decided under the 1969 National Environmental Policy Act (NEPA). The NEPA preceded the plethora of specific federal legislation that now covers air, water, solid waste disposal, and other activities. The three NEPA decisions rendered by the Fifth Circuit involved an initial federal agency determination that an environmental impact statement was not required. The Fifth Circuit also analyzed four cases involving the Federal Water Pollution Control Act and amendments thereto. These cases covered the entire spectrum of federal Environmental Protection Agency (EPA) authority from the agencies permit authority to its enforcement responsiblity once permits have been granted. In general, these cases demonstrated a tendency of the Fifth Circuit to defer to the EPA's interpretation of its authority and responsibility under the FWPCA. (Wilson-Florida)

ADMINISTRATIVE WATER RIGHTS INSPECTIONS IN CALIFORNIA,
W. D. Cunningham, and S. J. Imperati.
University of California, Davis, Law Review, Vol 12, No 1, p 105-124, March 1979.

Descriptors: *Water rights, *Inspection, *California, Legal aspects, Water resources, Water demand, Administrative agencies, Regulation, Appropriation, Legislation, Water law.

The ability to enter on private property to conduct water rights inspections is essential to the proper administration of California's water rights scheme. Without it, the State Water Resources Control Board would be unable to perform its statutory duties. The Board's Division of Water Rights receives much voluntary cooperation from most water rights holders. A problem may arise when water rights holders deny Board inspectors access to their private property. Such refusal raises several questions regarding the legality of any subsequent Board entry: (1) whether the Board has the power to enter and make nonconsensual water rights inspections; (2) whether the Board can make these inspections without an administrative inspection warrant; and (3) whether the Board has the authority under the California Code of Civil Procedure to obtain an inspection warrant if one is required. Although California courts have yet to address any of these questions, they cannot avoid dealing with them in the near future. (Wilson-Florida)

CONVENTION ON THE PREVENTION OF MARINE POLLUTION BY DUMPING OF WASTES AND OTHER MATTER.
Law and Policy in International Business, Vol 6, No 2, p 575-586, Spring 1974.

Descriptors: *International law, *Waste disposal, *Law of the Sea, *International waters, Wastes, Water pollution, Water pollution control, Treaties, Political aspects, Pollution abatement, Oceans.

Ocean dumping is not presently a serious problem, but will be in the near future. Because of this threat, the United States submitted a draft convention to the Intergovernmental Working Group on Marine Pollution. The convention is designed to improve the marine environment's quality by prohibiting the dumping of hazardous substances and by regulating the dumping of potentially dangerous materials. Other sources of marine pollution are left to later conventions. The problems and advantages of dealing with marine pollution on a piecemeal basis are discussed. The convention's effectiveness in preventing marine pollution is explored. The effectiveness is hard to predict, dependent on a variety of factors. The most serious shortcoming of the convention is the lack of an effective international enforcement mechanism. The economic effects of the convention are briefly examined. Although the terms of the convention are relatively weak, it is a first step toward the international control of marine pollution. (Daniels-Florida)

LAW OF THE SEA: ITS IMPACT ON THE INTERNATIONAL ENERGY CRISIS,
Ad Hoc Committee on Mineral Resources Beneath the Seas, Washington, DC.
L. W. Finlay, and M. S. McKnight.
Law and Policy in International Business, Vol 6, No 3, p 639-676, Summer 1974.

Descriptors: *Law of the Sea, *International law, *Energy, *Oil industry, Oil, United Nations, Conferences, Navigation, Environmental effects, Beds under water, International Commissions.

The Third United Nations Conference on the Law of the Sea convened in Caracas on June 20, 1974. The delegates were fully cognizant of the enormous impact of current energy shortages arising out of the Arab oil embargo. The most important topics discussed at the Conference affecting the energy crisis were: (1) the breadth of the territorial sea and the related question of the right of unimpeded passage through straits and archipelagic waters used for international navigation; (2) coastal state jurisdiction over seabed resources beyond the territorial sea; (3) deepwater ports; (4) preservation of the marine environment and liability for damages resulting from its use; (5) the regime for the international seabed area; and (6) activities pending the entry into force of a possible treaty. An equitable resolution of the procedural issues facing the Conference will be a critical determinant of its success, as will be the objectivity of the individual conferences in resolving the substantive issues. (Wilson-Florida)

FISHERIES JURISDICTION-UNITED STATES FISHERY CONSERVATION AND MANAGEMENT ACT OF 1976, PUBLIC LAW 94-265, 94TH CONGRESS, H.R. 200,
J. Dorsey.
Harvard International Law Journal, Vol 18, No 1, p 177-185, Winter 1977.

Descriptors: *Fish management, *Fish conservation, *Marine fisheries, *Law of the Sea, United States, International law, United Nations, Fisheries, Legislation, Conferences, Anadromous fish, Jurisdiction.

On the authority of the 1976 Fishery Conservation and Management Act (Act), the United States (U.S.) will extend its fishery jurisdiction to 200 miles from the baseline from which the territorial sea is measured. The extension of the exclusive fishery jurisdiction to 200 miles is part of a comprehensive plan to establish effective conservation and management of U.S. marine resources. The plan is designed to first conserve and subsequently increase the fish yield and marine life in the exclusive fishery zone. The negotiating team from the executive branch which represented the U.S. at the Third Conference on the Law of the Sea led the fight in Congress against the unilateral extension over fisheries jurisdiction. Their principle concern was the effect the Act would have on U.S. negotiating leverage at the Conference. The Act does seem to be in accord with the developments at the Conference, best reflected by the Revised Single Negotiating Text. President Ford expressed his concern as to whether the U.S. has the right under international law to control anadromous species outside its own contiguous zone. (Wilson-Florida)

UNITED STATES OCEANS POLICY: PERSPECTIVE 1974,
Louisiana State Univ. Law Center, Baton Rouge.
H. G. Knight.
Notre Dame Lawyer, Vol 49, No 2, p 241-275, December 1973.

Descriptors: *Law of the Sea, *Oceans, *United States, *Resource allocation, United Nations, International law, Beds under water, Foreign countries, Fisheries, International commissions, Research and Development, Environmental control.

The United States (U.S.) has developed elements of a national oceans policy which it seeks to implement through agreements to be reached at the Third United Nations Conference on the Law of the Sea. There are five basic subject matter areas which this nation is presently emphasizing through its policy proposals: (1) the regime which will govern exploration for and exploitation of the non-living resources of the seabed and subsoil. United States policy regarding coastal state jurisdiction over non-living seabed resources supports the economic resource zone concept. On the question of resources beyond national jurisdiction, U.S. policy favors an international regime; (2) the management of living marine resources. The U.S. acknowledges the state right to extend its fisheries jurisdiction; (3) Territorial Sea-U.S. policy has reflected a desire for a free flow of commerce; (4) Scientific Research - U.S. policy favors freedom of research in the oceans; and (5) Protection of Marine Environment - the U.S. has pressed for international agreements to handle various pollution problems. (Wilson-Florida)
W80-05004

FEDERAL CONTROL OF WETLANDS: THE EFFECTIVENESS OF CORPS' REGULATIONS UNDER SECTION 404 OF THE FWPCA,
J. M. Frasca.
Notre Dame Lawyer, Vol 51, No 3, p 505-521, February 1976.

Descriptors: *Wetlands, *Dredging, *Federal Water Pollution Control Act, Water pollution control, Administrative agencies, Judicial decisions, Jurisdiction, State governments, Legislation, Agriculture, Regulation.

Section 404 of the Federal Water Pollution Control Act Amendments (FWPCA) gives the United States (U.S.) Army Corps of Engineers (Corps) primary authority to regulate dredge and fill operations in 'navigable waters' of the U.S. Section 502(7) of the FWPCA defines the term 'navigable waters' as waters of the U.S., including the territorial seas. As late as April 1975, however, the Corps' regulations restricted its authority to only those waters subject to inundation by tidal waters and susceptible to interstate commerce. In 1975, the federal District Court for the District of Columbia decided the Corps' regulations were in derogation of its statutory duties. The Corps published new regulations which dramatically expanded that agency's regulatory powers. The most substantial criticism of the Corps' section 404 jurisdiction is based on its anticipated adverse impact on agriculture. Moreover, section 404 of the FWPCA was not initially enacted for the specific purpose of wetlands control. The Federal Coastal Zone Management Act has several advantages over FWPCA in this regard. Another serious deficiency of section 404 in wetlands control is the limited state participation. (Wilson-Florida)

DAM POLICY IN MASSACHUSETTS,
Massachusetts Univ., Amherst. Water Resources Research Center.
E. R. Kaynor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182835, Price codes: A06 in paper copy, A01 in microfiche. Publication No 110, 1979. 95 p, 1 Fig, 2 Tab, 48 Ref, 2 Append. OWRT-A-113-MASS(1), 14-34-001-8023.

Descriptors: *Dams, *Dam policy, *Massachusetts, *Hydroelectric power, *Riparian rights, *Prior appropriation, Dam safety, Policy, Legal aspects, Governments, Decision making, Jurisdiction.

Massachusetts law contains detailed procedures for compensating those adversely affected by dams. However, court decisions have tended to absolve dam owners from culpability for damages. Massa-

husetts preaches riparian doctrine but practices rior appropriation doctrine. Massachusetts law lso requires dam safety inspections, but inspec- ons seldom occur because there are no funds. ecently, Massachusetts policy has strongly en- ouraged hydroelectric energy production with ery little success in spite of sizeable state and ederal incentives. Survey research reveals that art of the problem is that neither governmental fficials nor the public at large are very interested n dams. There is little knowledge of how to roceed to make beneficial use of dams. There is lso confusion over which governmental level has urisdiction. The Commerce Clause together with iberal definitions of navigability tend to favor ederal jurisdiction, but federal officials try to en- ourage state decision-making except where dams re built or licensed by federal agencies. This eport recommends creation of a Dam Policy De- iberation Committee to further investigate dam unctions and malfunctions in Massachusetts, and o recommend policy changes. It also recommends he creation of a state agency empowered to pur- hase unused, underused, or misused dams for de- velopment according to plans for maximum benefi- cial development. (Godfrey-Mass)

EPA CONSOLIDATION OF PERMITS PROPOSAL-REGULATORY WORKHORSE OR BUREAUCRATIC NIGHTMARE,
Water Pollution Control Federation, Washington, DC.
T. Kish.
Journal Water Pollution Control Federation, Vol 52, No 2, p 229-234, February 1980. 1 Fig.

Descriptors: *Permits, *Regulation, *Waste disposal, Benefits, State governments, Water pollution control, Legislation, Environmental Protection Agency, Administrative agencies.

This paper discussed the benefits and criticisms of proposed regulations aimed at consolidating and unifying procedures and requirements for EPA-administered permit programs to reduce ubiquitous delays. The five programs covered by the proposed regulations are: The Hazardous Waste Management Program; the Underground Injection Control Program; the National Pollutant Discharge Elimination System; the Dredge or Fill Program; and the Prevention of Significant Deterioration Program. Advantages include: environmental benefit, regulatory burden reductions, institutional and resource benefits, and public participation benefits. The proposed single permit form would include a general information section followed by separate sections for each EPA program except the Dredge or Fill Program. The major criticisms, extrapolated from over 5000 pages of written comments, are divided into general, program definitions and basic program requirements, state program requirements, procedures to be followed for making permit decisions, and the consolidated permit form. EPA contends that consolidated permits will provide for a more uniform, comprehensive, and consistent approach to EPA-administered permitting. Hopefully, it will also provide the states with a more uniform and accessible procedure for requesting and assuming permitting responsibility. (Purdin-NWWA)

BLACK-LISTING THE POLLUTERS,
Environmental Protection Agency, Philadelphia, PA. Region III.
R. W. Martin, Jr.
Federal Bar Journal, Vol 36, No 1-2,. p 17-29, Winter-Spring 1977.

Descriptors: *Administrative agencies, *Pollution abatement, *Government finance, *Federal Water Pollution Control Act, Administrative decisions, Facilities, Environmental control, Government supports, Administration, Regulation, Federal government.

Pursuant to Section 306 of the Clean Air Act and Section 508 of the Federal Water Pollution Control Act, the Federal Environmental Protection Agency (EPA) can indicate to violators that federal funding may be withheld from their facilities unless there is compliance with the agency's regulations and guidelines. There are six bases upon which a facility may be listed for noncompliance, all indicating some type of court action having been taken against it. A facility might also be listed as ineligible under conditions which do not include a conviction. There is some dispute over this due to unclear legislative history, but the EPA sees its actions as justified. The Office of Federal Activities administers the program. A breakdown of responsibilities within the EPA and the procedure for listing are also set out. The program could be of real value if the EPA moved to ensure that all products come from facilities in compliance. 'National goals clauses' could be put in contracts between the government and facilities to implement this. The procedure has been used twice as of November 1976 against unconvicted violators, and this could be an effective leverage for speedy compliance. (Tabano-Florida)

STATE CONTROL OF OIL POLLUTION: LEGISLATING IN THE TWILIGHT ZONE,
M. Lipeles.
Harvard Environmental Law Review, Vol 1, p 431-457, 1976.

Descriptors: *Oil pollution, *Oil spills, *Federal government, *State governments, Legislation, Constitutional law, Constraints, Compensation, Legal aspects, Cost allocation, Remedies.

Existing federal statutes and common law remedies do not satisfactorily promote the three basic objectives of oil spill liability schemes. As a result, several coastal states have enacted or are considering proposals for oil spill liability and compensation laws. Parallel state and federal developments highlight the oil spill debates most controversial issue of whether the federal government should preempt state authority. This issue raises several questions which should be addressed to resolve the preemption controversy: (1) what constraints does the Constitution impose on state authority over oil spills; (2) what guidelines regarding state action has Congress enacted; (3) what states have done or seek to do regarding spill liability and compensation; and (4) what would be a constitutionally permissable and environmentally sound policy governing state and federal authority. The constitutional, statutory and judicial background to these questions are described. The focus is on current developments at the federal and state levels. It is concluded that Congress should not preempt state oil spill schemes. (Daniels-Florida)

CALIFORNIA'S TIDELANDS TRUST FOR MODIFIABLE PUBLIC PURPOSES,
T. H. Ziemann.
Loyola University of Los Angeles Law Review, Vol 6, No 3, p 485-525, September 1973.

Descriptors: *California, *Public rights, *Seashores, *Shore protection, Preservation, Land management, Environmental effects, Coasts, Ownership of beds, Public lands, Navigation, Fishing, *Tidelands.

The tidelands, that portion of the shore covered and uncovered by the daily ebb and flow of the tides, are an important, if not the key, area of coastal zone land use. California's tidelands are encompassed by the tidelands trust doctrine. The state, as trustee of a public trust, protects public uses in the foreshore. The public trust concept in its traditional molding was inadequate to protect the public interest. In 1971 the California Supreme Court recognized the public's right to preserve the foreshore. The history of the tidelands trust doctrine is examined to discover whether the doctrine is flexible enough to meet the current requirements of the public interest in tidelands. The state has limitations on the choice of tideland allocation, either absolute or conditional. State ownership is necessary when the general welfare requires public use of the foreshore. There is a recognized need for a redefinition of the requirements of general welfare. The uses within California's tidelands can be modified, and implementation of environmentally-based public uses would best protect the public interest. (Daniels-Florida)

PUBLIC PARTICIPATION IN LOCAL LAND-USE PLANNING: CONCEPTS, MECHANISMS, STATE GUIDELINES AND THE COASTAL AREA MANAGEMENT ACT,
D. W. Ownes.
The North Carolina Law Review, Vol 53, No 5, p 975-1004, June 1975.

Descriptors: *North Carolina, *Land use, *Planning, *Public rights, Programs, Decision-making, State governments, Adoption of practices, Local governments, Legislation, Standards, Coasts, *Coastal Area Management Act.

The nature, extent and methodology of citizen participation in governmental planning and decision-making are important issues. Public participation should be given careful consideration in land use planning. North Carolina's 1974 Coastal Area Management Act (CAMA) contains provisions relating to public participation. However, the legislature made only perfunctury obeisance to the concept of public participation. The CAMA provisions and administrative proposals of the Coastal Resources Commission relating to public participation are discussed. The basic theories, definitions and issues involved in the concept of public participation are examined. There are at least three basic theories of citizen participation. Related to the choice of a theoretical basis for public participation is its meaning. Four basic definitional groupings are considered: citizen involvement, citizen influence, citizen power and citizen-government exchange. The mechanics and timing of public participation are discussed. Tools for public participation include: one-way output, one-way input, and interaction mechanisms. The requirements for public participation mandated by the CAMA are quite limited. Several recommendations to increase effective public participation are made. (Daniels-Florida)

THE EXTENT OF STATE OWNERSHIP OF SUBMERGED LANDS IN CALIFORNIA,
W. Arnone.
Hastings Law Journal, Vol 31, No 1, p 329-345, September 1979.

Descriptors: *California, *Boundaries(Property), *Ownership of beds, Judicial decisions, Boundary disputes, Legal aspects, Submerged lands act, Riparian rights, Public rights, Legislation, Navigable waters.

During 1970, the California Attorney General in conjunction with the California State Lands Commission initiated action to overturn 100 years of case and statutory law governing title to submerged lands in California. Statutory construction was generally that the state's ownership of these lands extended only to the low-water mark. The Attorney General asserted that state ownership of the lands beneath California non-tidal navigable waters extended to the high-water mark. This change in position has created uncertainty and confusion among the landholders potentially affected. The result has been a number of civil actions filed by landowners seeking judicial clarification of the extent of their landholdings. Until this issue is resolved conclusively, the property rights of all littoral and riparian landowners in California will remain in doubt. Several cases are now being heard at the appellate level. Both historically and legally the foundation for the state's claim is lacking. Therefore, judicial removal of this artificially created could upon title is imperative. (Wilson-Florida)

POLLUTION: INTERNATIONAL CONVENTIONS, FEDERAL AND STATE LEGISLATION,
J. J. Higgins.
Tulane Law Review, Vol 53, No 4, p 1328-1363, June 1979.

Descriptors: *Oil pollution, *Federal-state water rights conflicts, *International commissions, Oceans, International law, Oil spills, United Nations, Federal Water Pollution Control Act, State governments, Legislation, Ships.

The genesis of modern laws dealing with pollution of the oceans and littoral territories began in 1967 with the Torrey Canyon disaster. On the international level, oil pollution damage is covered by the Civil Liability Convention of the International Legal Conference, an agency of the United Nations. The Convention applies to ships carrying more than 2,000 tons of oil in bulk as cargo. The Convention covers oil pollution damage to the territory of a Contracting State. The Civil Liability Convention is supplemented by the Fund Convention. In the United States a party who suffers oil pollution damage may bring an action under common law and general principles of maritime law. The primary federal statute is the 1972 Federal Water Pollution Control Act (Act). The Act includes prohibitions against harmful discharges, requirements of evidence of financial responsibility, and provisions for penalties. Liability for oil pollution under state law depends on whether states are free to impose liability for such pollution. Questions have arisen whether state ocean pollution liability legislation unconstitutionally intrudes into an area of exclusive federal maritime jurisdiction or imposes a burden on interstate or foreign commerce. (Wilson-Florida)

FEDERAL WATER POLLUTION CONTROL ACT - THE FEDERAL GOVERNMENT'S EXCLUSIVE REMEDY FOR RECOUPMENT OF OIL SPILL CLEANUP COSTS,
R. T. Lemon, II.
Tulane Law Review, Vol 53, No 4, p 1421-1438, June 1979.

Descriptors: *Federal Water Pollution Control Act, *Oil spills, *Remedies, Oil pollution, Cleaning, Legislation, Judicial decisions, Environmental effects, Water pollution sources, Federal government.

The Federal Water Pollution Control Act (Act) was created to provide a national policy for the prevention, control and abatement of water pollution. One of the most serious threats to the waters of the United States is damage from oil spills. In addition to environmental damage, another effect of oil spills is the cleanup cost. The Act has provided a comprehensive plan designed to expedite oil pollution cleanup, and to establish a workable scheme for limiting liability for oil spill cleanup costs. Although other statutory and nonstatutory remedies exist concurrently with the Act, the federal government's exclusive remedy for reimbursement of cleanup costs is set forth in and limited by the Act. Although the Act does not state that it is the exclusive remedy, an examination of the Act's legislative history, of the statute's provisions and legislative character, and of the relevant case law indicate that the Act is the federal government's exclusive basis for recovery. (Wilson-Florida)

THE INTERNATIONAL REGIME FOR THE DEEP SEABED: PAST CONFLICTS AND PROPOSALS FOR PROGRESS,
Vanderbilt Univ., Nashville, TN. School of Law.
J. I. Charney.
Harvard International Law Journal, Vol 17, No 1, p 1-50, Winter 1976.

Descriptors: *Beds under water, *International commissions, *Law of the Sea, *Treaties, United Nations, International law, Conferences, International waters, Political aspects, Resources, Jurisdiction.

For the first time, virtually all nations of the world are seeking to establish an international organization to manage deep seabed resources. Nearly 150 nations participated in the second session of the Third United Nations Conference on the Law of the Sea. The principle product of that session was the Informal Single Negotiating Text (ISNT), which will form the basis for negotiations at the third session of the Law of the Sea Conference. Probably the most controversial part of the ISNT is that produced by the committee assigned to establish a regime for the management of seabed resources beyond the limits of national jurisdiction. Several compromise regimes have been suggested: (1) a phased regime; (2) a Tribunal with authority over the Seabed Authority; (3) open access for exploitation; and (4) modification of voting. All nations must give serious thought to the inadequacies present in the current First Committee texts and the available compromise solutions. (Wilson-Florida)

LAND USE CONTROLS IN COASTAL AREAS,
Kentucky Univ., Lexington
R. C. Ausness.
California Western Law Review, Vol 9, No 3, p 391-428, Spring 1973.

Descriptors: *Coastal marshes, *Coastal plains, *Land use, *Shore protection, Coasts, Environmental control, Legislation, Management, Water policy, Water pollution effects, Project planning.

Prolonged exploitation of coastal resources has caused extensive ecological harm. The coastal environment is acutely sensitive to human activities, like dredging, mining, and pollutant discharges. Estuarine areas have been particularly susceptible to harm from land development. Beach erosion is another adverse effect. A solution must include a wide range of regulatory devices, an administrative structure capable of effectively utilizing these enforcement tools, and a coherent public policy concerning the allocation of coastal zone resources. Any method of environmental control must take into account property rights in coastal areas. Congress enacted the Coastal Zone Management Act in 1972. This legislation seeks to encourage the development of comprehensive state management programs and the formulation of a national coastal zone policy. Governmental measures to protect the coastal environment are subject to a number of institutional and practical constraints, including commercial interests, inadequate state administrative resources, and due process requirement. Any effective implementation of a coastal zone management program must take into account these conflicting interests. (Wilson-Florida)

WILL THERE BE LAW AT SEA.
In: American Society of International Law: Proceedings of the Seventieth Annual Meeting, April 22-24, 1976, Washington, D.C., p 175-82, 1976. American Society of International Law, Washington, D.C.

Descriptors: *Law of the Sea, *International commissions, *International law, Negotiations, United Nations, Economics, Oceans, Foreign countries, Legal aspects, Jurisdiction.

The Law of the Sea negotiations raise a myriad of questions which deal with the deep seabed, 200-mile economic jurisdiction, the territorial sea and straits, scientific research, marine pollution, and dispute settlement. One question that will have to be resolved is which part of the deep seabed area will be open to exploitation. Furthermore, landbased producers fear that deep seabed mining would economically hurt them. The Informal Single Negotiating Text on the regime for straits used for international navigation was an attempt to find a compromise between those states that favored free transit and those that supported an innocent passage regime. In the exclusive economic zone, the central problem was how to harmonize other states' interests with those of the coastal state. The Single Negotiating Text imposed a general obligation on states to protect the marine environment. However, no real efforts have been made to deal with landbased pollution. A serious question remains as to the jurisdictional character of the 200-mile economic zone. The basic issue is whether an exclusive economic zone will take on the characteristics of a territorial sea. (Wilson-Florida)

INTERNATIONAL ENVIRONMENTAL PROTECTION: POLICY, LEGAL, AND TRADE ASPECTS.
In: American Society of International Law: Proceedings of the Seventy-First Annual Meeting, April 21-23, 1977, San Francisco, California, p 48-67, 1977. The American Society of International Law, Washington, D.C.

Descriptors: *International commissions, *Water pollution control, *Water pollution sources, *International law, Negotiations, Oceans, Water pollution, Environmental effects, Water law, Legal aspects, Water pollution effects.

The United Nations Conference on Human Environment in Stockholm in 1972 focused the attention of the international community on the issue of international environmental law. A principle achievement at Stockholm was the Declaration of Principles which set out principles of state responsibility for environmental damage. Since Stockholm, the attention has been mostly devoted to the ocean commons, including the effect of any new ocean regime on environmental aspects of ocean management. Other areas of concern include regulation of vessel source pollution, protection of living resources and transfrontier pollution problems. Transfrontier pollution includes disturbances that originate in one country, are transmitted through a shared natural resource, and effect another country or areas not under a specific national jurisdiction. A number of international bodies believe transfrontier pollution problems, to the extent possible, should be handled domestically. Countries should ensure foreign plaintiffs access to the same protection from environmental damage as is accorded their own inhabitants. National environmental measures with trade implications can take a number of forms either through regulations, taxes, or subsidies. (Wilson-Florida)

FLOOD CONTROL AND ARIZONA,
M. R. Rooney.
Law and the Social Order, Vol 1973, No 4, p 919-937, 1973.

Descriptors: *Arizona, *Flood control, *Flood plain zoning, *Flood protection, Legislation, Flood damage, Land use, Engineering projects, Project planning, Flood plains, Local governments, Zoning.

Despite its reputation as a desert state, Arizona has experienced severe, if infrequent flooding. In 1973, the Arizona legislature passed two bills designed to alleviate future flood damage. Flood control activities can be divided into two general areas: (1) corrective measures, or manmade engineering projects, designed to retain and control flood waters; and (2) preventive measures which regulate land use in areas susceptible to flooding. In passing the flood control assistance law, a corrective measure, the Arizona legislature for the first time made state funds available for a portion of the local share of a federally assisted flood control project. This law appropriates up to one-half of a community's share of project costs. On the other hand, the new preventive law attempts to regulate the development of the state's flood plains. Flood plain regulations are established to reduce the need for corrective projects. The strengths and weaknesses of both new flood control laws as applied in Arizona are analyzed. Possible modifications are recommended. (Schwerer-Florida)

FEDERAL JURISDICTION AND FEDERAL COMMON LAW - ENVIRONMENTAL LAW - PUBLIC NUISANCE SUITS CONCERNING IN-

TERSTATE WATER POLLUTION-ILLINOIS V. CITY OF MILWAUKEE, 406, U.S. 91 (1972),
R. A. Sherman.
Denver Law Journal, Vol 49, No 4, p 609-618, 1973.

Descriptors: *Judicial decisions, *Federal jurisdiction, *Water pollution control, *Illinois, Jurisdiction, Water pollution, State governments, Legal aspects, Sewage, Interstate, Waste disposal, *Wisconsin.

In the early 1970's the State of Illinois filed a motion for leave to file a bill of complaint under the original jurisdiction of the Supreme Court against four cities in Wisconsin and the Sewerage Commission of Milwaukee. Illinois requested that the Court abate the public nuisance being caused by the defendent's daily discharge of over 200,000,000 gallons of raw or inadequately treated sewage into Lake Michigan. The Court denied the motion and sent the case back to the appropriate federal district court for resolution of the controvery. The Court further reasoned that since the issue of a state-created public nuisance affecting another state is a federal question and that, in the absence of a specific substantive statutory remedy, the federal question should be resolved by applying the federal common law of nuisance. The significance of the decision lies in the Court's jurisdictional mandate and in its acknowledgement of the validity of federal common law in the adjudication of an interstate water pollution issue. (Wilson-Florida)

THE APPLICABILITY OF THE FEDERAL POLLUTION ACTS TO INDIAN RESERVATIONS: A CASE FOR TRIBAL SELF-GOVERNMENT,
L. E. Petros.
University of Colorado Law Review, Vol 48, No 1, p 63-93, Fall 1976.

Descriptors: *Indian reservations, *Clean Air Act, *Federal Water Pollution Control Act, Jurisdiction, Political aspects, Pollution abatement, Regulation, State jurisdiction, Federal jurisdiction, Water law.

The rapid development of Indian reservations raises the issue of how these lands are to be protected from pollution. Examined are the jurisdictional aspects of the Federal Water Pollution Control Act (FWPCA) and the Clean Air Act as applied to Indian reservation lands. Both acts are unclear as to whether Congress delegated power to the states to control pollution on reservation lands within their jurisdiction, or whether control was retained in the federal Environmental Protection Agency, the Interior Department of the Indian Tribes themselves. Of the two Acts, only the definitional section of the 1972 FWPCA even mentions Indians. Placing jurisdiction over Indian reservations in the states, absent an express congressional grant, violates basic principles of Indian law. Further analyzed is the question of whether self-regulation by the tribes exists within these two Acts. (Schwerer-Florida)

THE THIRD UNITED NATIONS CONFERENCE ON THE LAW OF THE SEA: THE 1975 GENEVA SESSION,
J. R. Stevenson, and B. H. Oxman.
American Journal of International Law, Vol 69, No 4, p 763-797, October 1975.

Descriptors: *United Nations, *International law, *Law of the Sea, International waters, Treaties, Regulation, Governments, Boundary disputes, Political aspects, Legal aspects.

The principle procedural result of the Third United Nations Conference on the Law of the Sea (Conference) was the preparation of informal single texts covering all substantive subjects before the Conference. These texts are intended as a basis for negotiations of a comprehensive treaty. The texts are examined to explain the accomplishments of and the problems facing this Conference. The content of each text is compared with previous proposals and provisions. The texts of the following substantive subjects are examined: (1) the Territorial Sea and Contiguous Zone; (2) Straits Used for International Navigation; (3) The Economic Zone; (4) the Definition of Continental Shelf; (5) the High Seas; (6) Access to the Sea by Landlocked States; and (7) Archipelages. The conference also sought to compile standards on protection the marine environment. The overall effort of the conference is evaluated, successful completion of the conference was not met. (Daniels-Florida)

REGIONAL ARRANGEMENTS IN THE OCEANS,
Rhode Island Univ., Kingston.
L. M. Alexander.
American Journal of International Law, Vol 71, No 1, p 84-109, January 1977.

Descriptors: *Regional analysis, *Law of the Sea, *International waters, *Geographical regions, Regions, Institutions, Oceans, International law, Management, Treaties, Governmental interrelations.

Ocean management has changed since the first Law of the Sea Conference. Multistate regional interests and arrangements are emerging. Three types of marina regions are identified: (1) physical regions, basically ocean basins and semi-enclosed seas; (2) management regions, functional in nature and respond to management problem-solving; and (3) operational regions, sites of one or more regional arrangements. It is better to approach regional action from the perspective of environmental problems requiring action, than from the perspective of participating states, as concerns of each state may differ. Five necessary components of marine regional arrangements are discussed in detail: (1) the area of activity; (2) the institutional level; (3) the use category; (4) the objectives; and (5) the integrative forces. The scope of existing institutions is also presented to emphasize variations in nature and functions. Future developments hinge to a degree on the formulation of a treaty by the Conference. Regional arrangements will probably interact closely with certain geographic areas of the ocean, and international power relationships will no doubt be affected. (Tabano-Florida)

POLITICAL COBWEBS BENEATH THE SEA, Committee on Interior and Insular Affairs (U. S. Senate).
D. P. Stang.
International Lawyer (A.B.A.), Vol 7, No 1, p 1-15, January, 1973.

Descriptors: *United Nations, *Law of the Sea, *Treaties, *Resources development, Conferences, Jurisdiction, Governments, International law, International waters, Water resources, *Beds under water, *United Nations Seabed Committee.

The accomplishments of the United Nations Seabed Committee are examined during a two year period ending the summer of 1972. The Seabed Commission was the preparatory body for a 1973 Law of the Sea Conference. Two documents were agreed upon at the summer 1972 session, the only tangible results of two years work. The first document is a list of 107 issues and sub-issues which the 1973 Law of the Sea Conference should discuss. The second document contains draft texts on seabed principles. It is contended the Seabed Committee did not reach agreement on the major issues. There is a summary of the major unresolved issues reflected in these documents. The inherently political nature of the Seabed Committee may be a reason for its inability to reach agreement on major issues. The potential benefits of a moratorium on states' activities in the seabed area beyond their national jurisdiction is examined. (Daniels-Florida)

MARINE RESOURCES COMMITTEE (ANNUAL REVIEW OF ACTIVITIES - 1975). American Bar Association, Washington, DC. Natural Resources Section.
Natural Resources Lawyer, Vol 9, No 2, p 238-252, 1976.

Descriptors: *Marine fisheries, *Resources development, *Water pollution control, Beds under water, Administrative agencies, Water law, Coast guard regulations, Federal government, Judicial decisions, Legislation, Administrative decisions, *Outer Continental Shelf Lands Act.

As to United States (U.S.) offshore seabed resources, bills are pending in Congress that would extensively amend the Outer Continental Shelf Lands Act. In March, 1975, the United States Supreme Court decided the U.S. has sovereign rights over the seabed and subsoil underlying the Atlantic Ocean three miles from the coast. Coast Guard regulations for licensing, designing, constructing and operating deepwater ports were published in November, 1975. In 1975, the first preliminary approval of a state coastal zone management program occurred, when Washington's program was approved. Public Law 94-70 was enacted in 1975 to give effect to the International Convention for the Conservation of Atlantic Tunas. A proposed Convention on Civil Liability for Oil Pollution Damage from Offshore Operations was in the late stages of negotiation at the close of the year. The first criminal action under Section 311 of the Federal Water Pollution Control Act was initiated in Philadelphia against the captain of a Liberian tanker. (Wilson-Florida)

POSSIBLE SOLUTIONS TO THE 200-MILE TERRITORIAL LIMIT,
R. O. Freeman.
International Lawyer (A.B.A.), Vol 7, No 2, p 387-395, April 1973.

Descriptors: *Law of the Sea, *Resource allocation, *Boundary disputes, *Resources development, Resources, International law, International waters, Competition, Beds under water, Oceans, Conferences, United Nations.

Bilateral or multilateral agreements concerning the allocation of ocean resources are suggested as substitutes for unilateral declarations which attempt to control the exploitation of those resources. Controversy exists over the unilateral control of ocean resources beyond a nation's territorial limits. There is an analysis of the 200-mile limit, that zone extending up to 200 miles from a nation's coast, which some nations claim sovereignty over. The interests of the coastal antions are examined. Rather than having coastal nations decide the extent to which they may assert control over the contiguous sea, four alternative methods for deciding the extent of this control are given. International conventions regarding the exploitation of resources on a worldwide basis is considered the preferrable approach. A Cuban-Mexican draft proposal for an international convention, submitted at the Rome Conference of 1955, is briefly examined. The benefits of a convention and problems facing a convention's success are discussed. (Daniels-Florida)

INCLUDING GEOTHERMAL RESOURCES WITHIN THE MINERAL ESTATE: THE NEED FOR A STATUTORY RULE OF PRESUMPTION,
S. M. Farnsworth.
Brigham Young University Law Review, Vol 1978, No 3, p 593-616, 1978.

Descriptors: *Geothermal studies, *Energy conversion, *Resources development, Water policy, Water law, Judicial decisions, Energy, Legislation, Mineral industry, Natural resources.

Deciding whether a recently-found valuable resource is included within a general conveyance of all the mineral rights in a piece of property is not new to the courts. Near the turn of the century courts were asked to decide whether oil and gas were 'minerals' within the terms of deeds and leases. The difficulty in these cases arises because the term 'mineral' is used in so many senses. One

resource that has recently become valuable is geothermal energy. This increased interest in geothermal resources has raised the issue whether they belong to the mineral owner or to the surface owner. In determining these issues, courts can take different approaches: (1) constructional approach - examining the language used in the specific conveyance; or (2) functional approach - attempting to discern the intent of the parties by resorting to their general expectations regarding the use of their respective estates. While these approaches are effective, a preferable alternative would be a legislative determination of whether geothermal resources are presumptively included within the surface or the mineral estate. (Wilson-Florida)

ISLANDS AND THE DELIMITATION OF THE CONTINENTAL SHELF: A FRAMEWORK FOR ANALYSIS,
D. E. Karl.
American Journal of International Law, Vol 71, No 4, p 642-673, October 1977.

Descriptors: *Law of the Sea, *Continental Shelf, *Islands, International law, Boundaries(Surfaces), International commissions, Conferences, Foreign countries, Legal aspects, Analysis, United Nations.

One of the recurring problems in the law of the sea is the treatment of islands in the delimitation of the continental shelf between opposite and adjacent states. This issue has been magnified by developments at the Third United Nations Conference on the Law of the Sea, and in particular, by the adoption of equitable principles as the standard for delimitation of the continental shelf and exclusive economic zone between adjacent and opposite states. On the assumption that the content of these equitable principles may be derived from contemporary state practice in maritime delimitations, state practice is used to construct an analytical model of the continental shelf problem of islands. This model relies primarily on an island's relative location and secondarily on its relative size with respect to the delimiting states. It provides a framework for determining how an island should be treated in a given delimitation. The principles derived from this analysis will have an important bearing on the new problem of the delimitation of the exclusive economic zone. (Wilson-Florida)

WATER DELIVERIES UNDER THE RIO GRANDE COMPACT,
S. E. Reynolds, and P. B. Mutz.
Natural Resources Journal, Vol 14, No 2, p 201-205, April 1974.

Descriptors: *New Mexico, *Colorado, *Water allocation(Policy), Water control, Water resources, Water supply development, Water rates, Consumptive use, Water storage, Projects, *Rio Grande Compact.

This is a record of the water deliveries to and releases from project storage by Colorado and New Mexico under the Rio Grande Compact (Compact). Both Colorado and New Mexico have been in a debit status during most of the time the Compact has been in effect. Debit status means withdrawing more water than one has delivered to the project reservoirs. The practical effect of debit status has been to restrict the use of reservoirs constructed after 1937 in Colorado above Lobatos and after 1929 in New Mexico above San Marcial. The reasons for the debit status of these states and for reversing of this status are explored. As a result of New Mexico's and Colorado's debit status, Congress authorized a cooperative effort to rectify the Rio Grande channel and other works. Colorado has also been sued to enforce the Compact. By 1972 New Mexico liquidated her debit and Colorado established a definite trend toward credit status. (Daniels-Florida)

WRESTLING WITH WATER QUANTIFICATION IN WESTERN STATES,
G. Othmer.
Natural Resources Journal, Vol 14, No 3, p 423-430, July 1974.

Descriptors: *Water measurement, *Reservation doctrine, *Federal-state water rights conflicts, Water distribution(Applied), Water allocation(Policy), Federal government, Water policy, Water resource development, Water permits, Water utilization.

Nineteen states have adopted various types of state administered water distribution systems, attempting to achieve maximum efficiency in water usage. The practicalities of administration are complicated. The state water administrative bodies are plagued by one very unpredictable water user -- the United States Government. This obstacle to effective quantification by state government is an outgrowth of two decisions that have since been modified. These decisions stated that, whenever Congress sets land aside for a particular purpose, an unspecified quantity of water is reserved. The Federal Government hesitates to document the types of uses and the quantities of water it will use on federal land under state programs. The difficulty of the federal position is illustrated by comparing individual state reactions to classifying recreational or conservational uses as beneficial uses. Whether or not federal uses would be considered beneficial would be subject to nineteen interpretations. This uncertainty forces federal agencies into state proceedings which might inhibit planning and destroy valuable water rights. Some system of uniform reporting should be established to aid western states in water-use planning. A sample uniform federal form is suggested. (Daniels-Florida)
W80-05091

THE RAINBOW BRIDGE CASE AND RECLAMATION PROJECTS IN RESERVED AREAS,
J. B. Draper.
Natural Resources Journal, Vol 14, No 3, p 431-445, July 1974.

Descriptors: *Federal Project policy, *Reclamation, *Project planning, Federal government, Legislation, Projects, Water resources development, Environmental effects, Legal aspects, National parks, National monuments.

The following theory is tested: that an invasion of a reserved area, such as a national monument, by a reclamation project will be permitted by Congress when two or more projects threatening to invade different reserved areas are proposed to Congress simultaneously. In the Rainbow Bridge case, the court did not enjoin a reclamation project which resulted in an invasion of a national monument. The Rainbow Bridge decision and its impact as a political precedent are analyzed in order to test this theory against several other reclamations controversies involving reserved areas held by the federal government. There are only two multiple-project controversies against which the theory can be tested. The first involved the 1956 Colorado River Storage Act which resulted in the flooding of Rainbow Bridge. The second was the 1968 Colorado River Basin Project Act which authorized a reservoir in the Gila Wilderness. The theory advanced is valid, but some modifications should be made. Only when normal alternatives open to Congress are limited, and two or more projects are proposed simultaneously will an invasion of reserved areas be permitted. (Daniels-Florida)

SALINITY ASPECTS OF THE COLORADO RIVER AGREEMENT,
Texas Tech Univ., Lubbock.
H. E. Dregne.
Natural Resources Journal, Vol 15, No 1, p 43-53, January 1975.

Descriptors: *Colorado River Basin, *Water quality control, *Salinity, *Mexico, Colorado River, Treaties, Agriculture, Governmental interrelations, Financial feasibility, River basins, Water users, Water delivery.

The 1973 Colorado River agreement between Mexico and the United States is intended to resolve the conflict over the salinity of the river at the international boundary. Prior to this agreement, the United States had been pumping water of a high saline quality into Mexico as part of its allotment under treaty. Mexican agricultural interests protested, and the United States agreed to pump water of a satisfactory quality to Mexico and to maintain that quality. Although the dispute has been settled, the salinity problem in the river remains. Dam reservoirs and irrigation are major causes of the salinity problem, and future water development programs could lead to further degradation. Salinity control measures are now being undertaken to keep the content at acceptable levels. Problems with the agreement exist, including cost and the fact that the basin states were not made a part of the decision-making process. Modern technology can keep the salinity at acceptable levels, but success will not be easily achieved. (Tabano-Florida)

PORT AUTHORITIES VIEW STATE COASTAL MANAGEMENT PROGRAMS,
Maine Dept. of Transportation, Portland. Bureau of Waterways.
E. Langlois.
Coastal Zone Management Journal, Vol 2, No 2, p 171-176, 1975. 2 Fig.

Descriptors: *Port authorities, *Shore protection, *Economic impact, Planning, Development, Programs, Environmental engineering, Surveys, Harbors, Management, Coasts.

The American Association of Port Authorities conducted a survey among its member ports, to determine the extent of their interest and participation in the planning and implementation of their state coastal zone management programs. According to most port directors surveyed, a coastal zone management plan should provide the vehicle to balance economic development and environmental concerns. Introducing new and expensive facilities into existing ports requires extensive waterfront property acreage. Permits must be obtained for dredging in waterways and disposing of spoils. Environmental impact statements must be prepared. This concern for the environment is growing along with the development of new legislation, policy, guidelines, and regulations at all levels of government. The federal Coastal Zone Management Act (Act) has added a new dimension to the thinking of the port authority director. Port directors wonder how the need for ports and commerce fits into coastal planning programs. Twenty-three ports have assigned personnel to work with state planners in implementing the Act. Thirty ports have growth plans ready for implementation or on the drawing boards. (Wilson-Florida)

SOME LEGAL ISSUES IN THE COASTAL ZONE MANAGEMENT ACT: GRANT-IN-AID ASPECTS - PART ONE,
Wisconsin Univ. Madison.
Z. L. Zile.
Coastal Zone Management Journal, Vol 3, No 1, p 30-70, 1976.

Descriptors: *Grants, *Coasts, *Shore protection, *Federal-state water rights conflicts, Federal government, Legislation, Administrative agencies, Legal aspects, Regulations, Administration, Management, State governments.

There are potentially troublesome legal issues deriving from the nature of the Coastal Zone Management Act (Act) as a grant-in-aid measure. The tension between federal and state perceptions of the coastal realities are explored. This tension may result in nonutilization of underutilization of the Act. Several agency strategies are hypothesized and evaluated as a means for bridging the gap. Questions associated with grant awards, program approval and termination of assistance are surveyed. Occasional conflicts between the granting agency and the recipient may reach litigation stage, especially due to the intervention of politically active third parties. The legal nature of grants procedural guarantees, judicial review and stand-

ing requirements of third parties are analyzed. Principles of general administrative law are applied to specific situations envisioned by the Act and its implementing regulations. Conclusions and recommendations are made in the second part of this article. (Daniels-Florida)

SOME LEGAL ISSUES IN THE COASTAL ZONE MANAGEMENT ACT: GRANT-IN-AID ASPECTS - PART TWO,
Wisconsin Univ.-Madison.
Z. L. Zile.
Coastal Zone Management Journal, Vol 3, No 2, p 151-169, 1977.

Descriptors: *Coasts, *Land use, *Shore protection, Administrative agencies, State governments, Federal government, Administration, Grants, Participating funds, Legal aspects, Management, Legislation.

Legal issues regarding compliance with grant conditions and participation in the development of coastal management programs are considered. Assistance under the Coastal Zone Management Act (Act) is in the form of conditional grants. The granting agency is obligated, in principle, to secure compliance with the grant conditions. Most administrative review of grantee performance occurs in the day-to-day work process. The presence of Congressional review is an incentive. The Act, the implementing regulations and the grant instruments provide mechanisms to cope with most contingencies. Lax enforcement of grant conditions can invite third-party intervention, robbing the granting agency of some of its initiative and control over the dispute settlement process. Participation in coastal management programs is developed in numerous legal guarantees, invitations and procedures. Some uncertainty remains as to whether the words can be translated into action approximating what was intended. The loose standards for participation might be used by parties pursuing diverse objectives to impede coastal zone management. (Daniels-Florida)

STATE REVIEW OF LOCAL LAND-USE DECISIONS: THE CALIFORNIA COASTAL COMMISSIONS,
California Univ., Davis.
P. Sabatier.
Coastal Zone Management Journal, Vol 3, No 3, p 255-290, 1977. 8 Tab.

Descriptors: *California, *Land use, *Shore protection, Permits, Legal aspects, Decision making, Reviews, Coasts, Land development, Local governments, Legislation.

The California Coastal Zone Conservation Commissions have been required to review virtually all development projects approved by local government within approximately 1000 yards of the coast. Ninety-seven percent of all permits were approved in some fashion by the regional commissions. Examined are the 4% of regional commission decisions that were significant or controversial enough to be appealed to the State Commission in the first 2 1/2 years of the permit review program. The regional commissions imposed conditions on or denied more than 50% of the projects subsequently appealed to the State Commission. The State Commission held even more restrictive views of permissable development. There are a number of reasons for the more restrictive state view, including differences in policy, the presence of state-appointed commissioners, and the willingness of environmental groups to become actively involved in the appellate process. All are necessary conditions for obtaining comparably stringent policy outputs. (Daniels-Florida)

FLORIDA AND COASTAL ZONE MANAGEMENT,
J. R. Brindell.
The Florida Bar Journal, Vol 54, No 4, p 295-299, April 1980.

Descriptors: *Florida, *Coasts, *Shore protection, Federal government, State government, Legislation, Management, Resources development, Resources, Programs.

Florida has an interrelationship between land and coastal waters more extensive than that of any other state. The magnetism of these natural features has created Florida's most fundamental dilemma -- how to maintain the benefits of our coastal resource and maximize individual freedom of choice, without destroying the benefits. On a national level, the 1972 Coastal Zone Management Act (CZMA) was enacted to deal with this dilemma. CZMA calls for non-compulsory state participation in the federal management program. The Florida legislature passed the 1978 Florida Coastal Management Act (FCMA) directing a state program, based upon existing state laws and regulations, be submitted to the federal government for approval. The focus of the state program is a refinement of current management and regulatory schemes so that Florida's coastal resources will be effectively managed. The current effort provides a timely and useful framework within which Florida can significantly improve resource management. (Daniels-Florida)

Stow, Massachusetts, which depends on private wells for its water supply, hired an environmental planning firm to map major aquifers and recharge areas and make recommendations to protect and preserve its ground water. This resulted in the formation of an aquifer protection district, adoption of new zoning laws, changes in current zoning practices relating to septic systems and housing density, and identification of proper areas for industrial and commercial development, road salting and possible future municipal well fields. A PRELIMINARY FEASIBILITY STUDY TO IRRIGATE WESTERN UMATILLA AND NORTHEASTERN MORROW COUNTIES, OREGON.
Oregon Dept. of Water Resources, Salem.
September 1975, 30 p, 12 Maps.

Descriptors: *Irrigation, *Columbia River, *Feasibility studies, Oregon, Irrigation districts, Reservoirs, History, Dams, Canals, Wells, *Umatilla Co.(OR), *Morrow Co.(OR).

Twelve alternative plans are presented for irrigation of west Umatilla and northeast Morrow Counties (OR), using water pumped from the Columbia River. Each plan is divided geographically, with initial and annual costs for each segment given separately. At present, about 20,000 acres in the area are irrigated from wells; withdrawal of ground water is greater than recharge. The Stanfield and Westland Irrigation districts currently obtain their water supply from spring runoff in the Umatilla River with storage at McKay Reservoir. A rate of nine gal/min/acre was used in the study as a peak irrigation requirement, except for plans 10 and 12. The 12 alternatives are: (1) irrigation water provided to the entire 79,700-acre area from a point on the river below Umatilla, using pipelines and canals to irrigate higher elevations; (2) same as no. (1) except only pipelines used for higher elevations; (3) 65,340 acres west of Umatilla River from below Umatilla; (4) 75,262 acres; Butter Creek area excluded; (5) 50,905 acres; higher areas excluded; (6) 15,000 acres currently irrigated plus 31,468 acres in Stanfield-Westland; (7) 6,510 acres currently irrigated plus 7,850 acres in Stanfield from a point below Hat Rock State Park; (8) same as no.

(7) excluding 6,510 acres; (9) 60,592 acres west of Umatilla River from below Umatilla; (10) same as no. (9) except seven gal/min/acre; (11) 79,700 acres from below Hat Rock Park; (12) same as no. (11) except five gal/min/acre. (Lynch-Wisconsin)

7. RESOURCES DATA

7A. Network Design

DISCHARGE DATA AT WATER-QUALITY MONITORING STATIONS IN ARKANSAS, 1978 WATER YEAR,
Geological Survey, Little Rock, AR. Water Resources Div.
R. K. Knott.
Available from: OFSS Box 25425, Fed. Ctr. Denver, CO 80225, Paper copy $2.25, Microfiche $3.50. Geological Survey open-file report 79-1349, 1979. 17 p, 2 Tab.

Descriptors: *Discharge measurement, *Network design, *Water quality, *Monitoring, *Stations, Arkansas, Streams, Data collections, Streamflow, Flow rates, Stage-discharge relations, Gaging stations, *U.S. Geological Survey, *U.S. Army Corps of Engineers.

Discharge data were computed for a network of water-quality monitoring stations operated throughout Arkansas by the Arkansas Department of Pollution Control and Ecology. Each site is numbered and described. Some of the sites are located at U.S. Geological Survey or U.S. Army Corps of Engineers daily-discharge stations, but most are at points where discharges are not regularly measured. Data were obtained as follows: (1) For sites located at gaging stations, discharges were obtained from Geological Survey and Corps of Engineers annual publications; (2) for sites not too distant from gaging stations, discharges were estimated by using gaging-station records; and (3) for other sites, a series of discharge measurements were made at each site to define a stage-discharge curve from which discharge was computed. Discharges on days of sampling were determined for about 90 of the sites. A tabular summary for the water year 1978 is given. Several discharges for miscellaneous dates in the 1977 water year are shown. (Kosco-USGS)

ORGANIC SOLUTE-MINERAL SURFACE INTERACTIONS: A NEW METHOD FOR THE DETERMINATION OF GROUNDWATER VELOCITIES,
Indiana Univ. at Bloomington.
P. Ciccioli, W. T. Cooper,, P.M. Hammer, and J. M. Hayes.
Water Resources Research, Vol 16, No 1, p 217-223, February 1980. 5 Fig, 1 Tab, 16 Ref. ORNL (Sub. 7031) W-7405-ENG-26.

Descriptors: *Groundwater movement, *Tracers, *Organic compounds, *Velocity, Solutes, Surfaces, Polarity, Adsorption, Groundwater, Measurement, Mass transfer, Equipment, Halocarbons, Multiple tracer procedure.

When the adsorption processes affecting the migration rates of organic solutes in groundwater systems are considered in detail, it can be shown that the use of multiple tracers should allow accurate calculation of the groundwater velocity even when all the tracers are retarded to some extent by interactions with mineral surfaces in the aquifer and even when the extent of that retardation is not known beforehand. It should be required only that the tracers be members of a series of compounds whose surface interaction energies vary regularly, this condition being met, for example, by compounds in the series C2ClnF(6-n). Experimental studies aimed at testing this concept show that two series of tracers behave as expected on laboratory columns (limestone and sand), thus indicating the fundamental validity of the approach. Further, the nature of the interactions between the mineral surfaces and the tracer molecules can be shown in these cases, at least, to be nonspecific, the strength of the interaction depending only on the polarizability of the tracer molecule. It seems likely that other satisfactory tracers can be selected using this criterion and that the approach should be applicable even to systems involving many different mineral surface types. (Visocky-ISWS)

DEVELOPMENT OF A SELF-SEALING SAMPLER FOR EPHEMERAL WADI FLOODS,
Ben Gurion Univ. of the Negev, Beersheba (Israel). Inst. of Desert Research.
M. Levin, E. Adar, and A. Barzilai.
Water Resources Research, Vol 16, No 1, p 245-249, February 1980. 5 Fig, 1 Ref.

Descriptors: *Sampling, *Floods, *Deserts, *Intermittent streams, Equipment, Instrumentation, Design, Precipitation(Atmospheric), Rainfall, Flash floods, Hydrology, Flood samplers.

The sampling of random floods for the analysis of environmental isotopes in flood water is handicapped by the fact that this water may partially evaporate between the time of the flood and the actual collection of the sample. Conventional methods of sampling are frequently ineffective, as floods occur at random both in time and space. With these considerations in mind, an instrument that enables automatic sampling of flood water was designed and built. The sample is hermetically sealed, and secondary effects that could change the original sample in any way are thus avoided. (Sims-ISWS)

PYRANINE USED AS A FLUORESCENT TRACER IN HYDROLOGY: PH EFFECTS IN DETERMINATION OF ITS CONCENTRATION,
CEA Centre d'Etudes Nucleaires de Grenoble (France).
M. Launay, M. Tripier, J. Guizerix, M. L. Viriot, and J. C. Andre.
Journal of Hydrology, Vol 46, No 3/4, p 377-383, April 1980. 2 Fig, 2 Tab, 9 Ref.

Descriptors: *Tracers, *Fluorescent dye, *Laboratory tests, *Analytical techniques, Dyes, *Hydrogen ion concentration, Streamflow, River flow, On-site investigations, Dye releases, Hydrology, Fluorescence, *Pyranine, Excitation, Buffering.

Pyranine is used as a fluorescent tracer in hydrology; but this compound which may exist under several ionic forms has, for a given concentration, a fluorescence emission which depends strongly on the pH. A simple method was proposed for the measurement of fluorescence intensity of the tracer by buffering solutions at fixed pH values: pH 10 (excitation at 450 nm, emission at 515 nm) or pH 5 (excitation at 403 nm, emission at 515 nm). In both cases, the limit of detection is close to 4 x 10 to the minus 10th power g/g. (Sims-ISWS)

DETERMINATION OF TRACE ELEMENTS IN NATURAL WATERS BY THE D.C. ARGON PLASMA, MULTIELEMENT ATOMIC EMISSION SPECTROMETER (DCP-MAES) TECHNIQUE,
Colorado State Univ. Fort Collins. Dept. of Chemistry.
G. W. Johnson, H. E. Taylor, and R. K. Skogerboe.
Spectrochimica Acta, Vol 34B, p 197-212, 1979. 7 Fig, 10 Tab, 14 Ref.

Descriptors: *Trace elements, *Natural streams, *Surface waters, *Groundwater, *Evaluation, Analytical techniques, Spectrometers, Instrumentation, Chemical analysis, *Atomic emission spectrometry.

The capabilities and limitations of a commercial direct current argon plasma, multielement atomic emission spectrometric (DCP-MAES) technique for the determination of 18 common elements in water have been evaluated. The results demonstrate that the unit offers acceptable capabilities with respect to selectivity, sensitivity, accuracy, speed and economy for the determination of many of the elements investigated. Interferences in the determinations of those elements subject to stray light due to the presence of calcium and (or) magnesium can often be compensated for by use of a simple linear correction procedure. A comparison of two-electrode and three-electrode d.c. argon plasma systems has shown that the latter offers advantages such as improved stability and lower background. A comparison with results published for a system based on excitation in an inductively coupled plasma has indicated that the present system offers comparable analytical capabilities for several of the elements investigated. THE USE OF THE CLIMATIC WATER BUDGET TO EVALUATE THE VALIDITY OF A PRECIPITATION RECORD,
Delaware Univ., Newark. Dept. of Geography.
J. R. Mather, and C. M. Rowe, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182157, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Center, University of Delaware, Technical Research Report, 1979. 25 p, 10 Fig, 4 Tab, 12 Ref, 3 Append. OWRT A-040-DEL(5), 14-34-0001-9008.

Descriptors: *Water balance, *Hydrologic budget, *Precipitation(Atmospheric), *Climatology, *Runoff, Industrial water, Inflow, Flow rates, Correlation analysis, Water management, Indiana, La Porte area(Ind).

From 1927 to 1963 the precipitation recorded at La Porte, Indiana about 30 miles southeast of the

Chicago-Gary industrial complex was significantly higher than the precipitation found at any nearby station. Two reasons have been suggested for this anomaly. The first assumes that the record is correct and suggests that industrial pollution has resulted in increased downwind precipitation amounts. The second assumes that the record is incorrect and is merely the result of instrumental or observer error. This report describes the use of the climatic water budget to determine the more likely conclusion. Values of runoff were computed from climatic data from La Porte as well as from South Bend, and Plymouth, Indiana, the stations nearest to La Porte. The computed runoff values from South Bend and Plymouth were most closely correlated with the anomalously high precipitation could have occurred in a cylinder only 1.37 miles in radius centered over La Porte, without significantly changing basin runoff. Such a small area of anomalously high precipitation would seem unlikely to occur as a result of industrial pollution. The water budget, thus, suggests that observer error is a more realistic suggestion than industrial pollution for the La Porte anomaly.

MICHIGAN JOB USES GEOPHYSICAL AIDS,
UOP, Inc., St. Paul, MN. Johnson Div.
W. L. Anderson.
Johnson Driller's Journal, Vol 51, No 6, p 2-4, 9, November-December, 1979. 3 Fig.

Descriptors: *Gravity studies, *Subsurface investigations, *Glacial aquifers, Michigan, Gravimeters, Digital computers, Bedrock, Valleys, Lake sediments, Ground water, Municipal water, Water supply, Remote sensing, Geophysics.

A gravity survey of a glacial drift area in and around Munising, Michigan used a La Coste and Romberg Model G gravimeter and a CDC digital computer to adjust data for effects of latitude, elevation, etc. Results of the survey indicated that an extensive buried valley existed beneath the city with an estimated overburden thickness of 200 feet. The presence of highly permeable lake sands throughout the area suggested that the valley fill might consist principally of permeable glacial deposits. Subsequent drilling and aquifer testing confirmed this hypothesis. (Purdin-NWWA)

INTERVENTION ANALYSIS WITH MISSING DATA,
Washington Univ., Seattle. Dept. of Civil Engineering.
D. P. Lettenmaier.
Water Resources Research, Vol 16, No 1, p 159-171, February 1980. 5 Fig, 6 Tab, 12 Ref, 1 Append. NRC AT(49-24)-022.

Descriptors: *Estimating equations, *Time series analysis, *Model studies, *Mathematical models, Data processing, Data collections, Meteorological data, Hydrologic data, Water quality, Water pollution, Environment, Statistics, Monte Carlo method, Analytical techniques, Missing data, Missing data estimation, Intervention analysis.

Intervention analysis is a potentially useful tool for modeling time series when the process mean undergoes changes as the result of an external perturbation. The utility of the technique for water resource applications is, however, limited by the requirement that the data be collected uniformly in time. Two approaches for estimating missing data, one of which provides minimum variance estimates when model parameters are known, and a computationally simpler approximation were investigated. The approximation was found to be quite adequate and was incorporated in a practical scheme to estimate missing data and model parameters simultaneously. Subsequently, a method for estimating the parameter variance for use in significance tests on the intervention magnitude was investigated. The adequacy of the approximation was assessed in a series of Monte Carlo tests using three models consisting of step, linear, and impulse decay trends in mean with residual lag 1 Markov noise. Results of the experiments indicated that the suggested method provides adequate estimates of the variance of the intervention magnitude of the step and impulse decay models but that the variance was substantially overestimated for the linear model. However, for the same proportion of missing data the accuracy of the approximation improved as the sample size increased. (Sims-ISWS)

TECHNIQUES FOR EXPLORING AND PRESENTING DATA APPLIED TO LAKE PHOSPHORUS CONCENTRATION,
Michigan State Univ., East Lansing. Dept. of Resource Development.
K. H. Reckhow.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 37, No 2, p 290-294, February 1980. 2 Fig, 3 Ref. NOAA 03-78-B01-109.

Descriptors: *Water quality, *Phosphorus, *Lakes, *Data processing, Statistics, Model studies, Analytical techniques, Data collections, Limnology, *Data presenting.

Water quality sampling and data analysis are undertaken to acquire and convey information. Therefore, when data are presented, the form of this presentation should be such that information transfer is high. For example, a graph or table of average values is often an inadequate summary of batches of data. As an alternative, a technique was presented (that was developed for exploratory data analysis purposes) that can be used to display several sets of data on a single graph, indicating median, spread, skew, size of data set, and statistical significance of the median. This technique is useful in the study of phosphorus concentration variability in lakes. Additions to, and modifications of, this procedure are easily made and will often enhance the analysis of a particular problem. Some suggestions were made for useful modifications of the plots in the study and display of phosphorus lake data and models. (Sims-ISWS)

WISCONSIN, A SUMMARY OF ACTIVITIES AND PLANS OF THE UNITED STATES DEPARTMENT OF THE INTERIOR, GEOLOGICAL SURVEY, 1979.

Geological Survey, Madison, WI. Water Resources Div.
Geological Survey Wisconsin District report, 1979. 81 p.

Descriptors: *Wisconsin, *Projects, *Water resources, *Geological Survey, *Land resources, Mineralogy, Water resources development, Hydrologic data, Floods, Sediment transport, Streamflow, Low flow, Groundwater resources, Aquifer characteristics, Water quality, Mapping, Publications, Bibliographies, Reviews.

The U.S. Department of the Interior's Geological Survey, established in 1879, is the Nation's principal fact-finding agency concerned with physical resources--the configuration and character of land surface, the composition and structure of the underlying rocks, and the quality, extent, and distribution of water and minerals. The Survey is an impartial fact-finding and research agency that gathers and interprets data so that managers can make decisions based on objective information. The Wisconsin program of the U.S. Geological Survey is, for the most part, planned and funded with local and State agencies through cooperative programs. This booklet will be useful to cooperating agencies by providing an understanding of all current studies and identifying present and future resource problems that are relevant to the experience and competence of the Survey in Wisconsin. From 1915, or earlier, to 1966, with the exception of 1963, Knik Glacier annually formed and released Lake George, the largest glacier-dammed lake in Alaska. Eleven geodetically controlled survey stations were defined in the basin, and 22 glacier surface altitudes were measured. This is the first effort in a continuing program whose goal is predicting the future behavior of Knik Glacier and Lake George. (Kosco-USGS)

GROUND WATER FLOW COMPUTATIONS BY METHOD OF LINES,
Florida Univ., Gainesville. Hydrology Lab.
A. D. Koussis, and R. W. Watson.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 106, No 1R1, p 1-8, March, 1980. 3 Fig, 10 Ref.

Descriptors: *Ground water movement, *Numerical analysis, *Method of Lines, Equations, Aquifers, Water table, Approximation method, Seepage.

Numerical integration by Methods of Lines is applied to general conditions of two-dimensional unconfined ground water flow. According to this method, the original partial differential equation (PDE) is converted to a set of coupled ordinary differential equations (ODE) by discretizing in one of the independent variables while keeping the other continuous. The set of ODE thus obtained can be solved by techniques more efficient and powerful than those available for solving PDE. The method was found to be versatile, efficient, and easy to program using a variety of established methods for the solution of ODE. Higher order approximations to the derivations can be easily introduced, thus improving the convergence towards the true solution and enabling the solution to be carried out on a programmable hand-held calculator. The Method of Lines is also capable of handling water table profiles of various shapes as initial conditions, and other problems such as seepage flow over an inclined impervious layer. (Purdin-NWWA)

FLOW NETS BY THE FINITE ELEMENT METHOD,
Stone and Webster Engineering Corp., Boston, MA.
J. T. Christian.
Ground Water, Vol 18, No 2, p 178-181, March-April, 1980. 4 Fig, 9 Ref.

Descriptors: *Flow nets, *Finite-element analysis, *Computer models, Potential flow, Sheet piling, Wells, Earth dams, Anisotropy.

This paper describes how conventional finite element analyses of steady-state flow in porous media are extended to develop values of the stream function and how the resulting potential and stream function are contoured to give both plane and radial flow nets. This procedure does not apply to multiple connected regions or to regions with internal sinks or sources. Four examples are provided to illustrate the use of the method and the results obtained. They are: (1) flow beneath a sheet pile wall; (2) radial flow toward a well which is fully cased and open only at the bottom; (3) flow through an earth dam composed of two materials; (4) and flow in an anisotropic medium. In all four cases, there is close agreement between hand solutions and computer solutions. (Purdin-NWWA)

DIFFERENCES SEEN IN OIL AND WATER WELL DRILLING,
UOP, Inc., St. Paul, MN. Johnson Div.
R. E. Allred.
Johnson Driller's Journal, Vol 51, No 6, p 7-8, November-December, 1979. 1 Fig.

Descriptors: *Water wells, *Oil wells, *Technology, Design, Construction, Well screens, Depth, Drilling, Gravel packing, Corrosion, Production.

Similarities and differences between oil and water well drilling are examined. Both use direct rotary drilling methods, but while water well rigs can drill to 2000 feet, the much larger oil well rigs can drill more than 10 times as deep. The technique of directional drilling is commonly used for oil wells but is not usually necessary for water wells. Oil wells that produce from more than one zone require sealed packers and separate production tubing whereas multiple-aquifer water wells are simply screened through each production interval. Methods of casing, cementing, and gravel packing in the wells can also differ. In very deep holes, oil production zones might be left uncased. During gravel packing of oil wells, cross-over tools are used in placing the gravel around the production screen. The size of this gravel is 10 to 12 times the formation size while water well design criteria call for gravel 5 to 6 times formation size. The corrosive environment and high temperatures of deep oil wells requires corrosion-resistant casing and screen. Two types of screen are manufactured for oil wells: a rod-base (pipeless) screen for maximum hydraulic efficiency and a pipe-base screen for maximum strength. (Purdin-NWWA)

AN ECCENTRIC REDUCER WAS THE ANSWER,
UOP, Inc., Thorofare, NJ. Johnson Div.
J. S. Miller.
Johnson Driller's Journal, Vol 51, No 6, p 8-9, November-December, 1979. 1 Fig.

Descriptors: *Water wells, *Repairing, *Joints(Connections), Well screens, Cooling water, Borehole cameras.

Extensive sand pumping in a well supplying cooling water was thought to be due to a break in the casing or screen. A downhole camera survey revealed that the screen and riser had been run without centering guides, and the riser had been sealed to the casing off center with a lead shot. A new liner screen was installed by using an eccentric reducer which centered the screen on the riser. (Purdin-NWWA)

EFFLUENT DISPOSAL METHODS,
Delta Well Co., Inc., Ronkonkoma, NY.
R. Schockley.
Ground Water Heat Pump Journal, Vol 1, No 1, p 27-28, Spring, 1980. 2 Fig.

Descriptors: *Injection wells, *Waste water disposal, Effluents, Cooling water, Design, Well spacing, Piping systems(Mechanical), Maintenance, Rehabilitation, Heat pumps, Ground water, Heating, Cooling.

The most common method of disposal of heat pump effluent is through injection wells. Injection wells should be designed for twice the capacity of the supply well, and a slight backpressure. Periodic maintenance and redevelopment should be performed. The injection well should be located downgradient from the supply well and at a far enough distance to avoid thermal interaction between the two wells. The proper design of the piping system includes installation of a filter and a pressure gauge in the injection line, and a connection to the injection well that provides full access to the well for development. Reversing the flow in summer and winter results in automatic redevelopment of the injection well. (Purdin-NWWA)

PRECISION DRILLING FOR DAM SAFETY.
Ground Water Age, Vol 14, No 8, p 37-38, April, 1980.

Descriptors: *Rotary drilling, *Foundations, *Bench marks, Surveying instruments, Dams, Safety.

The Test Drilling Service Company was contracted by the U.S. Army Corps of Engineers to drill precise foundation holes for dam survey monuments in the alluvial region around the Mississippi River and its tributaries. The drilling crew switched from air rotary to mud rotary drilling when they encountered layers of unconsolidated till and a loose gravel aquifer just above bedrock. The mud pump was modified to operate with compressed air. Hole deviation was kept within one percent of vertical, using a roller stabilizer right behind the bit. With a fixed monument, the

Corps believes that trilateration surveys will provide unprecedented precision in determining very small movements in dam and lock structures, and thus, an important advance in dam safety survey methodology. (Purdin-NWWA)

IMPROVING YIELDS OF OPEN WELLS IN CONSOLIDATED ROCKS USING EXTENSION DRILLING TECHNIQUES,
Geraghty and Miller, Inc., Annapolis, MD.
V. W. Uhl, Jr.
Ground Water, Vol 18, No 2, p 175-177, March-April, 1980. 2 Fig, 1 Tab.

Descriptors: *Drilling, *Dug wells, *Irrigation wells, Water wells, Water yield improvement, India, Water table aquifers, Bedrock, Technology, Economics, Feasibility.

Recent demands for increased food production in India have required improving yields of irrigation wells using extension drilling. This technique consists of drilling 1.5 to 2-inch diameter holes to depths of 50 feet starting at or near the bottom of hand-dug open wells in consolidated rock. This is accomplished using a drilling system composed of a jack hammer, drill rods, and tungsten carbide bits powered by compressed air. Air or water is passed through the hollow drill rods to flush cuttings from the hole. Before drilling, the open well is dewatered using a sump pump. If a vertical hole is to be drilled, a few feet of 2.5-inch diameter casing are installed and drilling is then carried out using a 1.5 to 2-inch diameter bit. The optimum location for drilling in open wells in shallow water table aquifers is at topographic low areas or ground water discharge areas where hydraulic potentials increase with depth, and where fracturing is usually more intensive. Extension drilling is both technologically and economically feasible for farmers owning medium to small size (1 to 10 acres) farms. (Purdin-NWWA)

BACTERIA: WHAT'S IN THE WATER.,
National Water Well Association, Worthington, OH.
S. Smith.
Water Well Journal, Vol 34, No 4, p 88-89, April, 1980.

Descriptors: *Bacteria, *Water pollution treatment, *Ground water, Iron bacteria, Sulfur bacteria, Coliforms, Chlorination, Water pollution sources, Disinfection, Water analysis, Testing procedures, Pathogenic bacteria, *Well spacing, *Well casings.

Proper location and construction of wells will help prevent ground water pollution. Lack of horizontal distance from a potential source of contamination can be compensated for by drilling to a suitable depth. Anything inserted into a well has the potential to contaminate ground water by iron and sulfur bacteria. Disinfection of well equipment with chlorine can reduce this potential. Iron and sulfur bacteria cause a disagreeable taste and odor. Coliform bacteria can be detected only with a multiple-tube fermentation (MPN) or membranous filter test. These tests should be performed by trained technicians using proper techniques and sterile test equipment in a state-licensed lab. Iron and sulfur bacteria are readily removed by proper chlorination. Fecal contamination is more difficult to remove. First the source of contamination must be located and eliminated. The aquifer may be decontaminated with short-term superchlorination followed by development. However, if the aquifer is extensively polluted, the water supply should be treated or a new aquifer located. (Purdin-NWWA)

WELL MAINTENANCE PROGRAMS CAN PREVENT FAILURES,
UOP, Inc., St. Paul, MN. Johnson Div.
R. L. Moore.
The Johnson Drillers Journal, Vol 52, No 1, p 4-7, January-February, 1980.

Descriptors: *Water wells, *Failure(Mechanics), *Maintenance, Sand pumping, Corrosion, Scaling, Pumps, Chemical degradation, Electrolysis, Well casings, Well screens, Collapse, Clogging, Inspection, Monitoring.

The deterioration of a well is usually gradual and predictable. A well may fail through sand pumping, corrosion, incrustation or by a breakdown in the pumping equipment. Sand pumping can occur in semi-consolidated or unconsolidated formations and is usually the result of poor screen design in new wells or corrosion in older wells. Corrosion can be due to chemical action or electrochemical action. Besides sand pumping, corrosion causes loss of strength and resulting collapse, and redeposition of corrosion products resulting in reduced yield. Chemical corrosion is found in low pH, low TDS environments, while in high pH, high TDS environments electrochemical corrosion occurs along with incrustation. Incrustation also occurs due to sharp pressure reductions near the screen causing precipitation of calcium carbonate or iron compounds. Deterioration of the well or pump can be detected early by periodic inspection and monitoring. Once the problem is identified, a regular program of preventive maintenance will insure a constant, reliable source of water for many years. (Purdin-NWWA)

8B. Hydraulics

FORCE FLUCTUATIONS ON SILL OF HYDRAULIC JUMP,
University of Manchester Inst. of Science and Technology (England). Dept. of Civil and Structural Engineering.
R. Narayanan, and L. S. Schizas.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY4, Proceedings Paper 15368, p 589-599, April 1980. 20 Fig, 9 Ref, 2 Append.

Descriptors: *Hydraulics, *Loads(Forces), *Energy dissipation, *Hydraulic jump, Flow, Fluctuations, Baffles, Energy, Turbulence, Drag, Model studies, Hydraulic models, Measurements, Instrumentation, Analysis, Data collections, Laboratory tests, Dimensional analysis, Hydraulic structures, Sills.

Fluctuations of force exerted on the sill of a forced hydraulic jump were measured and presented in terms of their root-mean-square values. Experiments involved a wide range of flow conditions, various distances of the sill from the efflux, and four different heights of the sill. Maximum intensity of force fluctuations occurs when the toe of the jump begins to be sensitive to the depth downstream of the sill. Under those conditions, the spectra of fluctuations exhibit a dominant frequency. At high submergence the intensity depends essentially on the height of the sill. (Humphreys-ISWS)

EXPERIMENTAL DETERMINATION OF THE VELOCITY GRADIENT IN TWO DIMENSIONAL TURBULENT FLOW,
Vanderbilt Univ., Nashville, TN.
S. D. Harris, J. W. Williamson, and R. H. French.
Journal of Hydraulic Research, Vol 18, No 1, p 25-33, 1980. 4 Fig, 3 Ref.

Descriptors: *Turbulent flow, *Flow characteristics, *Instrumentation, Velocity, Laboratory tests, Design, Turbulence, Measurement, Analytical techniques, Current meters, Hydraulics, Calibrations, *Velocity gradients, Velocity profiles.

Most experimental values of the velocity gradient, du/dy, in turbulent flow have been determined indirectly by first obtaining an experimental velocity profile and then graphically differentiating this profile. Thus, du/dy reflects errors made in measuring the velocity profile and errors made in obtaining the derivative of this profile by graphical techniques. Hence, the accuracy of du/dy and the subsequent mixing lenght and transfer coefficient calculations could be improved if an experimental method of obtaining du/dy directly in fully-developed, two-dimensional, turbulent boundary layer flow were available. The design of the gradient transducer involved the careful consideration of how airfoils generate lift. After testing several possible shapes, a satisfactory airfoil was devised. This airfoil was 3.81 cm.(1.5 in.) long and had a chord length of 1.905 cm.(0.75 in.). Its leading edge was rounded and its maximum thickness was 0.13 cm.(0.05 in.). The thickness decreased uniformly to a sharp, trailing edge. The lift force exerted on this airfoil was in the expected direction. The device was calibrated in a rectangular duct, and the results clearly demonstrate the validity of the design and the feasibility of measuring du/dy directly and accurately. (Humphreys-ISWS)

OSCILLATOR-MODEL APPROACH TO THE IDENTIFICATION AND ASSESSMENT OF FLOW-INDUCED VIBRATIONS IN A SYSTEM,
Karlsruhe Univ. (Germany, F.R.). Inst. fuer Hydromechanik.
E. Naudascher, and D. Rockwell.
Journal of Hydraulic Research, Vol 18, No 1, p 59-82, 1980. 12 Fig, 12 Ref.

Descriptors: *Hydrodynamics, *Flow around objects, *Vibrations, *Flow control, *Reviews, Flow system, Hydraulic structures, Flow characteristics, Mathematical models, Analytical techniques, Analysis, Dynamics, Drag, Frequency stabilizers, Flow system, Resonance, Sluice gates, Vortices, Surges, Standing waves, Flow-induced vibrations, Flow instability, Oscillations, Cylinders.

A scheme was presented for classifying problems of flow-induced vibrations according to basic types of excitation (extraneously, instability-, and movement-induced excitation) and basic flow modules. It was shown that vibrations in a complex system can be treated by a lumped-parameter approach using oscillator equations for the structures or structural parts, the unstable flows, and the possible fluid oscillators (surges or standing waves) within the system. A valve-conduit-surge-tank system was used to exemplify that this approach can be applied to assess dangerous spots and operating conditions in a system, to formulate vibration-prevention measures, and to analyze the first-order system behavior. The drawbacks of the current oscillator models are mainly due to their heuristic derivation and the necessary trial-and-error adjustments to available experimental evidence. An important task for future research would be to attempt a derivation of the flow- and fluid-oscillator models as a function of clearly identifiable flow processes and flow/structure interactions. TRANSPORT PROCESSES OF PARTICLES IN NON-DILUTE SUSPENSIONS IN TURBULENT WATER FLOW- PHASE I: EXPERIMENTAL MEASUREMENTS,
Illinois Univ. at Urbana-Champaign. Dept. of Nuclear Engineering.

B. G. Jones, and J. E. Gronager.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-180946, Price codes: A09 in paper copy, A01 in microfiche. Water Resources Center, University of Illinois Research Report No 148, March 1980. 189 p, 76 Fig, 10 Tab, 37 Ref. OWRT A-085-ILL(1), 14-34-001-8015.

Descriptors: *Turbulent transport, *Dispersion, *Sedimentation, *Slurry, *Particle suspension, Turbulent flow, Particle shape, Particle size, Particle transport, Model studies, Suspended solids.

Increased utilization of non-dilute, solid-fluid suspensions in transporting materials and in estimating the distribution of particles from atmospheric fallout, demands that the basic fluid-particle interactions be thoroughly understood. Our previous studies of such interactions were conducted only on dilute suspensions, where as this study has been conducted in the same vertical flows but with solid spherical particle suspensions with concentrations, phi, from 0 to 10 percent by volume, a range of practical interest to sedimentation and erosion as well as in slurry pipelines. Detailed experimental results of the particle-fluid relative mean and rms velocities as well as particle dispersion were obtained for two particle densities and several phi values. Both particle types showed a rapid rise of both relative mean and rms velocities as phi increased to about 1-2 percent and fell off gradually for higher phi values. Dispersion followed a similar behavior. The higher free fall velocity particles exhibited larger rms velocities and increased dispersion from the lighter, lower free fall velocity particles. Analytical models of the phi-dependence showed good agreement with the data, suggesting their use in engineering predictions.

Descriptors: *Drainage systems, *Sewers, *Storm drains, *Unsteady flow, Computer models, Pipe flow, Conduit flow, Flood routing, Hydraulics, Hydrographs, Mathematical models, Open-channel flow, Sewer systems, Storm runoff, Urban drainage, Urban runoff.

Surcharge of a sewer is the situation in which the sewer entrance and exittare submerged and the pipe is flowing full and under pressure. In this report the hydraulics of the surcharged flow as well as the open-channel flow leading to and after surcharge is discussed in detail and formulated mathematically. The transition between open-channel and surcharge flows is also discussed. This information is especially useful for those who intend to make accurate advanced simulation of sewer flows. In this study an approximate kinematic wave - surcharge model called SURKNET is formulated to simulate open-channel and surcharge flow of storm runoff in a sewer system. An example application of the model on a hypothetical sewer system is presented.

DEEP EXCAVATION IN PUERTO RICO IS DEWATERED,
Paniagua, Rodriguez, Garcia and Crumley, San Juan, PR.
A. R. Crumley.
The Johnson Driller's Journal, Vol 51, No 6, p 4-6, November-December, 1979. 3 Fig.

Descriptors: *Dewatering, *Excavation, *Well points, *Puerto Rico, Water wells, Water table, Artesian aquifers, Drainage, Permeability, Aquifer testing.

Seven, deep, high-capacity wells were used to dewater an excavation 43 feet below the ground water table. In-situ testing of site permeability revealed variations by several orders of magnitude. This necessitated full-scale pumping tests lasting for seven days. These tests indicated that certain sections of the aquifer were under artesian conditions. Thus, during excavation pockets of trapped water were encountered. The number of wells and the pumping rate from each were carefully adjusted to attain optimum performance. Seven, 80-feet-deep, 12-inch-diameter wells were installed, each pumping 1200 gpm. Wire-wound stainless steel screens were used due to high flow rates and the possibility of corrosion and incrustation. Seven diesel pumps were maintained daily to ensure that at least six were always in operation. Final flows with the excavation fully dewatered were 800 gpm per well. (Purdin-NWWA)

EARLY PRESSURE SYSTEMS: THE WATER RAM,
Ridgetown Coll. of Agricultural Tech. (Ontario).
C. S. Baldwin.
Canadian Water Well, Vol 6, No 1, p 25, February, 1980. 1 Fig.

Descriptors: *Hydraulic ram, *Pumps, Water storage, Costs, Maintenance.

The water ram is a device for pumping water by means of waterpower connected with a spring, pond or creek with a minimum flow of 1 1/2 gallons per minute and a minimum fall of 18 inches. The ram can pump to a height of 25 feet for every foot of fall in the stream. Since the moving parts are minimal, the ram has low initial cost and runs for years without maintenance. Most of the cost is in the piping from the ram to a storage tank. (Purdin-NWWA)

SUBMERSIBLE PUMPS--FIELD SERVICE,
K. George.
Canadian Water Well, Vol 6, No 1, p 22-24, February, 1980. 5 Fig, 1 Tab.

Descriptors: *Submersible pumps, *Servicing, *Maintenance, Failure(Mechanics), Electric power failure, *Pumps, Electrical equipment, Water wells.

Submersible pumps have greater reliability and efficiency, are easier to install, and cost less than jet pumps and line shaft driven pumps. Most submersibles require little or no periodic maintenance. However, when service is required, a systematic above-ground checking procedure should be followed to avoid the cost of unnecessarily pulling the pump. Checking procedures are listed for the most frequent problems. Repeated failures of pump, cable or motor indicate installation problems which should be corrected. These common causes for failure are listed. Proper well construction and installation plus a well-designed submersible pumping system are necessary to ensure a reliable and lasting water supply. DESIGN OF A COST EFFECTIVE SOLAR POWERED WATER PUMP,
Utah Water Research Lab., Logan.
D. G. Chadwick.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182819, Price codes: A03 in paper copy, A01 in microfiche. Hydraulics and Hydrology Series UWRL/H-80/02, April 1980. 36 p, 33 Fig, 2 Tab, 2 Append. OWRT-A-036-UTAH(1), 14-34-0001-8047.

Descriptors: *Solar radiation, *Pumps, *Cost-benefit analysis, *Design criteria, Solar power, Water pumps, Technology, Testing.

The design and performance of a vacuum lift, solar powered water pump is discussed. The basic design consists of an expanding gaseous piston confined inside a chamber which is located in series with, and between, an inlet and an outlet check valve. The gas is generated by volatilizing cyclopentane or hexane. Four variations of this basic design concept were built and evaluated. The various features of each are discussed. Considerations in the choice of a cost-effective solar collector are also reviewed. Several of the more promising types of solar collectors were built and evaluated for use on the pump. A 70C heat source temperature is required to operate the pump if cyclopentane is used as the volatile fluid, 90C is required if hexane is used. The volatile fluid is not expended in the pumping process. The pumps constructed on this project have a capacity of approximately 6 liters/minute when pumped to a height of 2 meters. Two square meters of sunshine are sufficient to operate the pump.

A TECHNICAL EXAMINATION OF GROUND WATER GEOTHERMAL HEAT PUMP COMPONENTS,
Friedrich Air Conditioning and Refrigeration Co., Fort Lauderdale, FL.
W. M. Hughes.
Ground Water Heat Pump Journal, Vol 1, No 1, p 14-15, Spring, 1980. 2 Fig.

Descriptors: *Heat pump, *Design, *Equipment, Temperature control, Heating, Cooling, Coolants, Condenser, Evaporators, Valves, Ducts, Heat exchangers, Ground water.

The heat pump cycle allows the same ground water to be used as either a sink or a source depending on whether heating or cooling is required in the space. The reason that this can be done is that the heat is transferred into and out of a refrigerant (commonly Freon). A heat pump functions by first evaporating the Freon at low temperature (and pressure) in an evaporator where air is cooled. A compressor then compresses the cold vapor into a hot, high-pressure vapor. This hot vapor condenses into a warm liquid in a condenser. The heat that is released by the Freon goes into the water. The liquid Freon goes through an expansion device causing a drop in pressure and a corresponding temperature drop. Most heat pumps contain a reversing valve which changes the routing of the Freon inside the unit so that either heating or cooling can be produced. A blower draws the return air through a filter and over the coil and discharges the cooled or heated air into the ductwork where it is distributed throughout the building. Optional heat pump components include an auxiliary electric resistance heating unit for supplementary or backup heat and a desuperheater water heater. (Purdin-NWWA)

USING NONMETALLIC CASING FOR GEOTHERMAL WELLS,
National Water Well Association, Worthington, OH.
W. H. Purdin.
Water Well Journal, Vol 34, No 4, p 90-91, April,

1980. 1 Tab.

Descriptors: *Well casings, *Plastic pipe, *Geothermal studies, *Drilling, Wells, Physical properties, Thermal properties, Chemical properties, Cost comparisons, Corrosion control, Rotary drilling, Collapse, Safety.

Various nonmetallic well casings can be used to help reduce the cost of installation maintenance and replacement of geothermal wells. The physical, thermal, and chemical properties and costs of these casings are compared. Thermoplastic casings cost less and have greater chemical resistance but less thermal resistance and structural strength than thermosetting plastic casings. Of the 'nonplastic' casings, polymer concrete has the best rating. The many advantages of these materials far outweigh their disadvantages. Because of their light weight, drilling cost is reduced. In some cases, the cost of the casing may be less than half as much as steel casing. Drilling geothermal wells and installing nonmetallic casing requires special precautions. Cable tool rigs should not be used with nonmetallic casing since it can't be driven. Casing can collapse due to bridging and subsequent collapse of the gravel pack, heat of hydration during grouting, or surging during development. Also, it may perform well for several years but suddenly collapse due to ground subsidence or high formation temperatures. Several steps are outlined to avoid collapse. (Purdin-NWWA)

AQUATIC STUDIES OF THE YELLOWSTONE RIVER,
Montana Fish and Game Dept., Helena. Environment and Information Div.
P. J. Graham, R. F. Penkal, and L. Peterman.
Report No REC-ERC-79-8, July 1979. 88 p, 60 Fig, 12 Tab, 39 Ref, 2 Append.

Descriptors: *Fish migration, *Sauger, *Walleye, *Diversion structures, Spawning, Fish barriers, Fish behavior, Fish populations, Fish passages, Fish reproduction, Electro-fishing, Turbulence, Streamflow, Regulated flow, Yellowstone River(Mont), Montana.

The effects of streamflow alterations on sauger and walleye populations in the lower Yellowstone River were studied. These fish were selected for the study due to their movement related to spawning, feeding, over-wintering, and other biological activities. The lower half of the river from the mouth of the Big Horn River downstream to the North Dakota border was the area investigated. There are two major diversions along this reach, the Forsyth diversion, a concrete structure across the entire river that creates a 0.5-m vertical drop, and the Intake diversion, a wooden structure covered by boulders extending across the main channel creating a turbulent 1.2-m drop in 30-m. Both structures divert water for irrigation. Fish samples were taken both upstream and downstream from each diversion. Fish were collected by boom electrofishing from a flatbottomed aluminum boat. Fish length, mass, and sex were determined and the fish were tagged and released near the middle of each section. Fish tag return data were collected and grouped by fish recapture time. Results show that walleye migrated upstream to the Intake diversion, spawned, and went back downstream. Sauger similarity concentrated below each diversion but their migration over the Intake diversion was extensive. Few sauger and no walleye migrated over the 0.5-m vertical drop of the Forsyth diversion. Fish were progressively more abundant in downstream sections. Egg abundances were also studied. (Seigler-IPA)

Descriptors: *Public participation, *Social participation, *Training, *Water resources development, Planning, Comprehensive planning, Social aspects, Political aspects, Universities.

Legislative mandates are increasingly assigning to water resources planning agencies the responsibility for conducting public participation programs. Few planning programs, however, have the resources to employ professionals with specialized training in the types of skills that are crucial to successful public participation programming, and planners themselves are often required to perform this function in addition to other duties. This project has documented the extent of this situation through a survey of planners in Coastal Zone Management and '208' programs in New England. The survey also determined these practitioners' educational and experiential preparation for performing public participation functions, as well as their own perceptions of the relative importance of those functions and the adequacy with which they were carried out. The research indicates that prior experience is more directly related to perceived adequacy than either academic or experiential background and therefore concludes that all planners should receive, as part of their professional preparation, specific training that will give them a viable substitute for this experience before they begin their professional careers. Recommendations for such a curriculum, stressing the importance of the development of public communications skills, are provided. (Godfrey-Mass)

10. SCIENTIFIC AND TECHNICAL INFORMATION

10C. Secondary Publication And Distribution

NOTES ON SEDIMENTATION ACTIVITIES CALENDAR YEAR 1978.
Geological Survey, Reston, VA.
January 1980. 244 p.

Descriptors: *Sedimentation, *Data collections, *Water Resources Development, *Federal government, Tennessee Valley Authority, Engineering, Research and Development, Publications, Water resources, Sediment control, Sediment transport, Dredging, Desilting.

Information in the field of sedimentation on: the activities of Federal agencies, work in progress or planned, important findings, new methods, new publications, laboratory and other research activities, and other pertinent data are reported for 1978. The report is organized by 21 major drainage areas in the conterminous United States, Alaska, Hawaii, Puerto Rico, and some foreign areas. Departments and agencies involved in sedimentation activities include: in the Department of Agriculture, the Forest Service, the Science and Education Administration, and the Soil Conservation Service; in the Department of the Army, the Corps of Engineers; in the Department of Commerce, the National Oceanic and Atmospheric Administration; in the Department of Energy, the Federal Energy Regulatory Commission; in the Department of the Interior, the Bureau of Mines, the Bureau of Reclamation, and the Geological Survey; in the Department of Transportation, the Federal Highway Administration; and the Tennessee Valley Authority. Not all agencies are active in all regions. A map illustrating the water resources regions of the United States is included. (Seigler-IPA)

The Role of Water in the History and Development of Colorado,
W80-04931 6E

COLUMBIA GLACIER (ALASKA)
Columbia Glacier Stake Location, Mass Balance, Glacier Surface Altitude, and Ice Radar Data, 1978 Measurement Year,
W80-04855 2C

COLUMBIA RIVER
A Preliminary Feasibility Study to Irrigate Western Umatilla and Northeastern Morrow Counties, Oregon.
W80-05017 6G

COMMERCIAL SHELLFISH
Relationship Between the Body Size of Principal Shellfish and the Concentration of Few Heavy Metals (In Japanese),
W80-04894 5B

COMPENSATION
A Comprehensive Oil Pollution Liability and Compensation Act: How Super is the 'Super Fund',
W80-04994 6E

COMPUTER MODELS
Simulation of Wetlands Forest Vegetation Dynamics,
W80-04860 2I

Flow Nets by the Finite Element Method,
W80-05058 7C

CONFERENCES
Proceedings of a Workshop on Alternative Wastewater Treatment Systems at Urbana-Champaign, Illinois, June 12-13, 1979.
W80-04936 5D

CONNECTICUT
Conflict of Interest Rules Applicable to Wetland Agency Members,
W80-04964 6E

CONSTITUTIONAL LAW
State and Local Wetlands Regulation in the Courts: Constitutional Problems on the Wane,
W80-04997 6E

Coastal Zone Management and State-Local Relations Under the Louisiana Constitution of 1974,
W80-04998 6E

CONSUMPTIVE USE
Global Water Law Systems and Water Control,
W80-04932 6E

CONTINENTAL SHELF
An Analysis of the Outer Continental Shelf Lands Act Amendments of 1978,
W80-04962 6E

Mariculture, The Law of the Continental Shelf and Offshore Oil Recovery: A Technology Affected by a Body of Law Effected by a Technology,
W80-04981 6E

Islands and the Delimitation of the Continental Shelf: A Framework for Analysis,
W80-05089 6E

COOLING WATER
Aquifers Store Energy.
W80-04940 3C

COPEPODS
Temperature and Adaptation to Pollution as Factors Influencing the Acute Toxicity of Cd to the Planktonic Copepod Acartia Clausi,
W80-04891 5A

COPPER
Influence of Copper and Zinc in Food Substance on the Accumulation of Cultured Oysters (In Japanese),
W80-04897 5B

Melimex, an Experimental Heavy Metal Pollution Study: Chemical Speciation and Biological Availability of Copper in Lake Water,
W80-04899 5B

Speciation and Rate of Loss of Copper from Lakewater with Implications to Toxicity,
W80-05034 5C

COPPER SULFATE
Influence of Copper Sulphate on the Structure of the Net of Larvae of Hydropsyche (Insecta, Trichoptera), (In French),
W80-04911 5C

COREGONUS
The Different Adaptability of Fish to Eutrophication, (In German),
W80-04912 5C

COST ANALYSIS
The Clean Water Act: Unexpected Impacts on Industry,
W80-04914 6E

Analysis of the Water Rate Structure as a Management Option for Water Conservation,
W80-05007 3D

COST-BENEFIT ANALYSIS
Design of a Cost Effective Solar Powered Water Pump,
W80-05011 8C

COST-SHARING
Efficiency Impacts of Cost Sharing on Shoreline Management,
W80-04917 6E

COX HOLLOW LAKE (WI)
Effects of Hypolimnetic Aeration on Nitrogen Transformations in Simulated Lake Sediment-Water Systems,
W80-05031 5C

CROP RESPONSE
Corn Response to Ammoniacal Nitrogen Under Varying Levels of Magnesium and Potassium Fertility,
W80-04871 3F

CRUSTACEANS
Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Load on Crustacea Plankton,
W80-04903 5C

CYANOPHYTA
Chloride Uptake by Anacystis Nidulans (Cyanophyceae),
W80-05023 5C

CYTOLOGICAL STUDIES
Chloride Uptake by Anacystis Nidulans (Cyanophyceae),
W80-05023 5C

DAM POLICY
Dam Policy in Massachusetts,
W80-05014 6E

DAMAGES
Private Actions for Damages Resulting from Offshore Oil Pollution,
W80-04968 6E

A Comprehensive Oil Pollution Liability and Compensation Act: How Super is the 'Super Fund',
W80-04994 6E

DAMS
The Effect of Dam Closure on Downstream Rapids,
W80-04820 2E

Knik Glacier, Alaska, May 1979 Monument and Glacier Survey,
W80-04863 7C

Dam Policy in Massachusetts,
W80-05014 6E

DATA COLLECTIONS
Sediment Transport by the White River Into Mud Mountain Reservoir, Washington, June 1974-June 1976,
W80-04857 2J

Notes on Sedimentation Activities Calendar Year 1978.
W80-04882 10C

Seasonal Distribution and Abundance of Marine Birds in Alaska,
W80-05041 5C

Population Dynamics and Trophic Relationships of Marine Birds in the Gulf of Alaska and Southern Bering Sea. Part 11: Notes on the Winter Seabirds of Chiniak Bay, Kodiak Island, Alaska,
W80-05050 5B

DATA PRESENTING
Techniques for Exploring and Presenting Data Applied to Lake Phosphorus Concentration,
W80-04843 7C

DATA PROCESSING
Techniques for Exploring and Presenting Data Applied to Lake Phosphorus Concentration,
W80-04843 7C

DATING
Cultural Resource Survey and Testing at the Mcgee Creek Project, Oklahoma,
W80-04881 6B

DECIDUOUS TREES
Forests and Flooding with Special Reference to the White River and Ouachita River Basins, Arkansas,
W80-04854 2I

DENITRIFICATION
Seasonal Variation of Denitrification Rate in Sediment Determined by Use of N15,
W80-05027 5C

DENSITY
The Rotation of a Vertical Interface in a Porous Medium,
W80-04829 2F

DEPURATION
Concentration and Distribution of Uranium in Mytilus Edulis and Associated Materials,
W80-04895 5B

DESALINATION PROCESSES
Development of Reverse Osmosis Membrane for Seawater Desalination,
W80-04802 3A

DESERTS
Development of a Self-Sealing Sampler for Ephemeral Wadi Floods,
W80-04830 7B

DESIGN
Application of Continuous Hydrologic Modeling to Evaluate and Design Wastewater Land Disposal or Evaporation Systems,
W80-04804 3C

A Technical Examination of Ground Water Geothermal Heat Pump Components,
W80-05051 8C

DESIGN CRITERIA
Design of a Cost Effective Solar Powered Water Pump,
W80-05011 8C

DETENTION RESERVOIRS
Settleability of Urban Runoff Pollution,
W80-04807 5G

DEVILS HOLE AREA (NEV)
Water-Resources Data Collected in the Devils Hole Area, Nye County, Nevada 1976-77,
W80-04853 4B

DEWATERING
Deep Excavation in Puerto Rico is Dewatered.
W80-04944 8B

DIFFUSION
Diffusion of a Passive Scalar with Random Advection,
W80-04821 5B

The Determination of Eddy Diffusion Coefficients Using Natural Tracers,
W80-04841 5B

DINOFLAGELLATES
First Record of a Bloom of Gonyaulax Monilata in Coastal Waters of Mississippi,
W80-04892 5A

DIPTERA
Melimex, an Experimental Heavy Metal Pollution Study: Oligochaetes and Chironomid Larvae in Heavy Metal Loaded and Control Limno-Corrals,
W80-04902 5B

DISCHARGE MEASUREMENT
Discharge Data at Water-Quality Monitoring Stations in Arkansas, 1978 Water Year,
W80-04851 7A

DISPERSION
An Analysis of Hydrodispersive Transfer in Aquifers,
W80-04822 2F

Dispersion in Two-Layer Stratified Water Bodies,
W80-04833 2L

The Determination of Eddy Diffusion Coefficients Using Natural Tracers,
W80-04841 5B

Transport Processes of Particles in Non-Dilute Suspensions in Turbulent Water Flow- Phase I: Experimental Measurements,
W80-04866 8B

DISSOLVED OXYGEN
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for Silver Creek, Clark and Floyd Counties, Indiana,
W80-04861 5B

DIVERSION STRUCTURES
Aquatic Studies of the Yellowstone River,
W80-04880 8I

DRAINAGE SYSTEMS
Surcharge of Sewer Systems,
W80-04867 5B

DREDGING
Federal Control of Wetlands: The Effectiveness of Corps' Regulations Under Section 404 of the FWPCA,
W80-05005 6E

DRILLING
Drilling for Energy Alternatives.
W80-04949 3C

Improving Yields of Open Wells in Consolidated Rocks Using Extension Drilling Techniques,
W80-05057 8A

Using Nonmetallic Casing for Geothermal Wells,
W80-05063 8G

Water District's Needs are Met,
W80-05082 4B

DRINKING WATER TREATMENT
A Rational Approach to Utilization of Carbon Beds in Reducing Microorganic Contamination in Drinking Water,
W80-05013 5F

DROUGHTS
Influence of Summer Drought on the Population of Aquatic Insects in a Temporary Salt-Marsh in the Crau District (Mouth of the River Rhone) (In French),
W80-04907 5C

DUG WELLS
Improving Yields of Open Wells in Consolidated Rocks Using Extension Drilling Techniques,
W80-05057 8A

EARTH FISSURES
Measurement, Prediction, and Hazard Evaluation of Earth Fissures and Subsidence, South-Central Arizona,
W80-05006 2F

ECOLOGY
Beaufort Sea Barrier Island-Lagoon Ecological Process Studies. Section I - Avian Ecology in Simpson Lagoon, Beaufort Sea, Alaska,
W80-04956 5C

Beaufort Sea Barrier Island-Lagoon Ecological Process Studies. Ecology of Invertebrates in Simpson Lagoon, Beaufort Sea, Alaska,
W80-04958 5C

The Breeding Biology of Marine Birds Associated with Chiniak Bay, Kodiak Island, 1975-1978,
W80-05043 5B

The Pelagic Birds of Tuxedni Wilderness, Alaska,
W80-05045 5C

Reproductive Ecology of Seabirds at Middleton Island, Alaska,
W80-05046 5B

The Winter Feeding Habits of Selected Species of Marine Birds in Kachemak Bay, Alaska,
W80-05047 5B

Nearshore Feeding Ecology of Marine Birds in the Kodiak Area, 1978,
W80-05048 5C

Population Dynamics and Trophic Relationships of Marine Birds in the Gulf of Alaska and Southern Bering Sea. Part 6: Populations and Ecology of Seabirds of the Koniuji Group, Shumagin Islands, Alaska,
W80-05049 5C

Population Dynamics and Trophic Relationships of Marine Birds in the Gulf of Alaska and Southern Bering Sea. Part 11: Notes on the Winter Seabirds of Chiniak Bay, Kodiak Island, Alaska,
W80-05050 5B

ECONOMIC EFFICIENCY
Management of Summer-Seasonal Irrigation Water in Beef Cow/Calf Agriculture in the Sierra Nevada Foothills,
W80-04803 3F

ECONOMIC FEASIBILITY
Management of Summer-Seasonal Irrigation Water in Beef Cow/Calf Agriculture in the Sierra Nevada Foothills,
W80-04803 3F

ECONOMIC IMPACT
The Clean Water Act: Unexpected Impacts on Industry,
W80-04914 6E

Port Authorities View State Coastal Management Programs,
W80-05094 6E

ECONOMIC JUSTIFICATION
A Theoretical Analysis of Minute 242,
W80-04988 6E

ECOSYSTEMS
A Consideration of Trophic Dynamics in Some Tallgrass Prairie Farm Ponds,
W80-05025 5C

Key Organisms in Benthic Food Webs and Their Relationship to Important Habitats in Lower Cook Inlet,
W80-05053 5C

Distribution, Abundance, Community Structure and Trophic Relationships of the Nearshore Benthos of the Kodiak Shelf,
W80-05054 5C

Environmental Assessment of Selected Habitats in the Beaufort and Chukchi Littoral System,
W80-05056 5C

EFFECTS
The Influence of Land-Use Change on Water Resources,
W80-04873 4C

ENERGY
Offshore Siting of Nuclear Power Plants,
W80-04942 5B

Law of the Sea: Its Impact on the International Energy Crisis,
W80-05002 6E

ENERGY CONVERSION
Including Geothermal Resources Within the Mineral Estate: The Need for a Statutory Rule of Presumption,
W80-05088 6E

ENERGY DISSIPATION
Force Fluctuations on Sill of Hydraulic Jump,
W80-04834 8B

ENERGY SOURCES
Offshore Siting of Nuclear Power Plants,
W80-04942 5B

ENERGY STORAGE
Aquifers Store Energy.
W80-04940 3C

ENTRAINMENT
Vertical Mixing Induced by Wind and a Rotating Screen in a Stratified Fluid in a Channel,
W80-04837 2H

ENVIRONMENTAL CONTROL
Growth of Subterranean Clover in a Range Soil as Affected by Microclimate and Phosphorus Availability. III. Comparative Growth of Sub-

terranean and Rose Clovers at Cold Soil Temperatures,
W80-04814 3F

ENVIRONMENTAL EFFECTS
Sublethal Effects of Petroleum Hydrocarbons and Trace Metals, Including Biotransformations, as Reflected by Morphological, Chemical, Physiological, Pathological, and Behavioral Indices,
W80-04954 5C

Beaufort Sea Barrier Island-Lagoon Ecological Process Studies. Section I - Avian Ecology in Simpson Lagoon, Beaufort Sea, Alaska,
W80-04956 5C

Beaufort Sea Barrier Island-Lagoon Ecological Process Studies. Ecology of Invertebrates in Simpson Lagoon, Beaufort Sea, Alaska,
W80-04958 5C

Obstacles to Geothermal Development,
W80-04983 5C

ENZYMES
Application of Enzyme Methods to the Determination of Pollutants in Water,
W80-04868 5A

EQUIPMENT
A Technical Examination of Ground Water Geothermal Heat Pump Components,
W80-05051 8C

EROSION
Measurement, Prediction, and Hazard Evaluation of Earth Fissures and Subsidence, South-Central Arizona,
W80-05006 2F

Nutrients Dynamics in Nearshore Alaskan Beaufort Sea Waters,
W80-05060 5C

ERYTHROCYTES
Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--1. The Methemoglobin-Formation by the Nitroso-Derivatives in White-Spotted Char, Salvelinus Leucomaenis, Erythrocytes,
W80-04889 5B

Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--II. Production of Methemoglobin-Forming Metabolites of the Amino-Derivatives by White-Spotted Char, Salvelinus Leucomaenis, Liver Homogenate,
W80-04890 5B

ESTIMATING EQUATIONS
Intervention Analysis with Missing Data,
W80-04823 7C

ESTUARIES
Trace Metals in Suspended Particulates, Biota, and Sediments of the St. Croix, Narraguagus, and Union Estuaries and the Goose Cove Region of Penobscot Bay,
W80-04809 5B

Estuarine Sanctuaries - The Oregon Experience,
W80-04922 6E

EUTROPHICATION
The Different Adaptability of Fish to Eutrophication, (In German),
W80-04912 5C

Lake Ecosystems: A Polyhedral Dynamics Representation,
W80-05040 5C

EVALUATION
Determination of Trace Elements in Natural Waters by the D.C. Argon Plasma, Multielement Atomic Emission Spectrometer (DCP-MAES) Technique,
W80-04858 7B

EXCAVATION
Deep Excavation in Puerto Rico is Dewatered,
W80-04944 8B

EXPERIMENTAL FORMS
Corn Response to Ammoniacal Nitrogen Under Varying Levels of Magnesium and Potassium Fertility,
W80-04871 3F

FAILURE (MECHANICS)
Well Maintenance Programs Can Prevent Failures,
W80-05084 8A

FAIRBANKS (ALASKA)
Arsenic, Nitrate, Iron, and Hardness in Ground Water, Chena Ridge Vicinity, Fairbanks Area, Alaska,
W80-04862 5B

FARM PONDS
A Consideration of Trophic Dynamics in Some Tallgrass Prairie Farm Ponds,
W80-05025 5C

FARM WASTES
Development of Animal Waste Facilities for Minimizing Water Pollution,
W80-04811 5E

FEASIBILITY STUDIES
A Preliminary Feasibility Study to Irrigate Western Umatilla and Northeastern Morrow Counties, Oregon.
W80-05017 6G

FEDERAL GOVERNMENT
Notes on Sedimentation Activities Calendar Year 1978.

FISHERIES
Foreign Access to U.S. Fisheries in the Wake of the Fishery Conservation and Management Act,
W80-04970 6E

United States Policy with Respect to High Seas Fisheries and Deep Seabed Minerals - A Study in Contracts,
W80-04976 6E

Distribution, Abundance, Community Structure and Trophic Relationships of the Nearshore Benthos of Cook Inlet and Negoa,
W80-05052 5C

FISHING
Fishing and North Sea Oil,
W80-04941 5C

FISSURES (GEOLOGIC)
Measurement, Prediction, and Hazard Evaluation of Earth Fissures and Subsidence, South-Central Arizona,
W80-05006 2F

FIXED BED ADSORBERS
A Rational Approach to Utilization of Carbon Beds in Reducing Microorganic Contamination in Drinking Water,
W80-05013 5F

FLOATING NUCLEAR PLANTS (FNPS)
Offshore Siting of Nuclear Power Plants,
W80-04942 5B

FLOOD CONTROL
Flood Control and Arizona,
W80-05078 6E

FLOOD FREQUENCY
Simulation of Wetlands Forest Vegetation Dynamics,
W80-04860 2I

FLOOD PLAIN ZONING
Flood Control and Arizona,
W80-05078 6E

FLOOD PROTECTION
Efficiency Impacts of Cost Sharing on Shoreline Management,
W80-04917 6E

Flood Control and Arizona,
W80-05078 6E

FLOOD ROUTING
New Routing Model for Continuous Runoff Simulation,
W80-04831 2E

FLOODS
Development of a Self-Sealing Sampler for Ephemeral Wadi Floods,
W80-04830 7B

Forests and Flooding with Special Reference to the White River and Ouachita River Basins, Arkansas,
W80-04854 2I

FLORIDA
Water Resources Data for Florida, Water Year 1978--Volume 2A-1. South Florida Surface Water.
W80-04847 7C

Water Resources Data for Florida, Water Year 1978--Volume 2A-2. South Florida Surface Water Quality.
W80-04848 7C

Water Resources Data for Florida, Water Year 1978--Volume 2B. South Florida Ground Water.
W80-04849 7C

Water Resources Data for Florida, Water Year 1978--Volume 4. Northwest Florida.
W80-04850 7C

Generalized Thickness of the Surficial Deposits Above the Confining Bed Overlying the Floridan Aquifer, Southwest Florida Water Management District,
W80-04864 2F

Laying the Foundation for Sophisticated Environmental Strategies: A Florida Case Study,
W80-04969 6E

Deep Well Injection for Florida Effluent.
W80-04984 5B

Florida and Coastal Zone Management,
W80-05100 6E

FLORIDAN AQUIFER
Generalized Thickness of the Surficial Deposits Above the Confining Bed Overlying the Floridan Aquifer, Southwest Florida Water Management District,
W80-04864 2F

FLOW AROUND OBJECTS
Oscillator-Model Approach to the Identification and Assessment of Flow-Induced Vibrations in a System,
W80-04838 8B

FLOW CHARACTERISTICS
Experimental Determination of the Velocity Gradient in Two Dimensional Turbulent Flow,
W80-04836 8B

FLOW CONTROL
Oscillator-Model Approach to the Identification and Assessment of Flow-Induced Vibrations in a System,
W80-04838 8B

FLOW NETS
Flow Nets by the Finite Element Method,
W80-05058 7C

FLOYD COUNTY (IND)
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for Silver Creek, Clark and Floyd Counties, Indiana,
W80-04861 5B

FLUORESCENT DYE
Pyranine Used as a Fluorescent Tracer in Hydrology: PH Effects in Determination of Its Concentration,
W80-04846 7B

FLY ASH
The Uptake of Chemical Elements from Coal Ash and Settling Basin Effluent by Primary Producers I. Relative Concentrations in Predominant Plants,
W80-05038 5C

FOOD CHAINS
Melimex, an Experimental Heavy Metal Pollution Study: Behaviour of Heavy Metals in an Aquatic Food Chain,
W80-04900 5B

A Consideration of Trophic Dynamics in Some Tallgrass Prairie Farm Ponds,
W80-05025 5C

Population Dynamics and Trophic Relationships of Marine Birds in the Gulf of Alaska and Southern Bering Sea. Part 6: Populations and Ecology of Seabirds of the Koniuji Group, Shumagin Islands, Alaska,

W80-05047 5B

Nearshore Feeding Ecology of Marine Birds in the Kodiak Area, 1978,
W80-05048 5C

FOOD PYRAMIDS
A Consideration of Trophic Dynamics in Some Tallgrass Prairie Farm Ponds,
W80-05025 5C

FOOD WEBS
Key Organisms in Benthic Food Webs and Their Relationship to Important Habitats in Lower Cook Inlet,
W80-05053 5C

Distribution, Abundance, Community Structure and Trophic Relationships of the Nearshore Benthos of the Kodiak Shelf,
W80-05054 5C

Environmental Assessment of Selected Habitats in the Beaufort and Chukchi Littoral System,
W80-05056 5C

FORECASTING
Linearized Subhydrograph Routing of Direct Runoff,
W80-04813 2A

Multivariate Short-Term Rainfall Prediction,
W80-04824 2B

On a Model of a Nonlinear Feedback System for River Flow Prediction,
W80-04828 2E

Columbia Glacier Stake Location, Mass Balance, Glacier Surface Altitude, and Ice Radar Data, 1978 Measurement Year,
W80-04855 2C

FOREIGN COUNTRIES
Coastal Land Use Control in Sweden,
W80-04920 6E

Foreign Access to U.S. Fisheries in the Wake of the Fishery Conservation and Management Act,
W80-04970 6E

FOREST FOLIAGE
Water Storage on Forest Foliage: A General Model,
W80-04826 2I

FOREST MANAGEMENT
Suspended Sediment from Forest Road Construction,
W80-04808 4D

FORESTS
Water Storage on Forest Foliage: A General Model,
W80-04826 2I

Forests and Flooding with Special Reference to the White River and Ouachita River Basins, Arkansas,
W80-04854 2I

Simulation of Wetlands Forest Vegetation Dynamics,
W80-04860 2I

FOUNDATIONS
Precision Drilling for Dam Safety.
W80-05055 8A

FOURIER ANALYSIS
Wind-Driven Circulation in Small Shallow Lakes: Laboratory and Computational Experiments,
W80-04870 2H

GENERAL MODEL
Water Storage on Forest Foliage: A General Model,
W80-04826 2I

GEOGRAPHICAL REGIONS
Regional Arrangements in the Oceans,
W80-05083 6E

GEOHYDROLOGIC UNITS
Generalized Thickness of the Surficial Deposits Above the Confining Bed Overlying the Floridan Aquifer, Southwest Florida Water Management District,
W80-04864 2F

GEOLOGICAL SURVEY
Wisconsin, a Summary of Activities and Plans of the United States Department of the Interior, Geological Survey, 1979.
W80-04859 7C

GEOMORPHOLOGY
The Effect of Dam Closure on Downstream Rapids,
W80-04820 2E

Forests and Flooding with Special Reference to the White River and Ouachita River Basins, Arkansas,
W80-04854 2I

Beaufort Sea Barrier Island-Lagoon Ecological Process Studies. Oceanographic and Geologic Processes--A Synthesis of Ecologically Important Information,
W80-04959 5C

GEOPRESSURED AQUIFERS
Drilling for Energy Alternatives.
W80-04949 3C

GEOTHERMAL STUDIES
Drilling for Energy Alternatives.
W80-04949 3C

Obstacles to Geothermal Development,
W80-04983 5C

Using Nonmetallic Casing for Geothermal Wells,
W80-05063 8G

Including Geothermal Resources Within the Mineral Estate: The Need for a Statutory Rule of Presumption,
W80-05088 6E

GLACIAL AQUIFERS
Michigan Job Uses Geophysical Aids,
W80-04943 7B

GLACIERS
Columbia Glacier Stake Location, Mass Balance, Glacier Surface Altitude, and Ice Radar Data, 1978 Measurement Year,
W80-04855 2C

Knik Glacier, Alaska, May 1979 Monument and Glacier Survey,
W80-04863 7C

GLUCOSE
Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Load on Uptake of Glucose by Natural Planctonic Communities,
W80-04901 5B

A Study of Periphyton in a Polluted River (L'Agout) II. Metabolism and Dynamics of Growth on Artificial Substrata, (In French),
W80-04909 5C

GODAVARI RIVER (INDIA)
Chemical and Sediment Mass Transfer in the Godavari River Basin in India,
W80-04845 2J

GONYAULAX
First Record of a Bloom of Gonyaulax Monilata in Coastal Waters of Mississippi,
W80-04892 5A

GOVERNMENT FINANCE
Black-Listing the Polluters,
W80-05067 6E

GRANTS
Some Legal Issues in the Coastal Zone Management Act: Grant-In-Aid Aspects - Part One,
W80-05095 6E

GRAVITY STUDIES
Michigan Job Uses Geophysical Aids,
W80-04943 7B

GREAT LAKES
Pollution in the Great Lakes Basin from Land Use Activities.
W80-04879 5B

Oil Spills: A Coastal Resident's Handbook,
W80-04939 5C

GREENLAND
Freshwater Phytoplankton from the Narssaq Area, South Greenland,
W80-05018 2H

GROUND WATER
Smyrna, Delaware Solves a Water Problem,
W80-04923 5F

Shifting Emphasis to Ground Water,
W80-05059 5G

Bacteria: What's in the Water.,
W80-05064 8A

GROUND WATER MOVEMENT
Ground Water Flow Computations by Method of Lines,
W80-04950 7C

GROUND WATER RECHARGE
The Case for Artificial Recharge,
W80-05098 4B

GROUND WATER RESOURCES
Water District's Needs are Met,
W80-05082 4B

New Nationwide Hydrologic Investigations.
W80-05099 6A

GROUNDWATER
Water Resources Data for Florida, Water Year 1978--Volume 2B. South Florida Ground Water.
W80-04849 7C

Water Resources Data for Florida, Water Year 1978--Volume 4. Northwest Florida.
W80-04850 7C

Analysis of Ground Water by Different Laboratories -- A Comparison of Chloride and Nitrate Data, Nassau and Suffolk Counties, New York,
W80-04852 5A

Determination of Trace Elements in Natural Waters by the D.C. Argon Plasma, Multielement Atomic Emission Spectrometer (DCP-MAES) Technique,
W80-04858 7B

Arsenic, Nitrate, Iron, and Hardness in Ground Water, Chena Ridge Vicinity, Fairbanks Area, Alaska,
W80-04862 5B

The Influence of Land-Use Change on Water Resources,
W80-04873 4C

GROUNDWATER MOVEMENT
Organic Solute-Mineral Surface Interactions: A New Method for the Determination of Groundwater Velocities,
W80-04827 7B

GROUNDWATER RESOURCES
Water-Resources Data Collected in the Devils Hole Area, Nye County, Nevada 1976-77,
W80-04853 4B

Groundwater Augmentation Plans in Colorado,
W80-04928 6E

GROUNDWATER SUBUNITS
Map of the Antelope Valley-East Kern Water Agency Area, California, Showing Well Density in the Ground-Water Subunits and Areas,
W80-04865 7C

GROWTH RATES
Nutrient Interactions and Algal Quality in Cayuga Lake,
W80-04801 5C

Growth of Subterranean Clover in a Range Soil as Affected by Microclimate and Phosphorus Availability. III. Comparative Growth of Subterranean and Rose Clovers at Cold Soil Temperatures,
W80-04814 3F

A Study of Periphyton in a Polluted River (L'Agout) I. Structure and Development of Communities on Artificial Substrata. (In French),
W80-04908 5C

A Study of Periphyton in a Polluted River (L'Agout) II. Metabolism and Dynamics of Growth on Artificial Substrata, (In French),
W80-04909 5C

The Effect of Lead, Cadmium, and Mercury on the Increase in Length of Five Intertidal Fucales,
W80-04910 5C

LIBRARY OF THE [illegible]

GROWTH RATES

The Significance of Vitamins and the Epiphytic Bacterial Community in the Nutritional Ecology of Cladophora Glomerata,
W80-05008 5C

Phosphate-Limited Growth Kinetics of Selenastrum Capricornutum (Chlorophyceae),
W80-05024 5C

GROWTH STAGES

Influence of Summer Drought on the Population of Aquatic Insects in a Temporary Salt-Marsh in the Crau District (Mouth of the River Rhone) (In French),
W80-04907 5C

GULF OF CALIFORNIA

The Patrimonial Sea to the Rescue of the Gulf of California,
W80-04990 6E

GULF OF MEXICO

First Record of a Bloom of Gonyaulax Monilata in Coastal Waters of Mississippi,
W80-04892 5A

GULFS

The Patrimonial Sea to the Rescue of the Gulf of California,
W80-04990 6E

HABITAT

Key Organisms in Benthic Food Webs and Their Relationship to Important Habitats in Lower Cook Inlet,
W80-05053 5C

HABITATS

Beaufort Sea Barrier Island-Lagoon Ecological Process Studies. Section I - Avian Ecology in Simpson Lagoon, Beaufort Sea, Alaska,
W80-04956 5C

Population Dynamics and Trophic Relationships of Marine Birds in the Gulf of Alaska,
W80-05042 5B

HANDBOOK

Oil Spills: A Public Official's Handbook,
W80-04938 5C

Oil Spills: A Coastal Resident's Handbook,
W80-04939 5C

HARDNESS (WATER)

Arsenic, Nitrate, Iron, and Hardness in Ground Water, Chena Ridge Vicinity, Fairbanks Area, Alaska,
W80-04862 5B

HEAT PUMP

A Technical Examination of Ground Water Geothermal Heat Pump Components,
W80-05051 8C

HEAT PUMPS

The Legal Implications of Ground Water Heat Pump Use,
W80-04957 6E

HEATED WATER

Aquifers Store Energy.
W80-04940 3C

HEAVY METALS

An Avoidance Response Bioassay for Aquatic Pollutants,
W80-04806 5C

Trace Metals in Suspended Particulates, Biota, and Sediments of the St. Croix, Narraguagus, and Union Estuaries and the Goose Cove Region of Penobscot Bay,
W80-04809 5B

Relationship Between the Body Size of Principal Shellfish and the Concentration of Few Heavy Metals (In Japanese),
W80-04894 5B

Melimex, an Experimental Heavy Metal Pollution Study: Behaviour of Heavy Metals in an Aquatic Food Chain,
W80-04900 5B

Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Load on Uptake of Glucose by Natural Planctonic Communities,
W80-04901 5B

Melimex, an Experimental Heavy Metal Pollution Study: Oligochaetes and Chironomid Larvae in Heavy Metal Loaded and Control Limno-Corrals,
W80-04902 5B

Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Load on Crustacea Plankton,
W80-04903 5C

Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Loads on Phytoplankton Communities,
W80-04904 5C

Natural Distribution and Environmental Background of Trace Heavy Metals in Alaskan Shelf and Estuarine Areas,
W80-05066 5C

HERBICIDES

Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--1. The Methemoglobin-Formation by the Nitroso-Derivatives in White-Spotted Char, Salvelinus Leucomaenis, Erythrocytes,
W80-04889 5B

Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--II. Production of Methemoglobin-Forming Metabolites of the Amino-Derivatives by White-Spotted Char, Salvelinus Leucomaenis, Liver Homogenate,
W80-04890 5B

HISTORY

Cultural Resource Survey and Testing at the Mcgee Creek Project, Oklahoma,
W80-04881 6B

HOUGHTON LAKE (MI)

The Utilization of a Fresh-Water Wetland for Nutrient Removal from Secondarily Treated Waste Water Effluent,
W80-05033 5D

HUMAN POPULATION

Oil Spills: A Coastal Resident's Handbook,
W80-04939 5C

HYDRAULIC JUMP

Force Fluctuations on Sill of Hydraulic Jump,
W80-04834 8B

HYDRAULIC MODELS

Vertical Mixing Induced by Wind and a Rotating Screen in a Stratified Fluid in a Channel,
W80-04837 2H

HYDRAULIC RAM

Early Pressure Systems: The Water Ram,
W80-04952 8C

HYDRAULICS

Force Fluctuations on Sill of Hydraulic Jump,
W80-04834 8B

HYDRODYNAMICS

Oscillator-Model Approach to the Identification and Assessment of Flow-Induced Vibrations in a System,
W80-04838 8B

HYDROELECTRIC POWER

Dam Policy in Massachusetts,
W80-05014 6E

HYDROGEN ION CONCENTRATION

Pyranine Used as a Fluorescent Tracer in Hydrology: PH Effects in Determination of Its Concentration,
W80-04846 7B

Effect of Nitrification in Orta Lake,
W80-05026 5C

HYDROGRAPH ANALYSIS

Linearized Subhydrograph Routing of Direct Runoff,
W80-04813 2A

HYDROLOGIC BUDGET

The Use of the Climatic Water Budget in Water Resources Management and Control,
W80-04872 4A

Use of the Climatic Water Budget to Estimate Streamflow,
W80-04874 2A

The Use of the Water Budget in Evaluating Leaching Through Solid Waste Landfills,
W80-04875 5B

The Use of the Climatic Water Budget to Evaluate the Validity of a Precipitation Record,
W80-04877 7B

HYDROLOGIC DATA

Water Resources Data for Florida, Water Year 1978--Volume 2A-1. South Florida Surface Water.
W80-04847 7C

Water Resources Data for Florida, Water Year 1978--Volume 2A-2. South Florida Surface Water Quality.
W80-04848 7C

Water Resources Data for Florida, Water Year 1978--Volume 2B. South Florida Ground Water.
W80-04849 7C

Water Resources Data for Florida, Water Year 1978--Volume 4. Northwest Florida.
W80-04850 7C

HYDROLOGIC MODEL

Application of Continuous Hydrologic Modeling to Evaluate and Design Wastewater Land Disposal or Evaporation Systems,
W80-04804 3C

HYDROLOGY

Application of Continuous Hydrologic Modeling to Evaluate and Design Wastewater Land Disposal or Evaporation Systems,
W80-04804 3C

HYDROPSYCHE

Influence of Copper Sulphate on the Structure of the Net of Larvae of Hydropsyche (Insecta, Trichoptera), (In French),
W80-04911 5C

ICEBERGS

Columbia Glacier Stake Location, Mass Balance, Glacier Surface Altitude, and Ice Radar Data, 1978 Measurement Year,
W80-04855 2C

ICED LAKES

Winter Limnological Conditions in a Prairie Pothole Lake and the Application of Molecular Oxygen,
W80-04812 2H

ILLINOIS

Managing Recreational Rivers,
W80-04935 6E

Proceedings of a Workshop on Alternative Wastewater Treatment Systems at Urbana-Champaign, Illinois, June 12-13, 1979.
W80-04936 5D

Federal Jurisdiction and Federal Common Law - Environmental Law - Public Nuisance Suits Concerning Interstate Water Pollution-Illinois V. City of Milwaukee, 406, U.S. 91 (1972),

INDIANA
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for Silver Creek, Clark and Floyd Counties, Indiana,
W80-04861 5B

INDUSTRIAL PRODUCTION
The Clean Water Act: Unexpected Impacts on Industry,
W80-04914 6E

INDUSTRIAL WASTES
Effect of Nitrification in Orta Lake,
W80-05026 5C

INFILTRATION
Infiltration Under Rapidly Varying Surface Water Depths,
W80-04817 2G

INGENOUS ROCKS
Borehole Geophysics in Igneous and Metamorphic Rocks,
W80-04887 4B

INHIBITION
Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Load on Uptake of Glucose by Natural Planctonic Communities,
W80-04901 5B

INJECTION WELLS
Deep Well Injection for Florida Effluent.
W80-04984 5B

Effluent Disposal Methods,
W80-05019 8A

INNOVATIVE TREATMENT
Proceedings of a Workshop on Alternative Wastewater Treatment Systems at Urbana-Champaign, Illinois, June 12-13, 1979.
W80-04936 5D

INSECTS
Influence of Summer Drought on the Population of Aquatic Insects in a Temporary Salt-Marsh in the Crau District (Mouth of the River Rhone) (In French),
W80-04907 5C

Influence of Copper Sulphate on the Structure of the Net of Larvae of Hydropsyche (Insecta, Trichoptera), (In French),
W80-04911 5C

INSOLUBLE POLYMERS
The Selective Removal of Nitrate and Nitrite from Polluted Waters,
W80-04869 5F

INSPECTION
Administrative Water Rights Inspections in California,
W80-05000 6E

INSTRUMENTATION
Experimental Determination of the Velocity Gradient in Two Dimensional Turbulent Flow,
W80-04836 8B

A New Measuring Device for Quickly Varying Liquid Levels (Principe D'un Nouveau Dispositif de Mesure des Niveaux de Liquides),
W80-04839 7B

INTERFACES
The Rotation of a Vertical Interface in a Porous Medium,
W80-04829 2F

A New Measuring Device for Quickly Varying Liquid Levels (Principe D'un Nouveau Dispositif de Mesure des Niveaux de Liquides),
W80-04839 7B

INTERMITTENT STREAMS
Development of a Self-Sealing Sampler for Ephemeral Wadi Floods,
W80-04830 7B

INTERNATIONAL COMMISSIONS

Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter.
W80-05001 6E

Law of the Sea: Its Impact on the International Energy Crisis,
W80-05002 6E

Fisheries Jurisdiction-United States Fishery Conservation and Management Act of 1976, Public Law 94-265, 94th Congress, H.R. 200,
W80-05003 6E

United States Oceans Policy: Perspective 1974,
W80-05004 6E

The International Regime for the Deep Seabed: Past Conflicts and Proposals for Progress,
W80-05074 6E

Will There Be Law at Sea.
W80-05076 6E

The Third United Nations Conference on the Law of the Sea: The 1975 Geneva Session,
W80-05081 6E

Regional Arrangements in the Oceans,
W80-05083 6E

Political Cobwebs Beneath the Sea,
W80-05085 6E

Possible Solutions to the 200-Mile Territorial Limit,
W80-05087 6E

Islands and the Delimitation of the Continental Shelf: A Framework for Analysis,
W80-05089 6E

LAW OF THE SEAS
Fishery Conservation and Management Act of 1976: An Accommodation of State, Federal and International Interests,
W80-04933 6E

LEACHING
The Use of the Water Budget in Evaluating Leaching Through Solid Waste Landfills,
W80-04875 5B

LEAD
The Effect of Lead, Cadmium, and Mercury on the Increase in Length of Five Intertidal Fucales,
W80-04910 5C

LEGAL ASPECTS
The Legal Implications of Ground Water Heat Pump Use,
W80-04957 6E

Coal Slurry Transportation Systems and Related Water Rights and Water Quality Problems,
W80-04979 6E

Obstacles to Geothermal Development,
W80-04983 5C

LEGISLATION
Annual Review of Activities - 1975: Water Resources Committee, Arizona.
W80-04915 6E

LEGUMES
Growth of Subterranean Clover in a Range Soil as Affected by Microclimate and Phosphorus Availability. III. Comparative Growth of Subterranean and Rose Clovers at Cold Soil Temperatures,
W80-04814 3F

LENTIC ENVIRONMENT
Cellulose Production by Planktonic Algae in Lacustrine Environments,
W80-05032 5C

LIGANDS
Melimex, an Experimental Heavy Metal Pollution Study: Chemical Speciation and Biological Availability of Copper in Lake Water,
W80-04899 5B

LIMITING FACTORS
Short-Term Responses of Nutrient-Deficient Algae to Nutrient Addition,
W80-05022 5A

LIMNOLOGY
Winter Limnological Conditions in a Prairie Pothole Lake and the Application of Molecular Oxygen,
W80-04812 2H

LIMPETS
Cadmium, Zinc and Copper Accumulation in Limpets (Patella Vulgata) from the Bristol Channel with Special Reference to Metallothioneins,
W80-04893 5B

LINEAR PROGRAMMING
Management of Summer-Seasonal Irrigation Water in Beef Cow/Calf Agriculture in the Sierra Nevada Foothills,
W80-04803 3F

LINEARIZED SUBHYDROGRAPH ROUTING
Linearized Subhydrograph Routing of Direct Runoff,
W80-04813 2A

LITTORAL
Environmental Assessment of Selected Habitats in the Beaufort and Chukchi Littoral System,
W80-05056 5C

LOADS (FORCES)
Force Fluctuations on Sill of Hydraulic Jump,
W80-04834 8B

LOGGING (RECORDING)
Borehole Geophysics in Igneous and Metamorphic Rocks,
W80-04887 4B

LOUISIANA
An Evaluation of Louisiana Superport Studies and Implications for Coastal Zone Management,
W80-04926 6E

Drilling for Energy Alternatives.
W80-04949 3C

Coastal Zone Management and State-Local Relations Under the Louisiana Constitution of 1974,
W80-04998 6E

MAINE
Trace Metals in Suspended Particulates, Biota, and Sediments of the St. Croix, Narraguagus, and Union Estuaries and the Goose Cove Region of Penobscot Bay,
W80-04809 5B

The Application of Physical and Chemical Parameters to the Design of Raised Bed Soil Absorption Systems,
W80-04810 5D

MAINTENANCE
Submersible Pumps--Field Service,
W80-04953 8C

Well Maintenance Programs Can Prevent Failures,
W80-05084 8A

MAMMALS
Sea Otter Distribution and Abundance Southern Kodiak Archipelago and the Semidi Islands,
W80-04946 5C

Belukha Whales in Lower Cook Inlet,
W80-04947 5C

MANITOBA
Speciation and Rate of Loss of Copper from Lakewater with Implications to Toxicity,
W80-05034 5C

MAPS
Map of the Antelope Valley-East Kern Water Agency Area, California, Showing Well Density in the Ground-Water Subunits and Areas,
W80-04865 7C

MARINE ALGAE
Light Independent Carbon Fixation by Marine Macroalgae,
W80-05021 5C

MARINE FISHERIES
A 'Common Heritage' Approach to Fisheries Through Regional Controls,
W80-04960 6E

The Law of the Sea and Regional Fisheries Policy,
W80-04971 6E

Mariculture, The Law of the Continental Shelf and Offshore Oil Recovery: A Technology Affected by a Body of Law Effected by a Technology,
W80-04981 6E

Fishery Conservation and the Law of the Sea.
W80-04987 6E

Fisheries Jurisdiction-United States Fishery Conservation and Management Act of 1976, Public Law 94-265, 94th Congress, H.R. 200,
W80-05003 6E

Marine Resources Committee (Annual Review of Activities - 1975).
W80-05086 6E

MASS TRANSFER
Chemical and Sediment Mass Transfer in the Godavari River Basin in India,
W80-04845 2J

MASSACHUSETTS
Dam Policy in Massachusetts,
W80-05014 6E

MASSACHUSETTS BAY
Dispersion in Two-Layer Stratified Water Bodies,
W80-04833 2L

MATHEMATICAL MODELS
An Analysis of Hydrodispersive Transfer in Aquifers,
W80-04822 2F

Intervention Analysis with Missing Data,
W80-04823 7C

Water Storage on Forest Foliage: A General Model,
W80-04826 2I

Dispersion in Two-Layer Stratified Water Bodies,
W80-04833 2L

Theoretical Approach to Prediction of Local Scour Around Bridge Piers,
W80-04835 2J

Self-Purification of Rivers a Two-Phase Model for Bacterial Biodegradation,
W80-05028 5F

MEASUREMENT
A New Measuring Device for Quickly Varying Liquid Levels (Principe D'un Nouveau Dispositif de Mesure des Niveaux de Liquides),
W80-04839 7B

Columbia Glacier Stake Location, Mass Balance, Glacier Surface Altitude, and Ice Radar Data, 1978 Measurement Year,
W80-04855 2C

MEMBRANE PROCESSES
Development of Reverse Osmosis Membrane for Seawater Desalination,
W80-04802 3A

MEMBRANES
Development of Reverse Osmosis Membrane for Seawater Desalination,
W80-04802 3A

MERCURY
The Effect of Lead, Cadmium, and Mercury on the Increase in Length of Five Intertidal Fucales,
W80-04910 5C

MESSINA (SICILY)
The Determination of Eddy Diffusion Coefficients Using Natural Tracers,
W80-04841 5B

METABOLISM
Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Load on Uptake of Glucose by Natural Planctonic Communities,
W80-04901 5B

A Study of Periphyton in a Polluted River (L'Agout) I. Structure and Development of Communities on Artificial Substrata. (In French),
W80-04908 5C

A Study of Periphyton in a Polluted River (L'Agout) II. Metabolism and Dynamics of Growth on Artificial Substrata, (In French),
W80-04909 5C

Short-Term Responses of Nutrient-Deficient Algae to Nutrient Addition,
W80-05022 5A

Chloride Uptake by Anacystis Nidulans (Cyanophyceae),
W80-05023 5C

Effect of Cysteine and Methionine on Sulfate Uptake and Primary Productivity by Axenic Cultures and Lake Microplankton Communities,
W80-05039 5C

METALLOTHIONEINS
Cadmium, Zinc and Copper Accumulation in Limpets (Patella Vulgata) from the Bristol Channel with Special Reference to Metallothioneins,
W80-04893 5B

METALS
Effects on Fish Exposed to Effluent from a Titanium Dioxide Industry and Tested with Rotatory-Flow Technique,
W80-04906 5A

METAMORPHIC ROCKS
Borehole Geophysics in Igneous and Metamorphic Rocks,
W80-04887 4B

METHEMOGLOBIN
Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--1. The Methemoglobin-Formation by the Nitroso-Derivatives in White-Spotted Char, Salvelinus Leucomaenis, Erythrocytes,
W80-04889 5B

Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--II. Production of Methemoglobin-Forming Metabolites of the Amino-Derivatives by White-Spotted Char, Salvelinus Leucomaenis, Liver Homogenate,
W80-04890 5B

METHOD OF LINES
Ground Water Flow Computations by Method of Lines,
W80-04950 7C

METHODOLOGY
The Acid-Base Balance in Lake Water,
W80-05016 2H

Lake Ecosystems: A Polyhedral Dynamics Representation,
W80-05040 5C

MEXICO
Use of the Waters of the Colorado River in Mexico: Pertinent Technical Commentaries,
W80-04985 6E

The Colorado River Salinity Agreement of 1973 and the Mexicali Valley,
W80-04986 6E

The Patrimonial Sea to the Rescue of the Gulf of California,
W80-04990 6E

Salinity Aspects of the Colorado River Agreement,
W80-05093 6E

MICHIGAN
Environmental Citizen Suits: Three Years' Experience Under the Michigan Environmental Protection Act,
W80-04967 6E

MILITARY ASPECTS
Transit Rights and U.S. Security Interests in International Straits: The 'Straits Debate' Revisited,
W80-04972 6E

MINING
Prospects for Deep Seabed Mining,
W80-04961 6E

A General International Law Doctrine for Seabed Regimes,
W80-04992 6E

MIXING
Vertical Mixing Induced by Wind and a Rotating Screen in a Stratified Fluid in a Channel,
W80-04837 2H

MODEL STUDIES
A Stochastic Model for Particle Sorting and Related Phenomena,
W80-04815 2J

Extension and Application of Feature Prediction Model for Synthesis of Hydrologic Records,
W80-04816 2E

Infiltration Under Rapidly Varying Surface Water Depths,
W80-04817 2G

Some Limitations of Water Quality Models for Large Lakes: A Case Study of Lake Ontario,
W80-04818 5B

Traveling Wave Solutions of Saturated-Unsaturated Flow Through Porous Media,
W80-04819 2G

Diffusion of a Passive Scalar with Random Advection,
W80-04821 5B

Intervention Analysis with Missing Data,

Multivariate Short-Term Rainfall Prediction,
W80-04824 2B

Percolation Theory and Models of Unsaturated Porous Media,
W80-04825 2G

On a Model of a Nonlinear Feedback System for River Flow Prediction,
W80-04828 2E

The Rotation of a Vertical Interface in a Porous Medium,
W80-04829 2F

A Non-Gaussian Markovian Model to Simulate Hydrologic Processes,
W80-04844 2E

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for Silver Creek, Clark and Floyd Counties, Indiana,
W80-04861 5B

Reliability of Cyclic Surface and Groundwater Storage Systems for Water Supply: A Preliminary Assessment,
W80-04878 6B

MONITORING
Discharge Data at Water-Quality Monitoring Stations in Arkansas, 1978 Water Year,
W80-04851 7A

Characterization of Organic Matter in Sediments from Gulf of Alaska, Bering and Beaufort Seas,
W80-05065 5B

MORROW CO. (OR)
A Preliminary Feasibility Study to Irrigate Western Umatilla and Northeastern Morrow Counties, Oregon.
W80-05017 6G

MUD MOUNTAIN RESERVOIR (WASH)
Sediment Transport by the White River Into Mud Mountain Reservoir, Washington, June 1974-June 1976,
W80-04857 2J

MUNICIPAL WASTEWATER
Application of Continuous Hydrologic Modeling to Evaluate and Design Wastewater Land Disposal or Evaporation Systems,
W80-04804 3C

MUNICIPAL WATER
Smyrna, Delaware Solves a Water Problem,
W80-04923 5F

Protecting Aquifers for the Future.
W80-04948 6F

MUSSELS
Concentration and Distribution of Uranium in Mytilus Edulis and Associated Materials,
W80-04895 5B

MUTAGENS
A Routine Water Monitoring Test for Mutagenic Compounds,
W80-04937 5A

MYTILUS
Concentration and Distribution of Uranium in Mytilus Edulis and Associated Materials,
W80-04895 5B

NASSAU COUNTY (NY)
Analysis of Ground Water by Different Laboratories -- A Comparison of Chloride and Nitrate Data, Nassau and Suffolk Counties, New York,
W80-04852 5A

NATURAL GAS
Distribution and Abundance of Low Molecular Weight Hydrocarbons and Suspended Hydrocarbons in Cook Inlet, Alaska,
W80-05062 5A

NATURAL STREAMS
Determination of Trace Elements in Natural Waters by the D.C. Argon Plasma, Multielement Atomic Emission Spectrometer (DCP-MAES) Technique,
W80-04858 7B

NEBRASKA
Regulation of Water Pollution from Agricultural Point Sources in Nebraska: Impact of the NPDES Permit Program on Feedlot Operations,
W80-04925 6E

NEREIS
Study of the Benthic Populations of Soft Substrates Off the Outfall of the Main Sewer of Marseille. 1. General Data on the Environment and Populations (In French),
W80-04888 5C

NETWORK DESIGN
Discharge Data at Water-Quality Monitoring Stations in Arkansas, 1978 Water Year,
W80-04851 7A

NEVADA
Water-Resources Data Collected in the Devils Hole Area, Nye County, Nevada 1976-77,
W80-04853 4B

NEW MEXICO
New Mexico's National Forests and the Implied Reservation Doctrine,
W80-04989 6E

Water Deliveries Under the Rio Grande Compact,
W80-05090 6E

NEW YORK
Oil Spills: A Coastal Resident's Handbook,
W80-04939 5C

NITRATES
The Selective Removal of Nitrate and Nitrite from Polluted Waters,
W80-04869 5F

The Response of Benthic Plants to Past Levels of Human Use in High Mountain Lakes in Kings Canyon National Park, California, U.S.A.,
W80-05036 5C

NITRIFICATION
Effect of Nitrification in Orta Lake,
W80-05026 5C

NITRITES
The Selective Removal of Nitrate and Nitrite from Polluted Waters,
W80-04869 5F

NITROGEN
Corn Response to Ammoniacal Nitrogen Under Varying Levels of Magnesium and Potassium Fertility,
W80-04871 3F

Agricultural Land Use: Effects on the Chemical Quality of Runoff,
W80-05012 5B

NITROGEN CYCLE
Effects of Hypolimnetic Aeration on Nitrogen Transformations in Simulated Lake Sediment-Water Systems,
W80-05031 5C

NORTH CAROLINA
The Coastal Area Management Act in the Courts: A Preliminary Analysis,
W80-04963 6E

Public Participation in Local Land-Use Planning: Concepts, Mechanisms, State Guidelines and the Coastal Area Management Act,
W80-05070 6E

NORTHWEST FLORIDA
Water Resources Data for Florida, Water Year 1978--Volume 4. Northwest Florida.
W80-04850 7C

NORTON RESERVOIR (MA)
Effects of Two Aroclor Fractions on the Productivity and Diversity of Algae from Two Lentic Ecosystems,
W80-05035 5C

NUCLEAR POWERPLANTS
Offshore Siting of Nuclear Power Plants,
W80-04942 5B

NUISANCE ALGAE
The Significance of Vitamins and the Epiphytic Bacterial Community in the Nutritional Ecology of Cladophora Glomerata,
W80-05008 5C

NUMERICAL ANALYSIS
Ground Water Flow Computations by Method of Lines,
W80-04950 7C

NUTRIENT REMOVAL
The Selective Removal of Nitrate and Nitrite from Polluted Waters,
W80-04869 5F

The Utilization of a Fresh-Water Wetland for Nutrient Removal from Secondarily Treated Waste Water Effluent,
W80-05033 5D

NUTRIENT REQUIREMENTS
Short-Term Responses of Nutrient-Deficient Algae to Nutrient Addition,
W80-05022 5A

NUTRIENT TRANSPORT
Chloride Uptake by Anacystis Nidulans (Cyanophyceae),
W80-05023 5C

NUTRIENTS
Phytoplankton and Environmental Conditions in Central and Coastal Areas of the Bothnian Bay,
W80-05020 5C

Nutrients Dynamics in Nearshore Alaskan Beaufort Sea Waters,
W80-05060 5C

OCEANS
A General International Law Doctrine for Seabed Regimes,
W80-04992 6E

United States Oceans Policy: Perspective 1974,
W80-05004 6E

OFFSHORE PLATFORMS
Offshore Siting of Nuclear Power Plants,
W80-04942 5B

OIL
Effects of Ingested Crude Oil on Black Guillemots: A Combined Field and Laboratory Study,
W80-04905 5C

Influence of Hydrocarbons on Ecology of Bacteria in Aerobic Lake Sediment, (In German),
W80-04913 5C

OIL INDUSTRY
Fishing and North Sea Oil,
W80-04941 5C

Law of the Sea: Its Impact on the International Energy Crisis,
W80-05002 6E

OIL POLLUTION
Sea Otter Distribution and Abundance Southern Kodiak Archipelago and the Semidi Islands,
W80-04946 5C

Belukha Whales in Lower Cook Inlet,
W80-04947 5C

Ecological Studies of Birds in the Northern Bering Sea: Seabirds at Bluff, Distribution of Birds at Sea, Movements of Birds in the Bering Strait,
W80-04951 5C

Sublethal Effects of Petroleum Hydrocarbons and Trace Metals, Including Biotransformations, as Reflected by Morphological, Chemical, Physiological, Pathological, and Behavioral Indices,
W80-04954 5C

Beaufort Sea Barrier Island-Lagoon Ecological Process Studies. Ecology of Invertebrates in Simpson Lagoon, Beaufort Sea, Alaska,
W80-04958 5C

Private Actions for Damages Resulting from Offshore Oil Pollution,
W80-04968 6E

A Comprehensive Oil Pollution Liability and Compensation Act: How Super is the 'Super Fund',
W80-04994 6E

Composition, Transport and Deposition of Suspended Matter in Lower Cook Inlet and Shelikof Strait, Alaska,
W80-05061 5C

State Control of Oil Pollution: Legislating in the Twilight Zone,
W80-05068 6E

Pollution: International Conventions, Federal and State Legislation,
W80-05072 6E

OIL SPILLS
Oil Spills: A Public Official's Handbook,
W80-04938 5C

Oil Spills: A Coastal Resident's Handbook,
W80-04939 5C

Private Actions for Damages Resulting from Offshore Oil Pollution,
W80-04968 6E

A Comprehensive Oil Pollution Liability and Compensation Act: How Super is the 'Super Fund',
W80-04994 6E

State Control of Oil Pollution: Legislating in the Twilight Zone,
W80-05068 6E

Federal Water Pollution Control Act - The Federal Government's Exclusive Remedy for Recoupment of Oil Spill Cleanup Costs,
W80-05073 6E

OIL WELLS
Differences Seen in Oil and Water Well Drilling,
W80-04945 8A

OKLAHOMA
Cultural Resource Survey and Testing at the Mcgee Creek Project, Oklahoma,
W80-04881 6B

ON-SITE MANAGEMENT DISTRICTS
Proceedings of a Workshop on Alternative Wastewater Treatment Systems at Urbana-Champaign, Illinois, June 12-13, 1979.
W80-04936 5D

ON-SITE TREATMENT SYSTEMS
Proceedings of a Workshop on Alternative Wastewater Treatment Systems at Urbana-Champaign, Illinois, June 12-13, 1979.
W80-04936 5D

OPTIMIZATION
The Application of Physical and Chemical Parameters to the Design of Raised Bed Soil Absorption Systems,
W80-04810 5D

OREGON
Estuarine Sanctuaries - The Oregon Experience,
W80-04922 6E

ORGANIC COMPOUNDS
Organic Solute-Mineral Surface Interactions: A New Method for the Determination of Groundwater Velocities,
W80-04827 7B

Micro-Organic Compounds in the Water Environment and Their Impact on the Quality of Potable Water Supplies,
W80-04883 5C

Effect of Cysteine and Methionine on Sulfate Uptake and Primary Productivity by Axenic Cultures and Lake Microplankton Communities,
W80-05039 5C

ORGANIC CONTAMINANTS
A Rational Approach to Utilization of Carbon Beds in Reducing Microorganic Contamination in Drinking Water,
W80-05013 5F

ORGANIC MATTER
Characterization of Organic Matter in Sediments from Gulf of Alaska, Bering and Beaufort Seas,
W80-05065 5B

ORGANOLEPTIC PROPERTIES
Micro-Organic Compounds in the Water Environment and Their Impact on the Quality of Potable Water Supplies,
W80-04883 5C

ORTA LAKE
Effect of Nitrification in Orta Lake,
W80-05026 5C

ORTHOPHOSPHATE
Phosphate-Limited Growth Kinetics of Selenastrum Capricornutum (Chlorophyceae),
W80-05024 5C

OTTERS
Sea Otter Distribution and Abundance Southern Kodiak Archipelago and the Semidi Islands,
W80-04946 5C

OUTER CONTINENTAL SHELF
Offshore Siting of Nuclear Power Plants,
W80-04942 5B

Sea Otter Distribution and Abundance Southern Kodiak Archipelago and the Semidi Islands,
W80-04946 5C

Belukha Whales in Lower Cook Inlet,
W80-04947 5C

Ecological Studies of Birds in the Northern Bering Sea: Seabirds at Bluff, Distribution of Birds at Sea, Movements of Birds in the Bering Strait,
W80-04951 5C

Sublethal Effects of Petroleum Hydrocarbons and Trace Metals, Including Biotransformations, as Reflected by Morphological, Chemical, Physiological, Pathological, and Behavioral Indices,

EPA Consolidation of Permits Proposal-Regulatory Workhorse or Bureaucratic Nightmare,
W80-05037 6E

PESTICIDE TOXICITY
Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--1. The Methemoglobin-Formation by the Nitroso-Derivatives in White-Spotted Char, Salvelinus Leucomaenis, Erythrocytes,
W80-04889 5B

Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--II. Production of Methemoglobin-Forming Metabolites of the Amino-Derivatives by White-Spotted Char, Salvelinus Leucomaenis, Liver Homogenate,
W80-04890 5B

PHAEOPHYTA
The Effect of Lead, Cadmium, and Mercury on the Increase in Length of Five Intertidal Fucales,
W80-04910 5C

PHOSPHATES
Phosphate-Limited Growth Kinetics of Selenastrum Capricornutum (Chlorophyceae),
W80-05024 5C

PHOSPHORUS
Nutrient Interactions and Algal Quality in Cayuga Lake,
W80-04801 5C

Techniques for Exploring and Presenting Data Applied to Lake Phosphorus Concentration,
W80-04843 7C

Agricultural Land Use: Effects on the Chemical Quality of Runoff,
W80-05012 5B

Phosphorus Loading From Urban Stormwater Runoff as a Factor in Lake Eutrophication: I. Theoretical Considerations and Qualitative Aspects,
W80-05029 5C

PHOTOSYNTHESIS
Light Independent Carbon Fixation by Marine Macroalgae,
W80-05021 5C

Short-Term Responses of Nutrient-Deficient Algae to Nutrient Addition,
W80-05022 5A

Chloride Uptake by Anacystis Nidulans (Cyanophyceae),
W80-05023 5C

PHYTOPLANKTON
Nutrient Interactions and Algal Quality in Cayuga Lake,
W80-04801 5C

Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Loads on Phytoplankton Communities,
W80-04904 5C

Freshwater Phytoplankton from the Narssaq Area, South Greenland,
W80-05018 2H

Phytoplankton and Environmental Conditions in Central and Coastal Areas of the Bothnian Bay,
W80-05020 5C

Cellulose Production by Planktonic Algae in Lacustrine Environments,
W80-05032 5C

Effect of Cysteine and Methionine on Sulfate Uptake and Primary Productivity by Axenic Cultures and Lake Microplankton Communities,
W80-05039 5C

PIERS
Theoretical Approach to Prediction of Local Scour Around Bridge Piers,
W80-04835 2J

PLANKTON
Melimex, an Experimental Heavy Metal Pollution Study: Behaviour of Heavy Metals in an Aquatic Food Chain,
W80-04900 5B

Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Load on Uptake of Glucose by Natural Planctonic Communities,
W80-04901 5B

PLANNING
Protecting Aquifers for the Future.
W80-04948 6F

Public Participation in Local Land-Use Planning: Concepts, Mechanisms, State Guidelines and the Coastal Area Management Act,
W80-05070 6E

PLANT DISEASE
Wastewater Recycling: Development of Plant Disease in an Old Field Ecosystem,
W80-04805 3C

PLASTIC PIPE
Using Nonmetallic Casing for Geothermal Wells,
W80-05063 8G

POINT BEACH (WIS)
High Frequency Temperature Fluctuations in a Power-Plant Thermal Plume,
W80-05009 5B

POLLUTANT IDENTIFICATION
Distribution and Abundance of Low Molecular Weight Hydrocarbons and Suspended Hydrocarbons in Cook Inlet, Alaska,
W80-05062 5A

POLLUTANTS
Diffusion of a Passive Scalar with Random Advection,
W80-04821 5B

Application of Enzyme Methods to the Determination of Pollutants in Water,
W80-04868 5A

POLLUTION ABATEMENT
Regulation of Water Pollution from Agricultural Point Sources in Nebraska: Impact of the NPDES Permit Program on Feedlot Operations,
W80-04925 6E

Black-Listing the Polluters,
W80-05067 6E

POLYCHLORINATED BIPHENYLS
Effects of Two Aroclor Fractions on the Productivity and Diversity of Algae from Two Lentic Ecosystems,
W80-05035 5C

POLYHEDRAL DYNAMICS
Lake Ecosystems: A Polyhedral Dynamics Representation,
W80-05040 5C

PONDS
Application of Continuous Hydrologic Modeling to Evaluate and Design Wastewater Land Disposal or Evaporation Systems,
W80-04804 3C

Wind-Driven Circulation in Small Shallow Lakes: Laboratory and Computational Experiments,
W80-04870 2H

POROUS MEDIA
Traveling Wave Solutions of Saturated-Unsaturated Flow Through Porous Media,
W80-04819 2G

Percolation Theory and Models of Unsaturated Porous Media,
W80-04825 2G

The Rotation of a Vertical Interface in a Porous Medium,
W80-04829 2F

PORT AUTHORITIES
Port Authorities View State Coastal Management Programs,
W80-05094 6E

POTABLE WATER
Micro-Organic Compounds in the Water Environment and Their Impact on the Quality of Potable Water Supplies,
W80-04883 5C

Health Considerations in the Preparation of Drinking Water from the River Rhine,
W80-04884 5C

Analysis of the Water Rate Structure as a Management Option for Water Conservation,
W80-05007 3D

A Rational Approach to Utilization of Carbon Beds in Reducing Microorganic Contamination in Drinking Water,
W80-05013 5F

PRECIPITATION (ATMOSPHERIC)
The Use of the Climatic Water Budget to Evaluate the Validity of a Precipitation Record,
W80-04877 7B

PREDATION
A Consideration of Trophic Dynamics in Some Tallgrass Prairie Farm Ponds,
W80-05025 5C

PRICING
Analysis of the Water Rate Structure as a Management Option for Water Conservation,
W80-05007 3D

PRIMARY PRODUCTIVITY
Phytoplankton and Environmental Conditions in Central and Coastal Areas of the Bothnian Bay,
W80-05020 5C

A Consideration of Trophic Dynamics in Some Tallgrass Prairie Farm Ponds,
W80-05025 5C

Effect of Cysteine and Methionine on Sulfate Uptake and Primary Productivity by Axenic Cultures and Lake Microplankton Communities,
W80-05039 5C

PRIOR APPROPRIATION
Dam Policy in Massachusetts,
W80-05014 6E

PRODUCTIVITY
Nutrients Dynamics in Nearshore Alaskan Beaufort Sea Waters,
W80-05060 5C

PROJECT PLANNING
Identifying the 'Public' for Participation in Coastal Zone Management,
W80-04927 6E

The Rainbow Bridge Case and Reclamation Projects in Reserved Areas,
W80-05092 6E

PROJECT POST-EVALUATION
Coastal Zone Management from an Administrative Perspective: A Case Study of the San Francisco Bay Conservation and Development Commission,
W80-04919 6E

PROJECTS
Wisconsin, a Summary of Activities and Plans of the United States Department of the Interior, Geological Survey, 1979.
W80-04859 7C

PUBLIC ACCESS
Managing Recreational Rivers,
W80-04935 6E

The Pressure for Shoreline Development: Spatial Concepts in Review,
W80-04991 6E

PUBLIC OFFICIALS
Oil Spills: A Public Official's Handbook,
W80-04938 5C

PUBLIC PARTICIPATION
Identifying and Meeting Training Needs for Public Participation Responsibilities in Water Resources Planning,
W80-05015 9B

PUBLIC RIGHTS
Laying the Foundation for Sophisticated Environmental Strategies: A Florida Case Study,
W80-04969 6E

Innovative Programs and Proposals for the Reconciliation of Private and Public Interests in the California Coastal Zone,
W80-04977 6E

California's Tidelands Trust for Modifiable Public Purposes,
W80-05069 6E

Public Participation in Local Land-Use Planning: Concepts, Mechanisms, State Guidelines and the Coastal Area Management Act,
W80-05070 6E

PUERTO RICO
Deep Excavation in Puerto Rico is Dewatered,
W80-04944 8B

PUMPING
Measurement, Prediction, and Hazard Evaluation of Earth Fissures and Subsidence, South-Central Arizona,
W80-05006 2F

PUMPS
Early Pressure Systems: The Water Ram,
W80-04952 8C

Submersible Pumps--Field Service,
W80-04953 8C

Design of a Cost Effective Solar Powered Water Pump,
W80-05011 8C

PUPFISH
Water-Resources Data Collected in the Devils Hole Area, Nye County, Nevada 1976-77,
W80-04853 4B

PYRANINE
Pyranine Used as a Fluorescent Tracer in Hydrology: PH Effects in Determination of Its Concentration,
W80-04846 7B

RAINBOW TROUT
Health Considerations in the Preparation of Drinking Water from the River Rhine,
W80-04884 5C

Accumulation and Biological Effects of Cadmium in Rainbow Trout,
W80-04896 5B

RAINFALL
Multivariate Short-Term Rainfall Prediction,
W80-04824 2B

RANGE MANAGEMENT
Management of Summer-Seasonal Irrigation Water in Beef Cow/Calf Agriculture in the Sierra Nevada Foothills,
W80-04803 3F

RAPIDS
The Effect of Dam Closure on Downstream Rapids,
W80-04820 2E

RECLAMATION
The Rainbow Bridge Case and Reclamation Projects in Reserved Areas,
W80-05092 6E

RECREATION FACILITIES
Managing Recreational Rivers,
W80-04935 6E

RECREATION WASTES
The Response of Benthic Plants to Past Levels of Human Use in High Mountain Lakes in Kings Canyon National Park, California, U.S.A.,
W80-05036 5C

RED CLOVER
Growth of Subterranean Clover in a Range Soil as Affected by Microclimate and Phosphorus Availability. III. Comparative Growth of Subterranean and Rose Clovers at Cold Soil Temperatures,
W80-04814 3F

RED TIDE
First Record of a Bloom of Gonyaulax Monilata in Coastal Waters of Mississippi,
W80-04892 5A

REGIONAL ANALYSIS
Regional Arrangements in the Oceans,
W80-05083 6E

New Nationwide Hydrologic Investigations.
W80-05099 6A

REGIONAL DEVELOPMENT
A 'Common Heritage' Approach to Fisheries Through Regional Controls,
W80-04960 6E

REGULATION
EPA Consolidation of Permits Proposal-Regulatory Workhorse or Bureaucratic Nightmare,
W80-05037 6E

REMEDIES
Federal Water Pollution Control Act - The Federal Government's Exclusive Remedy for Recoupment of Oil Spill Cleanup Costs,
W80-05073 6E

REPAIRING
An Eccentric Reducer Was the Answer,
W80-04965 8A

RESEARCH AND DEVELOPMENT
An Evaluation of Louisiana Superport Studies and Implications for Coastal Zone Management,
W80-04926 6E

Some Implication of Ocean Research,
W80-04975 6E

RESERVATION DOCTRINE
New Mexico's National Forests and the Implied Reservation Doctrine,
W80-04989 6E

Wrestling With Water Quantification in Western States,
W80-05091 6E

RESERVOIR SILTING
Simulation of Reservoir and Lake Sedimentation,
W80-05010 2J

RESERVOIR STORAGE
Reliability of Cyclic Surface and Groundwater Storage Systems for Water Supply: A Preliminary Assessment,
W80-04878 6B

RESERVOIRS
Sediment Transport by the White River Into Mud Mountain Reservoir, Washington, June 1974-June 1976,
W80-04857 2J

SOURCE ALLOCATION
United States Oceans Policy: Perspective 1974,
W80-05004 6E

Possible Solutions to the 200-Mile Territorial Limit,
W80-05087 6E

SOURCE ALLOCATIONS
Foreign Access to U.S. Fisheries in the Wake of the Fishery Conservation and Management Act,
W80-04970 6E

SOURCES DEVELOPMENT
Offshore Siting of Nuclear Power Plants,
W80-04942 5B

Beaufort Sea Barrier Island-Lagoon Ecological Process Studies. Oceanographic and Geologic Processes--A Synthesis of Ecologically Important Information,
W80-04959 5C

An Analysis of the Outer Continental Shelf Lands Act Amendments of 1978,
W80-04962 6E

Political Cobwebs Beneath the Sea,
W80-05085 6E

Marine Resources Committee (Annual Review of Activities - 1975).
W80-05086 6E

Possible Solutions to the 200-Mile Territorial Limit,
W80-05087 6E

Including Geothermal Resources Within the Mineral Estate: The Need for a Statutory Rule of Presumption,
W80-05088 6E

ESPIRATION
Short-Term Responses of Nutrient-Deficient Algae to Nutrient Addition,
W80-05022 5A

ETURN FLOW
Wastewater Recycling: Development of Plant Disease in an Old Field Ecosystem,
W80-04805 3C

Salty Waste Water--An Irrigation Source..
W80-04955 3C

EVERSE OSMOSIS
Development of Reverse Osmosis Membrane for Seawater Desalination,
W80-04802 3A

EVIEWS
Oscillator-Model Approach to the Identification and Assessment of Flow-Induced Vibrations in a System,
W80-04838 8B

HINE RIVER
Health Considerations in the Preparation of Drinking Water from the River Rhine,
W80-04884 5C

IO GRANDE COMPACT
Water Deliveries Under the Rio Grande Compact,
W80-05090 6E

IO GRANDE RIVER
Development of the Rio Grande Compact of 1938,
W80-04982 6E

IPARIAN RIGHTS
Dam Policy in Massachusetts,
W80-05014 6E

RIVER BASINS
Sediment Discharge in the Santa Clara River Basin, Ventura and Los Angeles Counties, California,
W80-04856 2J

RIVER FLOW
On a Model of a Nonlinear Feedback System for River Flow Prediction,
W80-04828 2E

RIVERS
Coastal Water Pollution Around Tiber River Mouth--A Case Study,
W80-04840 5B

Self-Purification of Rivers a Two-Phase Model for Bacterial Biodegradation,
W80-05028 5F

ROAD CONSTRUCTION
Suspended Sediment from Forest Road Construction,
W80-04808 4D

ROOTED AQUATIC PLANTS
The Uptake of Chemical Elements from Coal Ash and Settling Basin Effluent by Primary Producers I. Relative Concentrations in Predominant Plants,
W80-05038 5C

ROTARY DRILLING
Precision Drilling for Dam Safety.
W80-05055 8A

RUNOFF
A Non-Gaussian Markovian Model to Simulate Hydrologic Processes,
W80-04844 2E

The Use of the Climatic Water Budget to Evaluate the Validity of a Precipitation Record,
W80-04877 7B

RUNOFF FORECASTING
New Routing Model for Continuous Runoff Simulation,
W80-04831 2E

Finite Element Method for Direct Runoff Flow,
W80-04832 2E

RUNOFF SIMULATION
New Routing Model for Continuous Runoff Simulation,
W80-04831 2E

SALINITY
Use of the Waters of the Colorado River in Mexico: Pertinent Technical Commentaries,
W80-04985 6E

The Colorado River Salinity Agreement of 1973 and the Mexicali Valley,
W80-04986 6E

A Theoretical Analysis of Minute 242,
W80-04988 6E

Salinity Aspects of the Colorado River Agreement,
W80-05093 6E

SALVELINUS
Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--1. The Methemoglobin-Formation by the Nitroso-Derivatives in White-Spotted Char, Salvelinus Leucomaenis, Erythrocytes,
W80-04889 5B

Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--II. Production of Methemoglobin-Forming Metabolites of the Amino-Derivatives by White-Spotted Char, Salvelinus Leucomaenis, Liver Homogenate,
W80-04890 5B

SAMPLING
Development of a Self-Sealing Sampler for Ephemeral Wadi Floods,
W80-04830 7B

SANTA CLARA RIVER BASIN (CALIF)
Sediment Discharge in the Santa Clara River Basin, Ventura and Los Angeles Counties, California,
W80-04856 2J

SAUGER
Aquatic Studies of the Yellowstone River,
W80-04880 8I

SAVANNAH RIVER PROJECT (SC)
The Uptake of Chemical Elements from Coal Ash and Settling Basin Effluent by Primary Producers I. Relative Concentrations in Predominant Plants,
W80-05038 5C

SCALLOPS
Relationship Between the Body Size of Principal Shellfish and the Concentration of Few Heavy Metals (In Japanese),
W80-04894 5B

SCENEDESMUS
Short-Term Responses of Nutrient-Deficient Algae to Nutrient Addition,
W80-05022 5A

SCOLELEPIS
Study of the Benthic Populations of Soft Substrates Off the Outfall of the Main Sewer of Marseille. 1. General Data on the Environment and Populations (In French),
W80-04888 5C

SCOUR
Theoretical Approach to Prediction of Local Scour Around Bridge Piers,
W80-04835 2J

SEA WATER
Development of Reverse Osmosis Membrane for Seawater Desalination,
W80-04802 3A

SEASHORES
California's Tidelands Trust for Modifiable Public Purposes,
W80-05069 6E

SEASONAL
Seasonal Variation of Denitrification Rate in Sediment Determined by Use of N15,
W80-05027 5C

Seasonal Variation of Psychrotrophic Bacteria in Sediment From Lake Ontario,
W80-05030 5C

SEASONS
Population Dynamics and Trophic Relationships of Marine Birds in the Gulf of Alaska and Southern Bering Sea. Part 11: Notes on the Winter Seabirds of Chiniak Bay, Kodiak Island, Alaska,
W80-05050 5B

SEDIMENT CONTROL
Settleability of Urban Runoff Pollution,
W80-04807 5G

SEDIMENT DISCHARGE
Sediment Discharge in the Santa Clara River Basin, Ventura and Los Angeles Counties, California,
W80-04856 2J

SEDIMENT TRANSPORT
A Stochastic Model for Particle Sorting and Related Phenomena,
W80-04815 2J

Chemical and Sediment Mass Transfer in the Godavari River Basin in India,
W80-04845 2J

Sediment Transport by the White River Into Mud Mountain Reservoir, Washington, June 1974-June 1976,
W80-04857 2J

Simulation of Reservoir and Lake Sedimentation,
W80-05010 2J

SEDIMENT YIELD
Sediment Discharge in the Santa Clara River Basin, Ventura and Los Angeles Counties, California,
W80-04856 2J

SEDIMENTATION
Transport Processes of Particles in Non-Dilute Suspensions in Turbulent Water Flow- Phase I: Experimental Measurements,
W80-04866 8B

Notes on Sedimentation Activities Calendar Year 1978.
W80-04882 10C

Simulation of Reservoir and Lake Sedimentation,
W80-05010 2J

SEDIMENTS
Suspended Sediment from Forest Road Construction,
W80-04808 4D

A Stochastic Model for Particle Sorting and Related Phenomena,
W80-04815 2J

Chemical and Sediment Mass Transfer in the Godavari River Basin in India,
W80-04845 2J

Beaufort Sea Barrier Island-Lagoon Ecological Process Studies. Ecology of Invertebrates in Simpson Lagoon, Beaufort Sea, Alaska,
W80-04958 5C

Seasonal Variation of Psychrotrophic Bacteria in Sediment From Lake Ontario,
W80-05030 5C

Characterization of Organic Matter in Sediments from Gulf of Alaska, Bering and Beaufort Seas,
W80-05065 5B

Natural Distribution and Environmental Background of Trace Heavy Metals in Alaskan Shelf and Estuarine Areas,
W80-05066 5C

SELENASTRUM
Phosphate-Limited Growth Kinetics of Selenastrum Capricornutum (Chlorophyceae),
W80-05024 5C

SELF-PURIFICATION
Self-Purification of Rivers a Two-Phase Model for Bacterial Biodegradation,
W80-05028 5F

SEPTIC TANKS
The Application of Physical and Chemical Parameters to the Design of Raised Bed Soil Absorption Systems,
W80-04810 5D

SERVICING
Submersible Pumps--Field Service,
W80-04953 8C

SETTLEABILITY OF POLLUTANTS
Settleability of Urban Runoff Pollution,
W80-04807 5G

SETTLING BASINS
Settleability of Urban Runoff Pollution,
W80-04807 5G

SEWAGE
The Determination of Eddy Diffusion Coefficients Using Natural Tracers,
W80-04841 5B

SEWAGE DISPOSAL
Deep Well Injection for Florida Effluent.
W80-04984 5B

SEWAGE EFFLUENTS
Application of Enzyme Methods to the Determination of Pollutants in Water,
W80-04868 5A

Study of the Benthic Populations of Soft Substrates Off the Outfall of the Main Sewer of Marseille. 1. General Data on the Environment and Populations (In French),
W80-04888 5C

SEWAGE TREATMENT
The Application of Physical and Chemical Parameters to the Design of Raised Bed Soil Absorption Systems,
W80-04810 5D

SEWERS
Surcharge of Sewer Systems,
W80-04867 8B

SHORE BIRDS
Ecological Studies of Birds in the Northern Bering Sea: Seabirds at Bluff, Distribution of Birds at Sea, Movements of Birds in the Bering Strait,
W80-04951 5C

SHORE PROTECTION
Efficiency Impacts of Cost Sharing on Shoreline Management,
W80-04917 6E

Federal Consistency and State Expectations,
W80-04918 6E

Coastal Zone Management from an Administrative Perspective: A Case Study of the San Francisco Bay Conservation and Development Commission,

W80-04848 7C

Water Resources Data for Florida, Water Year 1978--Volume 4. Northwest Florida.
W80-04850 7C

Determination of Trace Elements in Natural Waters by the D.C. Argon Plasma, Multielement Atomic Emission Spectrometer (DCP-MAES) Technique,
W80-04858 7B

A Routine Water Monitoring Test for Mutagenic Compounds,
W80-04937 5A

SURVEYS
Knik Glacier, Alaska, May 1979 Monument and Glacier Survey,
W80-04863 7C

Cultural Resource Survey and Testing at the Mcgee Creek Project, Oklahoma,
W80-04881 6B

Freshwater Phytoplankton from the Narssaq Area, South Greenland,
W80-05018 2H

SUSPENDED LOAD
Suspended Sediment from Forest Road Construction,
W80-04808 4D

SUSPENDED SOLIDS
Composition, Transport and Deposition of Suspended Matter in Lower Cook Inlet and Shelikof Strait, Alaska,
W80-05061 5C

SYNTHETIC HYDROLOGY
Extension and Application of Feature Prediction Model for Synthesis of Hydrologic Records,
W80-04816 2E

A Non-Gaussian Markovian Model to Simulate Hydrologic Processes,
W80-04844 2E

TAPWATER
Wastewater Recycling: Development of Plant Disease in an Old Field Ecosystem,
W80-04805 3C

TECHNOLOGY
Differences Seen in Oil and Water Well Drilling,
W80-04945 8A

THEORETICAL ANALYSIS
Percolation Theory and Models of Unsaturated Porous Media,
W80-04825 2G

Theoretical Approach to Prediction of Local Scour Around Bridge Piers,
W80-04835 2J

THERMAL PLUME
High Frequency Temperature Fluctuations in a Power-Plant Thermal Plume,
W80-05009 5B

THERMAL POLLUTION
High Frequency Temperature Fluctuations in a Power-Plant Thermal Plume,
W80-05009 5B

THERMAL POWERPLANTS
High Frequency Temperature Fluctuations in a Power-Plant Thermal Plume,
W80-05009 5B

TIBER RIVER (ITALY)
Coastal Water Pollution Around Tiber River Mouth--A Case Study,
W80-04840 5B

TIDAL WATERS
Dispersion in Two-Layer Stratified Water Bodies,
W80-04833 2L

TIDELANDS
California's Tidelands Trust for Modifiable Public Purposes,
W80-05069 6E

TIME SERIES ANALYSIS
Intervention Analysis with Missing Data,
W80-04823 7C

TISSUE ANALYSIS
Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--1. The Methemoglobin-Formation by the Nitroso-Derivatives in White-Spotted Char, Salvelinus Leucomaenis, Erythrocytes,
W80-04889 5B

Studies on Toxicities of Biphenyl Ether Herbicides and Their Analogues to Fish--II. Production of Methemoglobin-Forming Metabolites of the Amino-Derivatives by White-Spotted Char, Salvelinus Leucomaenis, Liver Homogenate,
W80-04890 5B

Cadmium, Zinc and Copper Accumulation in Limpets (Patella Vulgata) from the Bristol Channel with Special Reference to Metallothioneins,
W80-04893 5B

Relationship Between the Body Size of Principal Shellfish and the Concentration of Few Heavy Metals (In Japanese),
W80-04894 5B

Concentration and Distribution of Uranium in Mytilus Edulis and Associated Materials,
W80-04895 5B

Accumulation and Biological Effects of Cadmium in Rainbow Trout,
W80-04896 5B

Influence of Copper and Zinc in Food Substance on the Accumulation of Cultured Oysters (In Japanese),
W80-04897 5B

Melimex, an Experimental Heavy Metal Pollution Study: Behaviour of Heavy Metals in an Aquatic Food Chain,
W80-04900 5B

Effects of Ingested Crude Oil on Black Guillemots: A Combined Field and Laboratory Study,
W80-04905 5C

TITANIUM
Effects on Fish Exposed to Effluent from a Titanium Dioxide Industry and Tested with Rotatory-Flow Technique,
W80-04906 5A

TOXICITY
Study of the Benthic Populations of Soft Substrates Off the Outfall of the Main Sewer of Marseille. 1. General Data on the Environment and Populations (In French),
W80-04888 5C

Degree of Dispersion of the Zaco Temmincki School to Water Quality in a Streaming Water Trough (In Japanese),
W80-04898 5C

Melimex, an Experimental Heavy Metal Pollution Study: Oligochaetes and Chironomid Larvae in Heavy Metal Loaded and Control Limno-Corrals,
W80-04902 5B

Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Load on Crustacea Plankton,
W80-04903 5C

Melimex, an Experimental Heavy Metal Pollution Study: Effects of Increased Heavy Metal Loads on Phytoplankton Communities,
W80-04904 5C

Effects of Ingested Crude Oil on Black Guillemots: A Combined Field and Laboratory Study,
W80-04905 5C

Effects on Fish Exposed to Effluent from a Titanium Dioxide Industry and Tested with Rotatory-Flow Technique,
W80-04906 5A

Influence of Copper Sulphate on the Structure of the Net of Larvae of Hydropsyche (Insecta, Trichoptera), (In French),
W80-04911 5C

Influence of Hydrocarbons on Ecology of Bacteria in Aerobic Lake Sediment, (In German),
W80-04913 5C

Speciation and Rate of Loss of Copper from Lakewater with Implications to Toxicity,
W80-05034 5C

Distribution and Abundance of Low Molecular Weight Hydrocarbons and Suspended Hydrocarbons in Cook Inlet, Alaska,
W80-05062 5A

TRACE ELEMENTS
Determination of Trace Elements in Natural Waters by the D.C. Argon Plasma, Multielement Atomic Emission Spectrometer (DCP-MAES) Technique,
W80-04858 7B

TRACERS
Organic Solute-Mineral Surface Interactions: A New Method for the Determination of Groundwater Velocities,
W80-04827 7B

Pyranine Used as a Fluorescent Tracer in Hydrology: PH Effects in Determination of Its Concentration,
W80-04846 7B

Seasonal Variation of Denitrification Rate in Sediment Determined by Use of N15,
W80-05027 5C

TRAINING
Identifying and Meeting Training Needs for Public Participation Responsibilities in Water Resources Planning,
W80-05015 9B

TRANSPORTATION
Coal Slurry Transportation Systems and Related Water Rights and Water Quality Problems,
W80-04979 6E

TRANSURANIC ELEMENTS
Concentration and Distribution of Uranium in Mytilus Edulis and Associated Materials,
W80-04895 5B

TREATIES
The International Regime for the Deep Seabed: Past Conflicts and Proposals for Progress,
W80-05074 6E

Political Cobwebs Beneath the Sea,

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 13, NUMBER 16
AUGUST 15, 1980

W80-05101 -- W80-05400
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of tne Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the
Office of Water Research and Technology
U.S. Department of the Interior

VOLUME 13, NUMBER 16
AUGUST 15, 1980

W80-05101 -- W80-05400

The Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most our our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographic citation and a set of identifiers or descriptors which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Office of Water Research and Technology.

To provide SWRA with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

The input from these Centers, and from the 54 Water Resources Research Institutes administered under the Water Research and Development Act of 1978, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies becomes the information base from which this journal is derived.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

CONCENTRATION AND FRACTIONATION OF HYDROPHOBIC ORGANIC ACID CONSTITUENTS FROM NATURAL WATERS BY LIQUID CHROMATOGRAPHY,
Geological Survey, Lakewood, CO. Water Resources Div.
E. M. Thurman, and R. L. Malcolm.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $1.25. Geological Survey Water-Supply Paper 1817-G, 1979. 16 p, 4 Fig, 2 Tab, 13 Ref.

Descriptors: *Distillation, *Organic acids, *Chromatology, *Adsorption, *Analytical techniques, Water properties, Instrumentation, Methodology, Separation techniques, Gels, Hydrogen ion concentration, Fulvic acids, Phenols, Humic acids, Conductivity, *Liquid chromatography, Hydrophobic organic acids.

A scheme is presented which uses adsorption chromatography with pH gradient elution and size-exclusion chromatography to concentrate and separate hydrophobic organic acids from water. A review of chromatographic processes involved in the flow scheme is also presented. Organic analytes that appear in each aqueous fraction are quantified by dissolved organic carbon analysis. Hydrophobic organic acids in a water sample are concentrated on a porous acrylic resin. These acids usually constitute approximately 30 to 50 percent of the dissolved organic carbon in an unpolluted water sample and are eluted with an aqueous eluent (dilute base). The concentrate is then passed through a column of polyacryloylmorpholine gel, which separates the acids into high- and low-molecular-weight fractions. The high- and low-molecular-weight eluates are reconcentrated by adsorption chromatography, then are eluted with a pH gradient into strong acids (predominately carboxylic, acids) and weak acids (predominately phenolic compounds). For standard compounds and samples of unpolluted waters, the scheme fractionate humic substances into strong and weak acid fractions that are separated from the low molecular weight acids present. A new method utilizing conductivity is also presented to estimate the acidic components in the methanol fraction. (Kosco-USGS)

VERIFICATION OF MATHEMATICAL AND PHYSICAL MODELS IN HYDRAULIC ENGINEERING.
Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978. American Society of Civil Engineers, New York, 1978. 887 p.

Descriptors: *Conferences, *Hydraulics, *Mathematical models, *Hydraulic models, *Model studies, *Statistical models, Hydraulic engineering, Groundwater, Open channel flow, Calibrations, Groundwater movement, Roughness(Hydraulic), Natural streams, Aquifers, Porous media, Open channels, Water management(Applied), Navigation, Land use, Estuaries, Tidal waters, Hydraulic structures, Lakes, Rivers, Watersheds(Basins), Runoff, Analytical techniques, Analysis, Numerical analysis, Unsteady flow, Sediment transport, Thermal plumes.

The purpose of this conference was to focus attention on verification of mathematical and physical models in hydraulic engineering. Subject areas covered by the 96 papers included: societal obligations of a people-serving profession, current practices and data basis for the verification of effluent models, flow model calibration, groundwater model calibrations or parameter identification, modeling for water quality management, models for navigation project planning, application of groundwater models to actual field situations, modeling of tidal and estuarine circulation and water quality problems, computational hydraulics, water quality analysis, modeling of prototype testing of submerged hydraulic structures in a lake regime, prototype verification of models for hydraulic structures, tidal hydraulics, unsteady flow, sediment models, hydrologic models, and land use models. APPLICATION OF COSSARR MODEL IN CENTRAL JAVA,
Engineering Consultants, Inc., Denver, CO.
Y. Au-Yeung, J. Loebis, and S. Komarawinata.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 715-722, 1978. 3 Fig, 7 Tab, 2 Ref.

Descriptors: *Model studies, *Watersheds(Basins), *Hydrologic systems, *Synthetic hydrology, Streamflow, Hydrology, Computer models, Runoff, Soil moisture, Evapotranspiration, Base flow, Infiltration, *Java, Model calibration.

The watershed model portion of the COSSARR model provided a useful tool in streamflow extension for three river basins in central Java. The successful use of the model, like all other hydrologic models, is determined largely by the quantity and quality of the available data as demonstrated by the difference in the computed runoff volumes from using only four years of mean daily flow data as compared with six years of actual flow data in the Lukulo watershed. Without a reasonable lenght of concurrent observed streamflow data and observed rainfall data, the accuracy of the model verification is difficult and uncertain. Another difficulty involved in applying the model was in the filling and adjusting the missing rainfall data for period when localized thunderstorms produce most of the rainfall. Four years of observed hydrologic data is too short a period to adequately verify the runoff-rainfall relationship of any watershed, therefore, it was planned to recalibrate the model in 1980. One hopes there will be at least ten years of observed hydrologic data for better model calibration. (See also W80-05159) (Humphreys-ISWS)
W80-05226

UPPER ST. JOHNS RIVER BASIN WATER MANAGEMENT MODEL,
St. Johns River Water Management District, Palatka, FL. Engineering Div.
C. C. Tai.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 729-736, 1978. 4 Fig, 4 Ref.

Descriptors: *Water management(Applied), *Florida, *Model studies, *River basins, Hydrologic systems, Watersheds(Basins), Runoff, Water balance, Management, Hydrograph analysis, Base flow, Rainfall, Evapotranspiration, Computer models, Soil water, Surface runoff, Infiltration, Analytical techniques, *St. Johns River(FL).

The Upper St. Johns River Basin covers a drainage area of about 2,000 square miles in east central Florida within the boundary of the St. Johns River Water Management District. The main river channel runs northerly with an average hydraulic gradient of 0.16 feet per mile for about 95 miles from the headwater near Melbourne. The Upper St. Johns Basin Model (USJM) has been developed with special consideration given to the extraordinary hydrologic features of the basin. The model was organized so that the hydrologic responses resulting from any change in each element of the project works could be generated. The USJM consists of two major components, namely the USJ runoff model and the USJ routing model. The runoff model generates the runoff hydrograph for each discrete land area from input rainfall data. The routing model modifies this hydrograph by considering the impoundment and transient lag time effects to produce an inflow hydrograph into the main river, and finally computes the discharge hydrograph for each river reach. The valley flow will be simulated with partial differential equations written for overland flow over a grid mesh. The model has been used to simulate two planning units and has produced favorable results. The actual simulation run of the entire Upper St. Johns River Basin has not been performed because the total required data is not yet available. (See also W80-05159) (Humphreys-ISWS)
W80-05227

THE EFFECT OF PRECIPITATION PATTERNS ON SURFACE RUNOFF,
California State Dept. of Water Resources, Sacramento.
R. H. Zettlemoyer.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 776-782, 1978. 4 Fig, 4 Ref.

Descriptors: *Precipitation(Atmospheric), *Distribution patterns, *Model studies, *Surface runoff, *California, Hydrology, Runoff, Annual, Analysis, Simulation analysis, River basins, Evaporation, Watersheds(Basins), *Mattole River(CA).

A general hydrologic model was used to evaluate the effect on annual runoff due to variations in precipitation throughout the year. The Mattole River basin in a humid region of California was calibrated to a 15-year period, and then annual rainfall totals were made equal to the minimum, median, and maximum annual totals of the calibration period. The simulation showed that favorable patterns could produce up to 10% greater runoff than an average year, and conversely unfavorable patterns could produce 10% less runoff than a typical year for the Mattole basin. Caution is recommended in extrapolating to other hydrologically different areas. Model studies as described can be useful when verifying water supply forecasts. Another application includes the preparation of water supply forecasts that are based on long-range weather forecasts which contain only trend type

precipitation information. (See also W80-05159) (Humphreys-ISWS)
W80-05233

LINEARIZED SUBHYDROGRAPHS URBAN RUNOFF MODEL,
Akron Univ., OH. Dept. of Civil Engineering.
S. Sarikelle, J-S. Chien, and G. L. French.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 783-790, 1978. 6 Fig, 6 Ref.

Descriptors: *Model studies, *Urban runoff, *Hydrograph analysis, *Cities, Mathematical models, Analytical techniques, Analysis, Runoff, Urban hydrology, Hyetographs, Methodology, Runoff coefficient, Watersheds(Basins), Rainfall-runoff relationships, Simulation analysis, Storm water, Linearized subhydrographs method.

A model for the simulation of urban runoff based on the Linearized Subhydrographs Method was verified for the planning and analysis of converging stormwater drainage systems in urban areas. The model simulates hydrographs for continuously recorded rainstorm events as applied to different watersheds of various sizes. The model was applied to various urban watersheds with differing land use characteristics utilizing recorded hyetographs. The simulated hydrographs were then compared to recorded hydrographs. The results indicate that when continuous event hyetographs are utilized, the simulated hydrographs compare well to those results obtained from measured values. (See also W80-05159) (Humphreys-ISWS)
W80-05234

ASSESSING LAND USE CHANGES WITH AN URBAN RUNOFF MODEL,
North Virginia Planning District Commission, Falls Church.
H. A. Bonuccelli, and J. P. Hartigan.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 827-835, 1978. 3 Fig, 9 Ref, 1 Append.

Descriptors: *Urban runoff, *Land use, *Model studies, *Effects, Cities, Watersheds(Basins), Management, Hydrographs, Planning, Hydrologic aspects, Environment, Decision making.

The dissemination of reports on successful applications of urban runoff simulation models in 'real-world' settings can be expected to bring about more widespread adoption of computer modeling techniques by the public sector. This paper provided such a case study. It described a regional stormwater management program that has successfully incorporated computer modeling techniques into local decision-making processes. The use of a verified model as an ongoing planning tool in the Four Mile Run Watershed Management Program has yielded many important benefits. It has allowed public works officials in four political subdivisions to view the watershed as an integrated system and has eliminated the traditional 'piecemeal' approach to drainage improvements in the watershed. By addressing complex hydraulic interactions in the watershed, it has enabled the local jurisdictions to determine the downstream impacts of developments throughout the basin. It revealed the importance of a single tributary as a hydraulic control for the flood control channel and indicated that certain parts of the watershed are more sensitive to land use change than others. By demonstrating the inappropriateness of uniform detention ordinances in the basin, it has prevented the expenditure of funds on needless or harmful control measures. (See also W80-05159) (Humphreys-ISWS)

RUNOFF SIMULATION MODEL: APPLICATION AND VERIFICATION,
Weston (Roy F.), Inc., West Chester, PA.
D. F. Lakatos, and K. C. Wiswall.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 836-843, 1978. 4 Fig, 1 Tab, 2 Ref.

Descriptors: *Runoff, *Model studies, *Urban runoff, *Maryland, Storm runoff, Urban drainage, Flooding, Watersheds(Basins), Peak discharge, Analytical techniques, Drainage systems, Storm water, Management, *Aberdeen(MD), Penn State Runoff Model.

The initial phase of the Aberdeen, Maryland, study was a thorough investigation of the existing drainage system to provide a full description of the physical characteristics of the system. These physical characteristics are needed for accurate development of the required input for the Penn State Runoff Model. The modeling technique consisted of the following six steps: (1) Collect and analyze existing drainage system information. (2) Select the design storms and the storms needed for calibration/verification. (3) Make calibration/verification runs to determine the accuracy of model coefficients. (4) Model the existing system to pinpoint the critical flooding areas. (5) Input the alternative runoff control techniques for further model analysis. (6) Recommend a set of runoff control techniques based on modeling results and on overall costs. The case study application of this model illustrated its practicality in developing realistic control alternatives for stormwater management. The Town of Aberdeen has begun to correct those components of the two storm drainage systems that were determined to be critical enough to require short-term action. In addition, potential funding sources are being investigated in order that the required overall or long-term system-control recommendation can be implemented. (See also W80-05159) (Humphreys-ISWS)

In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 844-853, 1978. 4 Tab, 6 Ref.

Descriptors: *Water management(Applied), *Decision making, *Detention reservoirs, *Water policy, Storm water, Management, Model studies, Storm runoff, Mathematical models, Watersheds(Basins), Hydrology, Flood routing, Storage, Sediment discharge, Urban runoff, Stormwater detention.

A mathematical model was formulated to simulate the response of a detention basin to flow and sediment discharges. The model was calibrated using data obtained from an existing detention basin on a 47-acre watershed in Montgomery County, Maryland. The model was then used to evaluate the response of the detention basin for storms of various intensities and durations and for two land use conditions: a highly pervious, exposed soil condition, and a semipervious, exposed soil condition. Various detention basin design policies were evaluated and the effects of changes in detention basin parameters on detention basin design policies were evaluated. The use of the model resulted in several important conclusions. First, inflow volume has a significant effect on both peak discharge reduction and sediment trap efficiency. Second, hydrologic designs have traditionally been based on both a duration and a frequency. Third, the use of one return period as the basis for a detention basin design policy does not lead to a design that reflects the intent of stormwater management. Fourth, current design policies often establish the required basin storage volume independent of the design characteristics of the riser and outflow pipe. Fifth, sediment trap efficiency was dependent on the volume of inflow sediment and the volume of basin storage. In summary, detention storage is an effective means for controlling the effects on runoff of continued urban expansion. But for detention storage to provide optimum protection and to meet the intent of stormwater management policies, the design policies need to be more comprehensive than most existing policies. WATER IN THE PENSACOLA, FLORIDA, AREA.
Geological Survey, Tallahassee, FL. Water Resources Div.
Geological Survey Water-Resources Investigations 79-89 (open-file report), 1979. 16 p, 8 Ref.

Descriptors: *Groundwater resources, *Surface waters, *Florida, *Water quality, *Available water, Freshwater, Rainfall-runoff relationships, Streamflow, Hydrologic budget, Aquifers, Water supply, Water utilization, Industrial wastes, Waste disposal, Cooling, Water resources development, Saline water intrusion, Water pollution, Flooding, Gulf Coastal Plain, *Pensacola area(Fla), Floridan aquifer.

The Pensacola, Florida, area, comprising Escambia and Santa Rosa Counties, has abundant water of good quality. Most of the freshwater used, about 101 million gallons per day, comes from the surficial sand-and-gravel aquifer. The deeper Floridan aquifer locally contains saltwater, and is used in places for industrial waste disposal. Surface water is used for cooling and waste disposal, but is available for additional development. Water problems around Pensacola are localized, but they include saltwater encroachment, contamination of ground water by industrial wastes, high iron concentration, corrosiveness, and nitrate in ground water, and flooding. These problems point up the need for continued monitoring of the water resource. (Kosco-USGS)

2B. Precipitation

COMPARISON OF GENERALIZED ESTIMATES OF PROBABLE MAXIMUM PRECIPITATION WITH GREATEST OBSERVED RAINFALLS,
National Weather Service, Silver Spring, MD.
J. T. Riedel, and L. C. Schreiner.
NOAA Technical Report NWS 25, March 1980. 70 p, 40 Fig, 5 Tab, 15 Ref.

Descriptors: *Probable maximum precipitation, *Precipitation(Atmospheric), *Rainfall, *Storms, *Meteorology, Appalachian mountain region, Gulf of Mexico, Snake River, California, North Dakota, Regional analysis, United States.

The relationship between probable maximum precipitation (PMP) estimates and observed maximum rainfalls was investigated for two regions of the U.S., east of the 105th meridian and west of the Continental Divide. Storms used in the study were those of record having point or area rainfall depths that are greater than or equal to 50% of PMP. In the East, 177 storms were identified that met this criterion and rainfall amounts were well distributed over the range of durations and area sizes. Approximately 1% of the Eastern storms were within 20% of PMP. A smaller storm sample was

obtained in the West, and detailed comparisons analogous to those in the East cannot be made. Despite this smaller Western storm sample, there were more cases in the West of greater than or equal to 50% of PMP for 10 sq mi areas (6 and 24 hours) than in the East. A rough comparability in PMP between the East and West was observed in comparisons of PMP values with the values for the 100 yr occurrence. These ratios were low in areas of frequent heavy rains such as the Cascade-Sierra slopes, the Appalachians, and the Gulf of Mexico coastal regions. Conversely these ratios were high in areas where heavy rains are uncommon such as the central valley of California, the Snake River and North Dakota. (Seigler-IPA)

STOCHASTIC ANALYSIS OF ANNUAL RAINFALL AFFECTED BY URBANIZATION,
Purdue Univ., Lafayette, IN. School of Civil Engineering.
A. R. Rao.
Journal of Applied Meteorology, Vol 19, No 1, p 41-52, January 1980. 5 Fig, 3 Tab, 7 Ref. OWRT-B-025-IND(6).

Descriptors: *Rainfall, *Stochastic processes, *Urbanization, Microclimatology, Urban hydrology, Precipitation(Atmospheric), Seasonal, Model studies, Cities, *Annual rainfall, *Stochastic analysis, Microclimate, Seasonality, Random variables, Integrated moving average, Standard error, Urban precipitation.

Investigators have shown that changes in microclimate were caused by large urban areas. Precipitation-related activity has been shown to be larger in and around urban areas than in the surrounding countryside. Seasonality of increased precipitation also has been investigated. This paper dealt with testing the significance of observed changes in the mean and in the trends of annual precipitation series of data from St. Louis, Missouri, and LaPorte, Indiana, and nearby stations. The annual rainfall series at LaPorte and St. Louis were found to be correlated. Thus, the traditional univariate and multivariate tests which were based on the assumption that the variates were independent random variables was not applicable to testing changes in the characteristics of annual precipitation data. Integrated moving average models of the annual precipitation data were used. The statistical significance of the observed changes in urban precipitation data was discussed, and a set of conclusions was presented. (Roberts-ISWS)

EMPIRICALLY DERIVED PROBABILITY ESTIMATES OF DROUGHT PARAMETERS FOR WESTERN UNITED STATES BACK TO 1700 A.D.,
M. P. Lawson, and D. Embry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-190630, Price codes: A06 in paper copy, A01 in microfiche. Nebraska Water Resources Center, University of Nebraska, Lincoln Project Completion Report, September 30, 1979. 99 p, 28 Fig, 6 Tab, 32 Ref, 1 Append. OWRT A-055-NEB(1).

Descriptors: *Droughts, *Probability, *Stochastic processes, *Water shortage, Precipitation(Atmospheric), Weather patterns, Mathematical models, Model studies, Dendrochronology, Dating, History, Statistical methods, Climatic data, Climatology.

The runs method of analysis, a succession of similar events preceded and succeeded by different events, was used to compare theoretical probability drought models on a regional basis with presecular time series data. Data used dated back to 1700 A.D. and came from reconstructed moisture indices, Palmer Drought Severity Indices (P.D.S.I.), computed from tree-ring indices. Parameters used in computing P.D.S.I. include evapotranspiration, recharge, runoff, moisture loss, and precipitation. The P.D.S.I. can indicate drought severity, run-sum, as well as duration, run-length. Results for the 263 year period studied show droughts ranging from 4 to 11 continuous years. Major droughts of four or more years occurred during the periods of 1710-1720, 1720-1780, 1830-1870, the 1880's, and the 1930's. Maximum drought intensities ranged from a -6.825 to a -41.643 sum of negative P.D.S.I. values for droughts of 4 to 11 years. Maximum drought intensities were compared to their durations to compute ratios of average water deficiency. These regional ratios ranged from nearly 4:1 to less than 2:1. It appears that droughts in the Western U.S. begin with a slow deficit growing to a maximum deficit followed by a slow recovery. For a 200 year period the probability of maximum drought recurrence ranged from 1 to 83% with maximum intensity ranging from 1 to 10%. (Seigler-IPA)

Descriptors: *Urbanization, *Rainfall disposition, *Distribution patterns, *Weather modification, Rainfall, Local precipitation, Stochastic processes, LaPorte(IN), St. Louis(MO).

Several investigators have pointed out the changes in microclimate brought about by large urban areas. The paper deals with testing the significance of observed changes in the mean and the trends of the annual precipitation series from St. Louis, Missouri and LaPorte, Indiana and other stations in the vicinity of these stations. The annual precipitation data may not be assumed to be independent random variables because they may be correlated. For example, the annual rainfall series at LaPorte and St. Louis were found to be correlated. Consequently, the traditional univariate and multivariate tests which are based in the assumption that the variates are independent random variables may not be applicable to testing changes in the characteristics of annual precipitation data. As a result, Integrated Moving Average (IMA) models of the annual precipitation data are used in the study. The posterior distributions of the parameters of the IMA models were obtained by assuming locally uniform and independent prior distributions of the parameters. Significance tests based on these posterior distributions are used to determine the statistical significance of the observed changes in precipitation which are attributed to the effects of urbanization. The importance of model validation tests and their relationship to the inference are demonstrated by considering the IMA models of different orders. (Wiersma-Indiana)

2C. Snow, Ice, and Frost

RECONNAISSANCE SNOW SURVEYS OF THE NATIONAL PETROLEUM RESERVE IN ALASKA, APRIL 1977 AND APRIL-MAY 1978,
Geological Survey, Anchorage, AK. Water Resources Div.
C. Sloan, D. Trabant, and W. Glude.
Available from: OFSS, Box 25425, Fed Ctr, Denver CO 80225. Price codes: $5.25 in paper copy, $3.50 in microfiche. Geological Survey open-file report 79-1342 (WRI), 1979. 31 p, 15 Fig, 3 Tab, 3 Ref.

Descriptors: *Snow surveys, *Evaluation, *Alaska, *Snow management, Sampling, Snowfall, Snow cover, Water equivalent, Snowpacks, Temperature, Remote sensing, *National Petroleum Reserve in Alaska.

Reconnaissance snow surveys of the NPRA (National Petroleum Reserve in Alaska) were made in April 1977 and April-May 1978 to ascertain general snow characteristics and distribution patterns. Thirty-nine sites in 1977 and forty-one sites in 1978 were sampled to determine snow depth, density, structure, and snow-soil interface temperature. In addition, snow surface wind indicators were examined over most of NPRA. In April and early May of two consecutive years, the snow cover in NPRA was thin, wind-packed, and virtually continuous. The depth and water equivalent of the snow generally increased with altitude and with distance from the coastal plain. Snow depth on tundra ranged from less than 0.20 m (meters) near the coast to more than 0.90 m in parts of the Brooks Range. Snow density was relatively high in areas where wind slab was developed throughout the snowpack, and lower where there was less wind slab. In 1977, the coastal plain showed the greatest wind slab development and higher densities, averaging 310 kg/cu m (kilograms per cubic meter) on tundra, while the mountains and foothills had less wind slab and lower densities, averaging 270 kg/cu m. In 1978, with more local variation, snow density on the coastal plain averaged 330 kg/cu m on tundra and averaged 310 kg/cu m in the mountains and foothills. Water equivalent of the snowpack in 1977 ranged from less than 0.10 m in the coastal areas to more than 0.25 m in the Brooks Range, and averaged nearly 0.12 m on tundra for the entire area. Water equivalent of the snowpack averaged more than 0.13 m in 1978. Snow-soil interface temperatures in 1977 ranged from about -20C on the coastal plain, where the snowpack was thin and ambient air temperatures were low, to about -5C in the mountains and foothills where the snowpack was thicker and ambient air temperatures higher. 2D. Evaporation and Transpiration

ENERGY BUDGET AND MONTHLY EVAPORATION ESTIMATES FOR LAKE SUPERIOR, 1973,
Canada Centre for Inland Waters, Burlington (Ontario).
W. M. Schertzer.
Journal of Great Lakes Research, Vol 4, No 3-4, p 320-330, December 1978. 6 Fig, 3 Tab, 38 Ref.

Descriptors: *Energy budget, *Evaporation, *Lake Superior, *Lake Ontario, Heat, Temperature, Parametric hydrology, Networks, Mass transfer, Boundary layers, *Evaporation estimates, *Thermal energy budget, Heat storage change, Network data, Water budget methods, Reflected global radiation, Long wave radiation, Emissivity.

Thermal energy budget components and monthly evaporation estimates were computed for Lake Superior, 1973. Temperature surveys were available from which monthly heat storage change could be evaluated. Other budget parameters were estimated partly from existing basin meteorological network data and partly from empirical relationships. Monthly evaporation estimates computed as a residual from the energy budget were compared to estimates given by the mass transfer and water budget methods. Agreement with the water budget results was within 1 cm for most months. Correspondence with the mass transfer values was less impressive. Large discrepancies occurred in summer situations when the boundary layer was stable and the mass transfer approach overestimated condensation. The thermal energy budget of Lake Superior was computed by assuming negligible contribution from such processes as heating from chemical and biological processes, heat conduction through the bottom, and transformation of kinetic energy to heat. 2E. Streamflow and Runoff

HYDROLOGIC CHARACTERISTICS OF AUSTRALIAN STREAMS,
Monash Univ., Clayton (Australia). Dept. of Civil Engineering.
T. A. McMahon.
Report No 3/1979, (1979). 86 p, 21 Fig, 9 Tab, 37 Ref.

Descriptors: *Streamflow, *Discharge(Water), *Hydrology, *Australia, *Data collections, Analysis, Annual peak discharge, Flow, River flow, Watersheds(Basins), Runoff, Monthly, Annual flood, Variability, Mathematical models, Analytical techniques, Statistical methods, Time series analysis, Annual runoff.

This report compares the Australian scene with other continents. It considers the time series characteristics of both annual volumes and peak annual discharges, and it recommends for each annual volume series the type of stochastic model necessary to reproduce the annual flow characteristics. This report is divided into three main parts--analyses concerned with annual flows, monthly flows, and peak annual discharges. In the analyses, data from 166 annual records and 158 monthly flows were used; 172 station records were used in the peak discharge analyses. More than 90% of the station records are longer than 20 years; those with less data are for stations located in areas where longer records are not available. The important conclusions are: (1) Overall, the Australian streams are far more variable than similar streams in other continents. (2) The effect of catchment area on annual C sub V is ambiguous. (3) No one theoretical distribution can be considered to fit adequately the flow volume data of all streams. (4) Based on six tests, about 75% of the records are considered to be random. (5) For stochastic generation of annual flow volumes, a white noise model is adequate for 76% of streams. (6) Analysis of monthly flows shows that the carryover effect of monthly moisture diminishes to an insignificant level after several months. (7) Average 95% flow duration values exhibit up to two orders of magnitude difference among drainage basins. (8) Mean specific peak discharges were related by a power function to drainage areas. The value of the exponent is -0.44 which fits other Australian estimates but differs from values found in other countries. (9) Average values for drainage divisions of the index of variability of peak annual discharges varied from 0.18 in Tasmania to 0.65 for the arid zone. The median value was 0.46. (10) Approximately 17% of the 133 streams with continuous records showed dependence of peak annual discharges. (Humphreys-ISWS)

A NOTE ON CHANGES IN CHANNEL GEOMETRY AT TRIBUTARY JUNCTIONS,
Hull Univ. (England). Dept. of Geography.
K. S. Richards.
Water Resources Research, Vol 16, No 1, p 241-244, February 1980. 3 Fig, 2 Tab, 19 Ref.

Descriptors: Geomorphology, *Streams, *Channels, *Width, *Model studies, Mathematical models, Rivers, Tributaries, Stochastic processes, Probability, Regression analysis, Drainage, Drainage patterns(Geologic), Hydrology, Hydraulics.

Evidence was presented to justify the assumption that channel width varies stochastically about an approximately constant mean width within a stream link of an alluvial channel. Adjustments of channel width occur predominantly at junctions, but Miller's simple model describing such changes is misleading, and an alternative was proposed whose implication is that channel width (and probably other channel dimensions) is a power function of link magnitude. It was suggested that an alternative to conventional hydraulic geometry is provided by the combination of a step function describing changes at junctions and a stochastic model of variation within individual links. COMPOSITE ROUGHNESS OF NATURAL CHANNELS,
Dames and Moore, Bethesda, MD.
A. K. Motayed, and M. Krishnamurthy.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 70-78, 1978. 1 Fig, 1 Tab, 7 Ref, 2 Append.

Descriptors: *Natural streams, *Roughness coefficient, *Mannings equation, *Cross-sections, Roughness(Hydraulic), Channels, Variability, Equations, Analytical techniques, Analysis, Composite roughness, Mannings n.

The purpose of this investigation was to evaluate some of the existing formulas to compute the composite roughness with data from natural stream channels. In this analysis the roughness of subsections was calculated by assuming a logarithmic velocity distribution in each subsection. However, it is not yet fully established that logarithmic velocity distribution is valid during high stages of flows in river channels. In order to evaluate any such formula for composite roughness, it is therefore desirable to have the data necessary to compute the energy gradient in a reach, like water surface slopes and/or velocity contours. It was recommended that more data of natural channels during flood conditions be collected so that a better evaluation of formulas can be made. (See also W80-05159) (Humphreys-ISWS)

HYDRAULICS OF FLOW IN THE KASKASKIA RIVER,
Illinois State Water Survey, Urbana.
N. G. Bhowmik, and J. B. Stall.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 79-86, 1978. 5 Fig, 1 Tab, 5 Ref.

Descriptors: *River flow, *Flow characteristics, *Illinois, On-site investigations, Hydraulics, Flow, Velocity, Distribution patterns, On-site data collections, Analysis, Discharge(Water), Head loss, Roughness coefficient, *Kaskaskia River(IL), Isovels.

Hydraulics of flow were investigated at two reaches in the Kaskaskia River for low, medium, and bankful discharges. Analysis of cross-sectional shapes indicates that a trapezoidal shape can be used for straight reaches and a parabolic shape for the bends. In the bends, the maximum depths, up to 100% greater than the average depth, were located at a distance of about 25% of the width from the outside bank. The core of the high velocity remained near the center of the cross-section in the straight reaches for all flows. However, in the bend a shifting was observed. The nature of this shifting indicated the presence of a stronger secondary circulation at medium flow. The strength of the secondary circulation decreased when the discharge increased toward the bankful stages. The secondary circulation in the bends modified the velocity structure making the differential between the average velocity and the maximum-point velocities to be smaller than those present in the straight reaches. The total head loss over the whole length of the river decreased as the discharge increased. The unit discharge at various verticals was found to be proportional to the respective depths. In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 280-302, 1978. 16 Fig, 5 Ref.

Descriptors: *Mathematical models, *Hydraulics, *Streamflow, Model studies, Equations, Mathematics, Mathematical studies, Numerical analysis, Analytical techniques, Evaluation, Numerical methods.

Superficially, the finite-difference method is deceptively simple. Past emphasis on stability criteria and not on numerical accuracy has lulled the hydraulic engineer into believing that numbers generated by a 'calibrated' model are correct. Mathematically, an accuracy analysis is relatively complex. However, a recipe can be written for any scheme so that accuracy portraits (both amplitude and phase) can be easily computed. Although not exact, these portraits give insight into the proper grid and time spacings to employ, whether implicit schemes are worthwhile, and other factors to insure a desired accuracy in the computations. For simulation and modeling applications, these concepts will permit more physically realistic calibration and verification phases of the prototype. For computer-based research, these ideas must be understood to insure that the 'data' generated numerically is as accurate as that measured by instruments in physical experiments. EXAMPLES OF PROPAGATION PROBLEMS,
North Carolina State Univ. at Raleigh. Dept. of Civil Engineering.
M. Amein.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 343-349, 1978. 4 Fig, 6 Ref.

Descriptors: *River flow, *Storm surge, *Model studies, Mathematical models, Computer models, Flow, Discharge(Water), Water levels, Hydrographs, Rivers, Bays, Hydraulics, Hydrology, Hydraulic propagation.

There are a number of practical propagation problems of concern to practicing engineers that can be correctly solved only by mathematical models requiring computers. Analytical solutions are not feasible, and hand-calculations would be time consuming. Among these are flood movements in rivers, dispersion of pollutants in estuaries and coastal waters, and computation of storm surge along the shores. Examples of propagation problems were presented. In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 455-464, 1978. 2 Fig.

Descriptors: *River forecasting, *Flood forecasting, *Mathematical models, Rivers, Floods, Water levels, Storage, Roughness(Hydraulic), Inflow, Dams, Locks, Hydrology, Dynamic wave models.

An operational hydrodynamic model (DWOPER) developed by the Hydrologic Research Laboratory of the National Weather Service is being placed in operational use by River Forecast Centers on a number of major river systems where storage routing methods are inadequate due to the effects of backwater, tides, and mild channel bottom slopes. The model is based on the complete one-dimensional St. Venant equations and belongs to the category of dynamic wave flood routing models. A weighted four-point nonlinear implicit finite difference scheme is used to obtain solutions to the St. Venant equations via a Newton-Raphson iterative technique. DWOPER has a number of features which make it applicable to a variety of natural river systems for real-time forecasting. It is designed to accommodate various boundary conditions and irregular cross-sections located at unequal distances along a single multiple-reach river or several such rivers having a dendritic configuration. It allows for roughness parameters to vary with location and stage or discharge. Temporally varying lateral inflows, wind effects, bridge effects, off-channel storage, and weir-flow channel bifurcations are included among its features. Applications of DWOPER to several large river systems have demonstrated its operational efficiency, accuracy, and utility. The model is currently being extended to account for effects of channel sinuosity, flood plains, sediment transport, and bank storage on unsteady flows in alluvial rivers. EFFECTS OF EQUATION AVERAGING ON MODEL VERIFICATION,

South Carolina Univ., Columbia. Dept. of Civil Engineering.
B. A. Benedict.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 483-491, 1978. 1 Tab, 17 Ref. USAF F08635-77-C-0237.

Descriptors: *Flow, *Diffusion, *Water quality, *Mathematical models, *Equations, Analytical techniques, Mathematics, Calibrations, Velocity, Streamflow, Hydrology, Pollutants, Path of pollutants, Equation averaging.

The concern over water quality has led to an increasing need for techniques to predict the behavior (movement, diffusion, and the like) of releases to a receiving water body. Analytical solutions to the diffusion equation are frequently used for these predictions. The basic equation of interest is the three-dimensional convective diffusion equation subjected to no-flux conditions at the air-water interface and at lateral and bottom boundaries. In arriving at a solution, one or more properties is averaged over one or more dimensions (including time) to obtain a tractable equation form. This paper was concerned with the important need to account for effects of these averaging processes when using data to verify these models. (See also W80-05159) (Sims-ISWS)

PREDICTION OF RIVER STAGES,

Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
R-M. Li, G. O. Brown, and D. B. Simons.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 541-550, 1978. 6 Fig, 1 Tab, 1 Ref, 2 Append.

Descriptors: *Water levels, *Rivers, *Forecasting, *Model studies, *Mississippi, Mathematical models, Stage-discharge relations, Discharge(Water), Calibrations, On-site investigations, Alluvial channels, *Yazoo River(MS).

Accurate prediction of the river stage for a given discharge is one of the most important problems in fluvial hydraulics. Prediction of stage discharge is necessary for analysis of flood-damage mitigation, sediment transport, navigation, and water quality. River stage can be predicted either by statistical stage-discharge relationships or by using deterministic physical process models. Presently, there are no guidelines regarding the application of these two approaches. The purpose of this paper was to examine the frequency and magnitude of error associated with each model by applying each method to two case studies. One case involves a relatively stable reach of river, while the other is unstable. Both models are relatively accurate for the stable reach. However, the mathematical model that considers the physical processes of open channel flow and fluvial geomorphology is the only feasible approach to predict the response of an active river. In addition, a probabilistic prediction of the river stage by coupling the deterministic model with a stochastic discharge input was demonstrated. (See also W80-05159) (Humphreys-ISWS)
W80-05206

TAXONOMY OF SOLUTIONS: UNSTEADY OPEN CHANNEL FLOW,

Soil Conservation Service, Glenn Dale, MD. Engineering Div.
F. D. Theurer.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 591-598, 1978.

Descriptors: *Open channel flow, *Unsteady flow, *Analytical techniques, *Systematics, Mathematical models, Analysis, Algorithms, Classification, Methodology.

A taxonomy of solutions for unsteady open channel flow problems was offered which, hopefully, will lead to a comprehensive classification system and ultimately to a quantitative basis for evaluating various solutions. A valid taxonomic approach would bring order to a classification system in an orderly, not arbitrary, manner. This is done by addressing three basic questions to each specific solution scheme: (1) how good will the answer be, (2) how can the answer be obtained, and (3) how much is it going to cost. These three questions lead directly to the major areas of differentiation: (1) the math model, (2) the method of solution, and (3) the technique of computation. The math model is the analytic representation. The method of solution and technique of computations are distinct parts of methodology. The development of an unsteady open channel flow computer model for large scale field use is needed. Future studies will require: (1) the classification and selection of the important solutions to minimize the study effort, (2) the development of a means to relate the hydraulic and hydrologic properties of channel system and hydrographs to the responses so that the results can be reliably generalized for field applications, (3) the selection of the scope of the study to reflect field situations, (4) the development of a single comprehensive computer analysis model to minimize differences between programmers, (5) the execution and interpretation of test data to develop logical dependable data-directed techniques for an operational computer program, and (6) the development of an operational, comprehensive, data-directed, user-oriented, efficient, accurate, reliable, and optimized computer model for unsteady open channel flow problems. In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 599-604, 1978. 5 Ref.

Descriptors: *Streamflow, *Subcritical flow, *Mathematical models, *Flood waves, Analytical techniques, Analysis, Equations, Discharge(Water), Open channel flow, Flood routing, Model studies, Kinematic flow equations.

Prediction of the behavior of a flood wave in a natural channel is essential in the design of channel improvements and flood control measures. The kinematic flow approximation has proven to be a very useful simplification in the determination of the movement of a flood wave down a channel and the prediction of any related changes in form or height of the wave. Integration of the momentum equation for kinematic flow in a wide rectangular channel for the cases of $b = 2.0$, $b = 2.5$, and $b = 3.0$ yields solutions for downstream flow depth at a given distance downstream, for a given set of physical conditions, and at a given point in time. Lateral inflow is independent of flow depth for the case of $b = 2.0$, and thus may be input into the solution as a step function. Momentum added by the lateral inflow was assumed to be negligible for the cases of $b = 2.5$ and $b = 3.0$. Thus a method of routing a flood wave through a natural channel under kinematic flow conditions was proposed. The only input required for the solution is the known physical information about the reach--the bed slope, Chezy C, width of the channel, and a single-valued rating curve--and the inflow hydrograph to the reach. This method of solution is also in the process of being made even more general by the numerical integration of the momentum equation. These solutions will have the added advantage of being applicable to any b value and may be used to verify the closed form analytical solutions of this study. (See also W80-05159) (Humphreys-ISWS)

APPLICABILITY OF KINEMATIC AND DIFFUSION MODELS,

Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. M. Ponce, R-M. Li, and D. B. Simons.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 605-613, 1978. 4 Fig, 1 Tab, 5 Ref, 3 Append.

Descriptors: *Mathematical models, *Open channel flow, *Flood waves, *Celerity, Model studies, Diffusion, Overland flow, Waves(Water), Analytical techniques, Analysis, Flood routing, Kinematic wave model.

The applicability of the kinematic and diffusion models was assessed by comparing the propagation characteristics of sinusoidal perturbations to the steady uniform flow for the kinematic, diffusion, and dynamic models (the dynamic model is that based on the complete Saint Venant equations). The comparison allows the determination of inequality criteria that need to be satisfied if the kinematic or diffusion models are to simulate the physical phenomena within a prescribed accuracy. It was shown that bed slope and wave period (akin to wave duration in waves of shape other than sinusoidal) are the important physical characteristics in determining the applicability of the approximate models. Larger bed slopes or long wave periods will satisfy the inequality criteria. In practice, larger bed slopes are those of overland flow, and long wave periods are those corresponding to slow-rising flood waves. The diffusion model was shown to be applicable for a wider range of bed slopes and wave periods than the kinematic model. Where the two models break down, only the dynamic model will simulate the physical phenomena. The dynamic wave, however, was shown to have markedly strong dissipative tendencies. This conclusion has had ample corroboration in the literature. (See also W80-05159) (Humphreys-ISWS)

THE NUMERICAL DISPERSION OF THE MUSKINGUM METHOD,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. M. Ponce, V. Yevjevich, and D. B. Simons.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 614-620, 1978. 2 Fig, 4 Ref, 2 Append.

Descriptors: *Flood routing, *Mathematical models, *Analytical techniques, Analysis, Dispersion, Numerical analysis, Equations, Mathematical studies, Kinematic wave equation.

It was the objective of this paper to further explore the nature of the numerical dispersion underlying the formulation of the Muskingum method. The findings reported should contribute to the increased understanding of the method and thus enhance its use and applicability for a wide range of flood routing problems. The analogy between the Muskingum formulation and the diffusion wave equation was demonstrated; both have the same limits of applicability. The applicability of the diffusion wave model has been established by Ponce and others on theoretical grounds. The numerical dispersion underlying the formulation of the Muskingum method was critically reviewed. A sensitivity analysis shows the calculated Muskingum discharge to be a bounded function of the Courant number and the cell Reynolds number. (See also W80-05159) (Humphreys-ISWS)

CONTROL OF UNSTEADY FREE-SURFACE FLOW WITH GATES,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
E. B. Wylie, and W. E. Bodley.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 767-774, 1978. 7 Fig, 6 Ref.

Descriptors: *Open channel flow, *Flow control, *Gates, Unsteady flow, Analytical techniques, Analysis, Reservoirs, Discharge(Water), Flow, Depth, Movement, Gate stroking.

The purpose of this paper was to show how the concept can be applied to a series of any number of pools separated by control gates. The application was illustrated for a series of three pools, separated by underflow gates, the series also originating and terminating in underflow gates, both with reservoir conditions on the other side. Channel dimensions and other properties were chosen to be representative of the California Aqueduct, for which empirical methods of control have been presented by Dewey and Madsen. Two typical demand changes were studied--flow initiation (0 to 3,520 cfs in 78 min), and flow arrest (6,000 cfs to 0 in 84.5 min). In each case, a linear change between the initial and the final demands was prescribed. The volume of water in each pool was maintained approximately constant throughout each demand change. The required motions of all control gates were determined, together with the transient water level variations that result from the imposed patterns of demand change. The results of all 'gate-stroking' calculations were confirmed by 'analysis.' (See also W77-10891 and W80-05159) (Humphreys-ISWS)

FLOOD HAZARD IDENTIFICATION AND FLOOD PLAIN MANAGEMENT ON ALLUVIAL FANS,
Army Engineer Div. North Pacific, Portland, OR.
L. M. Magura, and D. E. Wood.
Water Resources Bulletin, Vol 16, No 1, p 56-62, February 1980. 8 Fig, 6 Ref.

Descriptors: *Alluvial fans, *Flood plain insurance, *Southwest U.S., Management, Floods, Flood damage, Flood frequency, Flood waves, Flood flow, Erosion, Sediments, Design flood, Historic floods, Flash floods, Insurance, Hazards.

Recognition of the flood hazard that exists on alluvial fans has seriously lagged behind the recognition of other more conventional flood hazards such as those associated with most rivers. This delay in recognition was due, until recently, to a general lack of economic investment and development in these areas and a concomitant lack of historical alluvial fan flood damage. Dramatic recent events, such as Tropical Storm Kathleen, emphasized to the Federal Insurance Administration (FIA) the need for developing an appropriate methodology to identify flood hazard areas on alluvial fans. This paper presents the methodology now employed by FIA as well as flood plain management considerations that could reduce future flood related damage to communities developing in these areas. Geological Survey Water-Resources Investigations 79-3, May 1979. 54 p, 26 Fig, 16 Tab, 24 Ref.

Descriptors: *Stochastic processes, *Streamflow, *Model studies, *Statistical models, *Flow characteristics, High flow, Low-flow, Natural flow, Correlation analysis, Frequency analysis, Regional analysis, Synthetic hydrology, Time series analysis, Pennsylvania, *Juniata River basin(Pa), *Autoregressive Integrated Moving Average(ARIMA), Dissaggregation.

An ARIMA (1,0,1) model was calibrated and used to generate long annual flow sequences at three sites in the Juniata River basin, Pennsylvania. The model preserves the mean, variance, and cross correlations of the observed station data. In addition, it has a desirable blend of both high and low frequency characteristics and therefore is capable of preserving the Hurst coefficient, h. The generated annual flows are disaggregated into monthly sequences using a modification of the Valencia-Schaake model. The low-flow frequency and flow duration characteristics of the generated monthly flows, with length equal to the historical data, compare favorably with the historical data. Once the models were verified, 100-year sequences were generated and analyzed for their low flow characteristics. One-, three- and six- month low-flow frequencies at recurrence intervals greater than 10 years are generally found to be lower than flow computed from the historical flows. A method is proposed for synthesizing flows at ungaged sites. (Kosco-USGS)

er models, Hydraulic models, Groundwater movement, Path of pollutants, Wells, Water wells, Pumping, Hydrology, Model usage, Modeling concepts.

Groundwater modeling is a tool that can help analyze many groundwater problems. Models are useful for reconnaissance studies preceding field investigations, for interpretive studies following the field program, and for predictive studies to estimate future field behavior. In addition to these applications, models are useful for studying various types of flow behavior by examining hypothetical aquifer problems. Before attempting such studies, however, one must be familiar with groundwater modeling concepts, model usage, and modeling limitations. (Sims-ISWS)

This note presented a technique used to evaluate drawdown and recovery data obtained during step-pumping tests or during several episodes of intermittent pumping. First, the simple general equation was presented that relates the usual variables (drawdown, transmissivity, storativity, etc.) to step-wise changes in discharge. (Intermittent pumping equates to a step with zero discharge.) Then it was shown how the equation provides a basis for determining transmissivity and storativity of the water-yielding rocks using nearly all the data simultaneously. Next it was discussed how departures of the data during conventional step-drawdown tests from the ideal provide other useful hydrogeologic information. Finally some examples were given from field experience. (Sims-ISWS)

The Fort Payne Formation of Early Mississippian (Osagean) age crops out over extensive areas of central Tennessee, south-central Kentucky, and northern Alabama. Specific formation lithologies are knwon to have been modified locally through weathering into an artesian aquifer along the Eastern Highland Rim of central Tennessee. The shallow aquifer can be divided into two parts; uppermost is a highly permeable chert gravel zone that is in hydraulic communication with a lower zone of interconnected solution cavities within bedrock. The gravel, at depths as great as 24.4 m (80 ft), fines upward into the clay-sized chert of the upper confining bed. The lower confining bed is the Chattanooga Shale of Late Devonian to Early Mississippian age. Field and petrographic studies of the Fort Payne Formation indicate that the aquifer has developed near the base of the unit. The chert gravel portion of the aquifer has developed from silicified dolowacke-stones of the Beaver Creek Limestone Member and from interbedded Fort Payne dolostones. The lower portion of the aquifer occurs within preferentially weathered, silicified and nonsilicified dolosiltstone. (Sims-ISWS)

A comparison of the concentrations of nitrate in three public supply borehole sources, which abstract water from the Chalk in a relatively local area, lead to a more detailed study of the possible causes of high nitrate values at one of the sources and the geological and recharge characteristics of all three. The local catchment area of the high nitrate source is actively fertilized, both by sludge spreading and the application of artificial fertilizers. The catchment areas of the other two groundwater sources are not subject to the same intensive agricultural activity. It was suggested that the differences in water quality between the three supplies are related to the variations in land use and the local hydrogeology. The study made it clear that due to local influences each source may have a unique hydrogeochemical character irrespective of being located in the same regional geological catchment area. More detailed investigations on the origins of the nitrate in the abstracted groundwaters are planned as a follow-up to this initial study. (Sims-ISWS)

PERTURBATION SOLUTIONS FOR WATER-TABLE AQUIFERS,
Geological Survey, Tacoma, WA.
E. A. Prych.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No HY-4, p 603-608, April, 1980. 3 Fig, 3 Ref.

Descriptors: *Perturbation method, *Unsteady flow, *Ground water movement, *Water table aquifers, Equations, Numerical analysis, Transmissivity, Approximation method.

This paper describes a linearization procedure, based on a perturbation method, which can be used for solving the unsteady equation of motion for two-dimensional ground water flow in a water-table aquifer. This method retains the computationally efficient aspects of the method of specified transmissivities, yet partially accounts for the effect of the time-varying saturated thickness on the transmissivity. Consequently, numerical solutions of the perturbation equations can be more accurate than solutions of the equation with specified transmissivities. The only significant additional computation required with the perturbation method is the solution of one nonlinear steady-state problem. (Purdin-NWWA)

CALIBRATION OF THE EDWARDS AQUIFER MODEL,
Texas Dept. of Water Resources, Austin.
T. Knowles, and W. B. Klemt.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 94-100, 1978. 1 Fig.

Descriptors: *Model studies, *Aquifers, *Texas, *Groundwater, Aquifer management, Planning, Calibrations, Springs, Recharge, Computer models, Aquifer characteristics, Water levels, *Edwards Aquifer(TX).

The Edwards Aquifer Model was developed to determine the dependability of the Edwards (Balcones Fault Zone) aquifer as a water supply for the San Antonio, Texas, area. The model was developed to be a groundwater planning tool which would allow evaluation of the impacts of future pumpage on the aquifer. The model allows input of various sequences of recharge and pumpage and determines the resulting water levels and spring flows. The calibration procedure involved the adjusting of the initial estimates of the model's parameters until sufficiently accurate reproduction of water levels and spring flows were achieved. The period of record used in the calibration extended from 1947 through 1971. Most of the adjustments made during the calibration phase of the model development involved changing permeability values. This was due in large part to the confidence in the other values. The Edwards model has been used to evaluate several alternative development plans. Its results have been used in several studies, and it has proven to be an effective planning tool. The acceptance of the results provided by the model is due in large part to the effort applied in developing the data used during the calibration phase of its development. STEADY STATE VS. TRANSIENT PARAMETER ESTIMATION IN GROUNDWATER SYSTEMS,
Massachusetts Inst. of Tech., Cambridge.
J. L. Wilson, and M. Dettinger.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 112-119, 1978. 6 Ref, 1 Append. AID-NE-C-1291, OSP 85054.

Descriptors: *Aquifer systems, *Groundwater, *Model studies, Steady flow, Mathematical models, Analytical techniques, Analysis, Mathematical studies, Unsteady flow, Groundwater movement, Equations, Deterministic model, Parameter estimation.

The objective of this paper was to contrast the information content of field data from static observations to observations made during different levels of transient aquifer response. Linear predictive aquifer models based on First Order Analysis, accounting for system state and parametric uncertainty, were used in conjunction with the Kalman-Bucy Filter to predict future aquifer behavior and to obtain sequential parameter estimates. A simplification of these models was used for the estimation of parameters for steady state conditions. The analysis results demonstrated that static or slowly responding systems are relatively insensitive to the values of parameters, and consequently the parameters are difficult to estimate. For more rapidly responding and highly stressed systems the param-

eter sensitivity and the information content of measurements is significantly increased. (See also W80-05159) (Humphreys-ISWS)

Descriptors: *Groundwater, *Water management(Applied), *Analog models, Aquifers, Model studies, Hybrid computers, Resistance networks, Water utilization, Rainfall, Water wells, Canals, Instrumentation, Evapotranspiration, Calibrations, Hybrid models.

In this paper those aspects of analog simulation related to the South Florida Water Management District (SFWMD) model were discussed. The fluid flow of the aquifer is assumed to be described by the two-dimensional unsteady state equation. The study area was a water table aquifer; however, variations of saturated thickness were small in comparison to the total saturated thickness. The analog simulator was constructed in space-discretized form with a node representing a block area acceptable in space resolution. Since the system gives continuous response in time, the results may be obtained at any time desired. Calibration of the model was accomplished by subjective comparison of the model results and historical water table maps. Both initial condition setup and results after a period of operation are checked for validity. The analog model, with its simplicity in principle, offers a reasonable starting point in cases where there is scarce data. As a specific area simulation tool, the model is used in many different ways, accumulating experiences and knowledge of the aquifer system. At this point, it seems the simplicity in analog approach is becoming a limitation. While the analog model is still in active operation, in preparing for refinement of the Water Use Plan, a digital computer model has already been started. (See also W80-05159) (Humphreys-ISWS)

THE OPTIMIZATION OF PUMPING OPERATIONS IN THE EL SOCORRO AQUIFER BY MATHEMATICAL MODELLING,
National Water Authority of Jamaica (West Indies).
G. S. Shrivastava.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 214-221, 1978. 3 Fig, 1 Tab, 3 Ref, 2 Append.

Descriptors: *Aquifer systems, *Mathematical models, *Water management(Applied), Pumping, Optimization, Hydrogeology, Model studies, Saline water intrusion, Water levels, Groundwater, Aquifer characteristics, Foreign research, Analytical techniques, *Trinidad.

This study began with an investigation of the hydrogeology of the aquifer. The possible sources and mechanisms of intrusion were also examined. A digital simulation model of the aquifer was developed to study the effect of different monthly pumping schedules on the aquifer. During the development of the simulation model it became evident that the salt water intrusion problem had the characteristics of an optimization problem and that the processes of the aquifer were sequential in nature. A simple one-dimensional dynamic programming model was then developed and solved to obtain the desired pumping schedule. The optimum pumping schedule obtained by the application of digital simulation and dynamic programming techniques should prevent further deterioration of water quality and permit the aquifer to remain a significant source of water for the city of Port-of-Spain. The present mathematical models were developed on very limited data, and therefore refinement and extension of the models, as more data becomes available, is expected to considerably improve their effectiveness. HYDRAULIC PROPERTIES OF A LIMESTONE-DOLOMITE AQUIFER NEAR MARION, NORTH-CENTRAL OHIO,
Geological Survey, Columbus, OH. Water Resources Div.
S. E. Norris.
Ohio Department of Natural Resources Report of Investigations No 110, 1979. 23 p, 22 Fig, 4 Tab, 19 Ref.

Descriptors: *Hydraulic properties, *Limestones, *Aquifers, *Ohio, *Hydrogeology, Aquifer characteristics, Transmissivity, Water wells, Water yield, Pumping, Drawdown, Natural recharge, Leakage, Water supply, Waterfowl, *North-central Ohio, *Big Island Wildlife Area(Ohio).

Tests of a limestone-dolomite aquifer overlain by till at a site near Marion in north-central Ohio indicate strong aquifer heterogeneity, with hydraulic conductivity varying both laterally and vertically. The most conductive part of the aquifer is a 70-foot-thick section between depths of 80 and 150 feet, characterized by fissures and cavities. Transmissivity in the immediate vicinity of the pumped well is in the magnitude of 47,000 cu ft/d, falling to about 2,800 cu ft/d in the outer part of the cone of depression. An integrated value for transmissivity, determined from time-drawdown data by the straight-line semilogarithmic method, averaged about 3,600 cu ft/d; the coefficient of storage averaged about 10 to the minus 4th power. The effect of recharge by leakage from the glacial till was evident on the semilog graphs of time versus drawdown after 4,000 to 6,000 minutes of pumping. The hydraulic conductivity of the glacial till, based on an average regional saturated thickness of 35 feet, is the range of 1.0 x 10 to the minus 4th power to 3.4 x 10 to the minus 4th power feet per day. It is estimated that about half the quantity of 3,000 gal/min of ground water desired for a wildfowl preserve could be obtained from three existing production wells, but such withdrawal would be accompanied by significant drawdown over a wide area that might adversely effect the water supplies of many residents. (Kosco-USGS)

2G. Water In Soils

ANALYSIS OF BOREHOLE INFILTRATION TESTS ABOVE THE WATER TABLE,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. B. Stephens, and S. P. Neuman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-188345, Price codes: A10 in paper copy, A01 in microfiche. Water Resources Research Center, University of Arizona Project Completion Report, March 1980. 216 p, 104 Fig, 4 Tab, 55 Ref, 7 Append. OWRT A-076-ARIZ(1).

Descriptors: *Infiltration, *Boreholes, *Model studies, Hydraulic models, Mathematical models, Soil water movement, Subsurface flow, Unsaturated flow, Water table, Finite element analysis, Hydraulics, Specific head, Soil mechanics, Flow characteristics.

Numerical models were used for a saturated-unsaturated analysis of the formulas used in analyzing results from constant head borehole infiltration tests of saturated hydraulic conductivities of unsaturated soils above the water table. A finite element model capable of solving free surface problems shows that in the case where unsaturated flow is not present, the formulas are reasonably accurate for a practical range of borehole conditions. Two different numerical models, a mixed explicit-implicit finite element model and a mixed explicit-implicit integrated finite difference model are used to simulate the effect of unsaturated flow on borehole infiltration under conditions approximating field conditions. While the models give approximately the same results, the integrated finite difference model is faster. Modeling results show that the classical free surface approach used to analyze infiltration results gives a distorted flow pattern for water in the soil. A significant percentage of the flow occurs under unsaturated conditions and only a finite region in the immediate area of the borehole is saturated. An improved design for borehole infiltration tests was developed along with more accurate interpretation methods. (Seigler-IPA)

A SIMPLE NUMERICAL SOLUTION FOR THE VERTICAL FLOW EQUATION OF WATER THROUGH UNSATURATED SOILS,
Technische Univ., Hanover (Germany, F.R.). Inst. fuer Bodenkunde.
J. Richter.
Soil Science, Vol 129, No 3, p 138-144, March 1980. 10 Fig, 1 Tab, 7 Ref.

Descriptors: *Soil water movement, *Numerical analysis, *Unsaturated flow, *Mathematical models, Percolation, Equations, Soil water, Soils, Computer programs, Hydraulic conductivity, Darcys law, Exponential function.

A simple numerical method to solve the vertical flow equation of water through unsaturated soils is presented. The method is based on the approximation K = K sub O X e to the alpha(psi) power and can be used for any range of soil moisture. The method uses the behavior of the exponential function in an integrated flux formula. The resulting numerical scheme is extremely easy to program and runs about as fast on microcomputers as implicit techniques do on large computers. Mass conservation is also excellent. (Visocky-ISWS)

A new analytical approximation to the solution of the diffusion equation is so accurate that it will be sufficient for most purposes. In addition, two simple iterations yield a profile that shows the influence of water movement at the initial moisture content. At that stage, the limit to the validity of the diffusion equation is reached, and further iterations are irrelevant. The results were illustrated for an exponential diffusivity. (Sims-ISWS)

COMPARISON BETWEEN MEASURED AND SIMULATED PLANT WATER POTENTIAL DURING SOIL WATER EXTRACTION BY POTTED RYEGRASS,
Louvain Univ. (Belgium). Lab. of Soil Physics.
J. Feyen, C. Belmans, and D. Hillel.
Soil Science, Vol 129, No 3, p 180-185, March 1980. 5 Fig, 23 Ref.

Descriptors: *Soil water, *Soil-water-plant relationships, *Evapotranspiration, *Model studies, Mathematical models, Laboratory tests, Evaporation, Grasses, Leaves, Wilting, Water-requirements, Agriculture, Soil science, Soil water extraction.

A combined simulation-experimentation study was conducted to monitor the simultaneously changing states of plant water and of soil water during a period of continuous transpiration by uniformly rooted ryegrass, grown in pots filled with sandy soil, under two levels of evaporative demand. The pattern of soil moisture extraction was measured by weighing and tensiometry, and that of plant water potential, by leaf psychrometry. A macroscopic-scale extraction model, previously published by the authors, was modified to account for the water-storage characteristics of the crop. Both the original and the modified versions of the model were found able to provide a realistic description of the diurnal fluctuations of plant water potential during the period prior to the onset of plant water stress, but they were less realistic in describing the decline of plant water potential during the dehydration and wilting phases. The rehydration of the crop from a stressed condition could be simulated realistically only by assigning a higher value of root resistance than during the initial extraction phase. (Sims-ISWS)

WATER-MANOMETER TENSIOMETERS INSTALLED AND READ FROM THE LAND SURFACE,
Geological Survey, Syosset, NY. Water Resources Div.
E. T. Oaksford.
Geotechnical Testing Journal, Vol 1, No 4, p 199-201, 1978. 6 Fig. American Society for Testing and Materials, Philadelphia, Pennsylvania.

Descriptors: *Manometers, *Tensiometers, *Instrumentation, *Soil moisture, Measurement, Artificial recharge, Infiltration rates, Recharge ponds, Evaluation, New York, *Long Island(NY), *Water-manometer tensiometers.

Soil-moisture tension has been measured beneath an artificial-recharge basin in Suffolk County, Long Island, N.Y. with water-manometer tensiometers that can be installed and read from the land surface. The manometer-tensiometer unit is buried at the desired depth, and soil-moisture tension is measured from land surface with a simple wire probe and electrical circuit that detect the level of water in the manometer. The water manometer is more sensitive than other common methods for determining unsaturated pressure head or soil-moisture tension over small ranges and is most helpful in situations where small changes in soil-moisture tension can reflect significant changes in hydraulic conductivity. Although the configuration may not be appropriate for installation at great depth (greater than 6 meters) or in extremely coarse or fine soils, it provides rapid, reliable measurement of soil-moisture tension. INVESTIGATIONS OF SPARGING AS A METHOD FOR PROMOTING COOLING POND HEAT TRANSFER,
Argonne National Lab., IL. Atmospheric Physics Section.
B. B. Hicks.
Journal of Applied Meteorology, Vol 19, No 2, p 193-198, February 1980. 2 Fig, 1 Tab, 6 Ref, 1 Append.

Descriptors: *Heat transfer, *Cooling water, *Lakes, Ponds, Water temperature, Cooling, Thermal stratification, Subsurface investigations, Air-water interfaces, Sprinkling, Heat balance, *Sparging, *Cooling pond, Subsurface, Air bubbles, Aeration rates, Infrared thermometry, Sensible heat.

Destruction of the thin subsurface thermal boundary layer at an air-water interface can be accomplished by relatively low rates of aeration and can result in substantially improved thermal performance when water temperatures are high. The heating and saturating of rising air bubbles can also provide a significant improvement in overall thermal performance when water temperatures and aeration rates are sufficiently great. At 80C, destruction of the subsurface thermal boundary layer allows about 10% more heat transfer without significant increase in water temperature. At 20C, destruction of the subsurface thermal skin results in only a 3% improvement in thermal efficiency. The practical benefits of sparging as a heat transfer improvement mechanism are highest in the case of very hot water bodies associated with emergency cooling systems. (Roberts-ISWS)

TURBID RESERVOIR STRATIFICATION MODELLING,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
S. Dhamotharan, H. G. Stefan, and F. R. Schiebe.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 156-163, 1978. 4 Fig, 2 Ref.

Descriptors: *Reservoirs, *Stratification, *Model studies, *Arkansas, Turbidity, Lakes, Suspended solids, Water temperature, Density stratification, Thermal stratification, Forecasting, On-site investigations, *Lake Chicot(AR).

A study to understand the dynamic characteristics of Lake Chicot, Arkansas, and to formulate a mathematical model to predict the effects of management alternatives on suspended loads is being carried out jointly by the University of Minnesota and the USDA Sedimentation Laboratory. The data taken so far show that the lake is a monomictic lake. In 1976 and 1977 the fall overturn of the lower lake started around the last week of September, after which period the lake stayed well mixed until about the first week of May when stratification started again. The upper lake remained stratified between the last week of May and the first week of September. Lake Chicot, with its shallow depth and large surface area, responds readily to the daily weather conditions. The mathematical simulation of the density stratification of Lake Chicot is therefore based on a method using energy principles and developed by Stefan and Ford. From the simulation results, the period of stratification as a function of weather conditions and heat exchange with the atmosphere was readily apparent, and also the periods of short-term or microstratification. The simulation also provides information on the daily equilibrium temperature which the water attempts to assume. (See also W75-04705 and W80-05159) (Humphreys-ISWS)

MATHEMATICAL THERMAL MODEL FOR PUMPED-STORAGE,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Hydraulics Lab.
M. S. Dortch.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 492-499, 1978. 3 Fig, 6 Ref.

Descriptors: *Pumped storage, *Reservoirs, *Water temperature, *Model studies, Mathematical models, Hydroelectric power, Powerplants, Pumping, Mixing, Diffusion, Stratification, Temperature, Solar radiation, Lakes.

Kinzua Dam, completed in 1967 and operated by the U.S. Army Engineer District, Pittsburgh, is a pumped-storage hydropower (380 MW capacity) project located on the Allegheny River in northern Pennsylvania. Colder than desired release temperatures have been experienced at Kinzua Dam during the stratification season. A study was initiated during 1977 at the U.S. Army Engineer Waterways Experiment Station to determine the causes of the cooler than expected release temperatures and to evaluate various means of increasing the release temperatures to more closely match natural stream temperatures. A mathematical model is being used in the study to help evaluate corrective measures. This paper dealt with the calibration and verification of this model for pumped-storage operations at Kinzua Dam. The effect of pumped-storage on temperature is to decrease stratification by redistributing heat from the upper layers of the pool to the lower layers. This is evident by the large value of the diffusion coefficient that was required to simulate the temperatures of the bottom layers. The mathematical model, which was developed for computing the thermal budget of pumped-storage reservoirs, has a rather simple approach and provides reasonably good thermal predictions. AN ELECTRONIC MODEL OF HARBOR WAVES,
Oklahoma Univ., Norman. Dept. of Civil Engineering,
M. M. Sternfeld, L. J. Pratt, and P. L. Monkmeyer.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 574-582, 1978. 6 Fig, 7 Ref.

Descriptors: *Waves(Water), *Harbors, *Analog models, *Model studies, Analytical techniques, Lakes, Theoretical analysis, Mathematical models, Finite element analysis, Instrumentation, *Port Washington(WI).

In an effort to uncover a less expensive and faster alternative to the physical model, an electronic model was described and subjected to preliminary testing in the present investigation. The theoretical background was developed, and the electronic analog was presented. Two separate tests of the model were described: the first simulating a uniform wave train propagating over a sloping bottom, and the second simulating a portion of the harbor of Port Washington, Wisconsin. Experimental and electronic wave envelopes were obtained by simulating a wave of period 1.8 sec. The discrepancy in phase and reflection coefficient between the two envelopes was less than 10%, a result typical of all the runs made. The major dissimilarity between the two profiles was in the variation of wave height over the sloping bottom. The electronic model predicts a decrease in height as shallow water is approached, a result contrary to both theory and experiment. This effect appears to be due to damping in the electronic circuit which seems to become significant when shallow, variable depth regions are being modeled. A resolution of this difficulty remains to be found. It is felt that with further minor modifications and refinements the model may become a relatively inexpensive alternative to the laboratory scale model. (See also W80-05159) (Humphreys-ISWS)

PHOSPHORUS DYNAMICS IN A NORTH CAROLINA PIEDMONT RESERVOIR,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
E. J. Kuenzler, and L. E. Greer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-188691, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Institute of the University of North Carolina, Raleigh, Report No UNC-WRRI-80-154, January 1980. 65 p, 14 Fig, 14 Tab, 104 Ref. OWRT A-102-NC(2).

Descriptors: *North Carolina, *Phosphorus, *Nutrients, *Nutrient removal, Lake stages, Eutrophication, Water sampling, Suspended solids, Lake sediments, Aquatic algae, Aquatic bacteria, Water temperature, Hypolimnion, Limnology, Epilimnion.

University Lake, a water-supply impoundment in the Piedmont Province of North Carolina, was sampled twice monthly for ten months to determine the patterns of phosphate uptake at different depths throughout the year. The lake is warm-monomictic or dimictic, has an area of 73 ha, a maximum depth of 9m, and an average depth of 3m. The lake is oxygenated at all depths in winter but beginning in March, thermal stratification prevents oxygen transport to the hypolimnion. Samples were taken with a Guzzler hand pump equipped with a plankton net to exclude zooplankton and macroinvertebrates and with a similarly equipped APHA stream sampler. Both chemical analyses and kinetic measurements were made. Filterable reactive phosphate concentrations were low with phosphate being half of the total P in winter but less than a quarter in the other seasons. Inorganic nitrogen concentrations in surface waters were also low. A range of phosphate rate coefficients was found from about 0.06% removal from surface water per minute in January to 40% per minute in June. Algal phosphate uptake was negligible throughout winter but became dominant in June. Results showed bacterial uptake exceeding algal uptake but measurement techniques for these values are questionable. In winter uptake was dominated by suspended sediments. Phosphorus was found to be the most probable major nutrient limiting phytoplankton growth in the lake. (Seigler-IPA)

A FACTOR ANALYSIS OF ELEMENTAL ASSOCIATIONS IN THE SURFACE MICROLAYER OF LAKE MICHIGAN AND ITS FLUVIAL INPUTS,
Michigan Univ., Ann Arbor. Dept. of Atmospheric and Oceanic Science.
J. E. Mackin, R. M. Owen, and P. A. Meyers.
Journal of Geophysical Research, Vol 85, No C3, p 1563-1569, March 20, 1980. 5 Fig, 3 Tab, 52 Ref. NSG 04-7-158-44078.

Descriptors: *Lake Michigan, *Geochemistry, *Fluvial sediment, Sediments, Geology, Watersheds(Basins), Limnology, Lakes, Sampling, Statistical methods, Chemical analysis, Surface waters, Surface microlayer, Factor analysis, Sediment chemistry.

Elemental concentrations in surface microlayer and subsurface water samples from Lake Michigan and from its major fluvial sources were subjected to separate R mode factor analyses to define the geochemical phases and mechanisms which influence the composition of the surface microlayer. The associations revealed by these analyses indicate that the composition of fluvial microlayers is controlled by localized factors related to the geology of individual drainage basins, while open lake microlayers are influenced by broad scale physiochemical interactions. Depletions of both dissolved and particulate phase constituents in fluvial microlayers are attributed to upward diffusion of ions in sediment pore fluids and resuspension of bottom sediments. Enrichments of these constituents in open lake microlayers are due to organic complexation, biological uptake, and bubble flotation of fine-grained mineral particles. (Lee-ISWS)

TIME SCALES IN WIND-DRIVEN LAKE CIRCULATIONS,
National Weather Service, Silver Spring, MD. Systems Development Office.
M. A. Mohammed-Zaki.
Journal of Geophysical Research, Vol 85, No C3, p 1553-1562, March 20, 1980. 11 Fig, 14 Ref, 2 Append.

Descriptors: *Lakes, *Circulation, *Lake breezes, Turbulent flow, Eddies, Fluid mechanics, Winds, Limnology, Viscosity, Friction, Mathematical models, Model studies, *Lake circulation, Wind driven circulation, Linearized Ekman equation, Wind stress.

The effect of turbulent friction on transient three-dimensional wind-driven circulation in large lakes was studied. Horizontal friction was neglected, and vertical friction was modeled by a constant eddy viscosity. The linearized Ekman equations were used in a constant depth lake model which was assumed deep (of small Ekman number). High-frequency transients due to acoustic, internal, and surface gravity wave modes were eliminated through assumptions of incompressibility, homogeneity, and rigid lid surface, respectively. The initial value problem arising from a suddenly imposed wind stress on an initially quiescent lake was analytically solved, and significant time scales were identified. It was found that the manner in which transient currents adjust to temporal variations in wind stress depends not only on a lake's physical parameters but also on the wind stress spatial pattern. While the inertial period is always significant, the spin-up time is significant only when the wind stress has a nonzero curl. (Lee-ISWS)

GROWTH INHIBITION OF HYDRILLA VERTICILLATA BY SELECTED LAKE SEDIMENT EXTRACTS,
Southwest Florida Water Management District, Brooksville.
P. M. Dooris, and D. F. Martin.
Water Resources Bulletin, Vol 16, No 1, p 112-117, February 1980. 2 Fig, 1 Tab, 29 Ref.

Descriptors: *Plant growth, *Plant growth regulators, *Sediments, *Lakes, *Florida, Weed control, Aquatic weeds, Aquatic weed control, Inhibitors, Water chemistry, Chemical analysis, Laboratory tests, Biology, Limnology, Growth inhibitors.

Sediments were investigated from two Florida lakes that have not been infested with the submersed, perennial, noxious plant Hydrilla verticillata. Aqueous extracts of the peat-like sediments from these lakes were shown to inhibit the growth of Hydrilla verticillata in laboratory systems. The extracts have substantial concentrations of organic carbon and iron. The apparent molecular weight of the inhibitory fraction is between 2,000 and 10,000, based upon ultrafiltration studies. Hydrilla growth was about 35% relative to control for a partially purified fraction at a level of 0.4 ppm organic carbon. Growth was measured as change in biomass (wet and dry) over a one-week period. The inhibitory material was highly fluorescent, dark brown, and inhibitory activity was lost after passage over an anion-exchange column (Cellex-D). (Sims-ISWS)

BENTHIC DIVERSITY AND SUBSTRATE-FAUNA ASSOCIATIONS IN LAKE SUPERIOR,
Canada Centre for Inland Waters, Burlington (Ontario).
R. Dermott.
Journal of Great Lakes Research, Vol 4, No 3-4, p 505-512, December 1978. 3 Fig, 3 Tab, 37 Ref.

Descriptors: *Lake Superior, *Benthos, *Biomass, *Limnology, Sediments, Zinc, On-site investigations, Aquatic life, Invertebrates, Nematodes, Spatial distribution, Oligochaetes, Benthic fauna, Surveys, Lakes, *Whitefish Bay(MI), *Duluth Basin, Diversity weight.

The benthic community of Lake Superior was dominated by Pontoporeia affinis, Stylodrilus heringianus, the Enchytraeidae, and Pisidium conventus. Both total abundance and the low benthic diversity displayed an increase from west to east. The biomass diversity H' weight ranged from 0.29 in the Duluth Basin to 1.22 near Whitefish Bay. Associations between the sediment variables and dominant species present indicated that the effects of depth, percent sand, and mean particle size were prominent. The Sphaeriidae, Chironomini, Pontoporeia, and Rhyacodrilus were negatively associat-

ed with depth, while the Nematoda, Chironomini, and Rhyacodrilus were negatively associated with sand. Stylodrilus and Sphaeriidae were negatively associated with the sediment zinc levels. (Humphreys-ISWS)

PHYTOPLANKTON-ZOOPLANKTON ASSOCIATIONS IN LAKE SUPERIOR: A STATISTICAL APPROACH,
Canada Centre for Inland Waters, Burlington (Ontario).
M. Munawar, and J. B. Wilson.
Journal of Great Lakes Research, Vol 4, No 3-4, p 497-504, December 1978. 1 Fig, 5 Tab, 25 Ref.

Descriptors: *Lake Superior, *Phytoplankton, *Zooplankton, *Limnology, *Data processing, Lakes, Analytical techniques, Analysis, Statistical methods, Sampling, Correlation analysis, Data collections, Crustaceans, Aquatic life, Biomass, Water temperature.

Very little is known about the multiple phytoplankton-zooplankton links in complex food chains. Lake Superior, with a zooplankton population dominated by herbivores, and a phytoplankton community consisting mainly of nannoplankton, is a unique environment for the study of plankton associations. Appropriate statistical techniques, including partial correlations, canonical correlations, and factor analysis, were used to analyze phytoplankton-zooplankton data collected concurrently on Lake Superior during 1973. The multivariate methods revealed more detailed, but less easily interpretable, patterns than did the partial correlations. Over the entire sampling season, canonical correlation and factor analysis produced three significant roots and three multivariate factors, respectively. Temperature was a strong first factor and a root variable during the stratified period. The proposed statistical approaches might serve as powerful tools to explore the apparent relationships between trophic levels. The application of such analyses to comparisons of plankton associations in lakes of varying trophy may prove a useful avenue of research. (Humphreys-ISWS)
W80-05268

CRUSTACEAN ZOOPLANKTON OF LAKE SUPERIOR,
Canada Centre for Inland Waters, Burlington (Ontario).
N. H. F. Watson, and J. B. Wilson.
Journal of Great Lakes Research, Vol 4, No 3-4, p 481-496, December 1978. 9 Fig, 3 Tab, 25 Ref.

Descriptors: *Lake Superior, *Zooplankton, *Crustaceans, *Aquatic animals, Lakes, Surveys, Limnology, On-site investigations, Sampling, Copepods, Biomass, Spatial distribution, Data collections, Calanoids.

Six lakewide surveys were carried out on Lake Superior between May and November of 1973. The zooplankton population was found to be dominated by calanoids, and total abundance was generally low in comparison with the lower Great Lakes. Little variation was seen in total numbers/cu m through the sampling season, but total biomass increased fivefold between May and September. The lake appeared to support a permanent year-round lakewide community composed of Diacyclops bicuspidatus thomasi and the larger calanoid species. This community was augmented annually by a succession of summer forms which developed initially inshore and then spread to various degrees into the offshore waters. The zooplankton data were fitted to the fifteen zones defined by previous authors. This procedure showed the zooplankton community to be quite heterogeneous with greatest abundances being found in the inshore zones. Seasonal cycles of both numbers and biomass varied widely, but zone patterns could easily be grouped by general geographic area. The use of zone averages revealed a strong correlation between zooplankton biomass and surface water temperature. Cluster analysis was used to define independently regions of similar species composition. This procedure revealed that the zooplankton community was relatively homogeneous throughout the lake in the spring. Local clusters appeared in many inshore areas during the early summer, and by early fall the zooplankton community distribution was heterogeneous. Homogeneous conditions returned quickly with the late fall turnover. Most of the inshore regions occurred adjacent to areas of probable land-use effects. The life histories of selected major species were examined in cases where sampling and identification procedures permitted their analysis. (Humphreys-ISWS)
W80-05269

STATISTICAL EVALUATION OF THE RELATIONSHIPS BETWEEN PHYTOPLANKTON BIOMASS, CHLOROPHYLL A, AND PRIMARY PRODUCTION IN LAKE SUPERIOR,
Canada Centre for Inland Waters, Burlington (Ontario).
A. El-Shaarawi, and M. Munawar.
Journal of Great Lakes Research, Vol 4, No 3-4, p 443-455, December 1978. 5 Fig, 9 Tab, 17 Ref.

Descriptors: *Lake Superior, *Phytoplankton, *Chlorophyll, *Primary productivity, Statistical methods, Biomass, Spatial distribution, Temporal distribution, Regression analysis, Data processing, Analytical techniques, Lakes, Limnology.

Phytoplankton biomass, chlorophyll a, and primary production data collected during 1973 from Lake Superior were statistically analyzed using different regression techniques. The pattern of the spatial and temporal variabilities displayed by these parameters was determined. The analysis resulted in dividing the lake into three regions based on phytoplankton biomass and chlorophyll a, whereas two regions were found for primary production. The relationship between the biomass and chlorophyll a was highly significant, but the degree of significance varied by season. The variability in the chlorophyll a concentration was found closely related to the changes in the relative abundance of various taxonomic groups of phytoplankton. (Sims-ISWS)
W80-05270

PHYTOPLANKTON OF LAKE SUPERIOR 1973,
Canada Centre for Inland Waters, Burlington (Ontario).
M. Munawar, and I. F. Munawar.
Journal of Great Lakes Research, Vol 4, No 3-4, p 415-442, December 1978. 18 Fig, 8 Tab, 47 Ref.

Descriptors: *Phytoplankton, *Lake Superior, *Great Lakes, Biomass, Spatial distribution, Temperature, Water temperature, Diatoms, Dinoflagellates, Nannoplankton, Plankton, Aquatic microorganisms, Primary productivity, Nutrients, Lakes, Limnology, Cyanophyta, Chlorophyta, Cryptomonads, Chrysomonads, Phytoflagellates, Species composition.

The horizontal and vertical distribution of Lake Superior phytoplankton was studied from May to November/December 1973 at approximately monthly intervals from 34 stations distributed over the entire lake. Taxonomic identification and enumeration were carried out using the inverted microscope Utermoehl technique. The mean phytoplankton biomass showed a homogeneous distribution with very low biomass concentration across the lake (0.1-0.2 g/cu m). It did not show any inshore/offshore differentiation, although relatively high values were observed in the western end. On a lakewide basis the seasonal composition was dominated by the phytoflagellates (53%) and diatoms (38%), with the bluegreens and greens contributing the least. Among the phytoflagellates, Cryptophyceae (26%), Chrysophyceae (21%), and Dinophyceae (5%) were the main contributors. Lake Superior is characterized by a large number of species. Approximately 285 taxa were identified, the majority of which have not been reported before in Lake Superior or the other Laurentian Great Lakes. The offshore and open lake waters possessed large numbers of common species usually found in oligotrophic environments. However, the western end contained a limited number of common species, dominated by species of Melosira which are often associated with eutrophication. The offshore species succession revealed dominance of species usually found in oligotrophic waters. Several rare species were also identified. Some of them like Stelexmonas dichotoma Lackey and Chrysolykos planctonicus Mack were indicative of a cold-stenothermal oligotrophic environment. Vertical profiles exhibited three types of biomass-temperature relationships, one of which was the presence of a subthermocline maximum which appeared to be photosynthetically active. On the basis of biomass and species composition, Lake Superior was classified as an ultraoligotrophic environment similar to the deep, large, oligotrophic, boreal lakes. Lake Superior results, once again, emphasize the significance of phytoflagellates and nannoplankton in the algal dynamics of the Laurentian Great Lakes and demand the application of the standard Utermoehl technique in all phycological investigations. (Sims-ISWS)
W80-05271

SURFACE DISTRIBUTIONS OF AEROBIC HETEROTROPHS AND THEIR RELATIONSHIPS TO TEMPERATURE AND NUTRIENTS IN LAKE SUPERIOR DURING 1973,
Canada Centre for Inland Waters, Burlington (Ontario).
S. S. Rao.
Journal of Great Lakes Research, Vol 4, No 3-4, p 408-414, December 1978. 4 Fig, 2 Tab, 27 Ref.

Descriptors: *Lake Superior, *Aerobic bacteria, *Water pollution, Bacteria, Oligotrophy, Lakes, Distribution, Sampling, Analysis, Surfaces, Water quality, Nutrients, Water temperature, On-site investigations, Phosphorus, Ammonia, Spatial distribution, Nitrites, Nitrates, Heterotrophs.

The distribution and densities of aerobic heterotrophic bacteria were measured in the surface layers of Lake Superior from May to November 1973, and correlated with temperature and certain nutrient levels. On a lakewide basis bacterial densities were closely related to temperature, increasing from June until September, after which their levels started to decline. A similar relationship was noted in the nearshore areas of the lake until the September-October period, after which heterotroph densities increased despite the decrease in temperature (4C) in November. The importance of psychrophilic bacterial species in the nearshore areas of the lake and the relationships between heterotrophs and nutrients in the lake were discussed. (Humphreys-ISWS)
W80-05272

CHLORINATED ORGANIC RESIDUES IN FISH, WATER, AND PRECIPITATION FROM THE VICINITY OF ISLE ROYALE, LAKE SUPERIOR,
Environmental Research Lab.-Duluth, Grosse Ile, MI. Large Lakes Research Station.
W. R. Swain.
Journal of Great Lakes Research, Vol 4, No 3-4, p 398-407, December 1978. 2 Fig, 5 Tab, 11 Ref.

Descriptors: *Lake Superior, *Water pollution, *Air pollution, *Pesticide residues, Polychlorinated biphenyls, Fish, Precipitation(Atmospheric), Rainfall, Lakes, Organic compounds, DDE, Sampling, On-site investigations, Analysis, DDT, Data collections, Pesticides.

Studies of persistent organic contaminants for the Upper Lakes Reference Group of the International Joint Commission indicated increased levels of organic contamination in the flesh of fish taken from the vicinity of Isle Royale on Lake Superior. Significant increases in levels of organic residues in Lake Superior fish near Isle Royale were observed in lean lake trout, Salvelinus namaycush, and in fat lake trout, Salvelinus namaycush siscowet. Siskiwit Lake, a deep cold lake on Isle Royale, well removed from the direct influences of man, was selected as a control site for studies on Lake Superior. Values for several organic residues in the flesh of fish from Siskiwit Lake were significantly higher than corresponding fish from Lake Superior. Polychlorinated biphenyls were nearly double the Lake Superior mean value, and p, p-DDE showed a more than tenfold increase in Siskiwit

Lake. These findings lead to a preliminary study of the transport of polychlorinated biphenyl compounds in atmospheric precipitation. Data from the Isle Royale area were compared with metropolitan sites and with those of other investigators. (Humphreys-ISWS)
W80-05273

ORGANOCHLORINE SUBSTANCES IN LAKE SUPERIOR,
Canada Centre for Inland Waters, Burlington (Ontario).
W. M. J. Strachan, and G. E. Glass.
Journal of Great Lakes Research, Vol 4, No 3-4, p 389-397, December 1978. 2 Tab, 44 Ref.

Descriptors: *Lake Superior, *Water quality, *Reviews, *Pesticides, Chlorinated hydrocarbon pesticides, Polychlorinated biphenyls, DDT, Dieldrin, Endrin, Sediments, Fish, Organochlorine pesticides, Chlordane.

Published and governmental reports on Lake Superior were examined for accounts of the presence of polychlorinated biphenyls (PCBs), organochlorine pesticides (OCs), and other material in environmental samples of water, sediments, and fish. PCBs, DDT residues, and dieldrin were most often examined for and observed, although levels of hetachlor epoxide, chlordane, lindane, endrin, and a-BHC were determined infrequently and several chlorobenzenes and chloronorbornenes were found. Levels of PCBs and DDT often exceed International Joint Commission water quality objectives. An inability to compare most of the data was a major problem in assessing the data. (Humphreys-ISWS)
W80-05274

A COPPER ANOMALY IN WESTERN LAKE SUPERIOR,
Canada Center for Inland Waters, Burlington (Ontario).
N. D. Warry.
Journal of Great Lakes Research, Vol 4, No 3-4, p 386-388, December 1978. 2 Fig, 2 Tab, 17 Ref.

Descriptors: *Lake Superior, *Water quality, *Metals, Copper, Hydrogen ion concentration, Lakes, Surveys, On-site investigations, Data collections, Iron, Manganese, Nickel, Analysis, Methodology.

Elevated concentrations of soluble copper up to five times greater than 'normal' mean lakewide concentrations have been observed in the Duluth arm of Lake Superior in early spring. The concentration increase is attributable to abnormally high loading in the low pH spring meltwater coupled with a lack of water movement in this part of the lake. Unfortunately, it was not possible to determine what class of soluble metal was being detected. That is, it could not be determined whether the copper was present as a free metal ion, or was bound as some labile or nonlabile metal complex, or was present as an adsorbed species. As a result, no statement regarding the potential toxicity of the increased metal concentration can be made. (Humphreys-ISWS)

CHEMISTRY OF LAKE SUPERIOR,
Canada Centre for Inland Waters, Burlington (Ontario).
R. R. Weiler.
Journal of Great Lakes Research, Vol 4, No 3-4, p 370-385, December 1978. 9 Fig, 7 Tab, 23 Ref.

Descriptors: *Water quality, *Lake Superior, *Water chemistry, Spatial distribution, Temporal distribution, On-site investigations, Lakes, Alkalinity, Manganese, Conductivity, Metals, Ions, Copper, Zinc, Cobalt, Lead, Iron, Mercury, Cadmium, Chromium, Water temperature, Nutrients, Chlorides, Silica, Sampling, Phosphorus, Surveys, Hydrogen ion concentration, Analysis, Data collections, Nitrates, Sodium, Calcium, Magnesium, Sulfates, Potassium, Dissolved oxygen, *Trace metals.

This paper presents information on the distribution, both spatial and temporal, of major ions, trace metals, and nutrients in Lake Superior. The main source of information was the six cruises undertaken by the Canada Centre for Inland Waters in 1973, but earlier data from other sources were used to trace changes back to before 1900. It was concluded that essentially: (1) The concentration of major ions has remained constant since the beginning of the century. The quality and scarcity of data for the trace metals do not permit deductions to be made. Of the nutrients, only nitrate shows a clear trend, increasing at about 3 micrograms/L per year. (2) The waters of the lake are quite uniform both vertically and horizontally, except for the western end near Duluth. Well-defined seasonal cycles exist only for nitrates, silica, pH, and oxygen in the surface layer. These cycles are linked to the seasonal increase in plankton biomass. The geological, physical, and chemical factors that determine the chemistry of the lake were discussed, and it was concluded that Kramer's model of 1964 fits the data on major ion chemistry. In this model, the concentration of all ions, except chloride and sulfate, is determined by mixing rainwater with waters from tributaries that have reached equilibrium with minerals found in the surrounding rocks. The large discrepancies between calculated outflows and inflows of chloride, silica, total phosphorus, nitrogen, and dissolved solids, as well as the differences in the budgets calculated by different workers, suggest that a closer look has to be taken at the data and the calculations. The other possibility is that the recent concentrations in the lake are increasing slowly. (Humphreys-ISWS)

MAJOR ION LOADINGS TO LAKE SUPERIOR,
Canada Centre for Inland Waters, Burlington (Ontario).
M. E. Thompson.
Journal of Great Lakes Research, Vol 4, No 3-4, p 361-369, December 1978. 2 Fig, 6 Tab, 8 Ref.

Descriptors: *Water quality, *Hydrologic budget, *Ions, *Lake Superior, Hydrology, Precipitation(Atmospheric), Chemical precipitation, Forecasting, Cations, Anions, Calcium, Magnesium, Bicarbonates, Sulfates, Chlorides, Water chemistry, Data collections, Chemical reactions, Analytical techniques.

A method of predicting tributary loadings of major ions to Lake Superior was described, making use of the water budget and chemical composition of Lake Superior, and of data on the chemistry of atmospheric precipitation on or around the lake. Predicted tributary loading were compared with tributary water chemistry, and the basic assumptions of the procedure were confirmed: chemical weathering in the basin is the principal source of calcium, magnesium, and bicarbonate ions to the lake; the atmosphere is the major source of sulfate and chloride to the lake and to its basin. Both the predicted loadings and the river chemistry loadings estimates indicate an excess loading, mainly atmospheric in origin, of chloride and sulfate, but because the lake volume is so great, increases in concentrations of these ions in the open waters of the lake will not be detectable for several decades. (Humphreys-ISWS)

TURBIDITY DISPERSION IN LAKE SUPERIOR THROUGH USE OF LANDSAT DATA,
Minnesota Univ.-Duluth. Dept. of Physics.
V. Shuter, K. Stortz, G. Oman, and M. Sydor.
Journal of Great Lakes Research, Vol 4, No 3-4, p 359-360, December 1978. 2 Fig, 5 Ref.

Descriptors: *Lake Superior, *Turbidity, *Dispersion, *Remote sensing, Satellites(Artificial), Sediments, Suspended solids, Clays, Diffusivity, Winds, Mixing, Currents(Water), Water circulation, Lakes, Limnology.

Consecutive Landsat images of a red clay turbidity plume due to runoff from Nemadji River, Wisconsin, were used in computation of the horizontal eddy diffusivity for Lake Superior. Dispersion of turbid areas ranging from 2.5-5.4 km in diameter and having average velocities of 0.4 cm/sec-6.1 cm/sec were investigated. The coefficient for horizontal eddy diffusivity ranged from 0.6-1.5 sq m/sec. (Sims-ISWS)

WATER TRANSPARENCY OF LAKE SUPERIOR IN 1973,
Canada Centre for Inland Waters, Burlington (Ontario).
W. M. Schertzer, F. C. Elder, and J. Jerome.
Journal of Great Lakes Research, Vol 4, No 3-4, p 350-358, December 1978. 5 Fig, 2 Tab, 26 Ref.

Descriptors: *Lake Superior, *Turbidity, *Surveys, *Sampling, On-site investigations, Phytoplankton, Light, Water temperature, Depth, Chlorophyll, Lakes, Limnology, Extinction coefficients, Water transparency.

Measurements relating to water transparency were made at roughly monthly intervals during the period May through November 1973 on Lake Superior. Spectrometer data augmented with extensive transmissometer and Secchi disc observations at a grid of stations over the lake were used to compute mean vertical extinction coefficients and photic depth for photosynthetically active radiation in the wavelength band 400-500 nm. These permitted description of the temporal and spatial variability of photic conditions throughout the major photosynthetic production period. The data showed spatial and temporal variability in water transparency between areas and, for some zones, considerable departures from the lakewide mean were evident. The mean vertical extinction ranged from approximately 0.15 to 0.25/m for the majority of zones, and relatively good correspondence was observed with seasonal changes in chlorophyll a concentration. Considerably lower rates of light attenuation occurred in the deeper midlake zones. Photic zone depth in these areas characteristically ranged from 20 to 30 meters. Reduced water transparency generally predominated along coastal areas in the proximity of Duluth, Thunder Bay, the southwest red clay portions of the lake, Apostle Islands, Nipigon-Black Bay, Marathon, and Whitefish Bay. Photic zone depths in these areas were primarily less than 20 meters throughout the photosynthetic production period. In the vicinity of Duluth, mean photic depth values of less than 10 meters were observed with extreme minimums approaching 2 meters. (Sims-ISWS)

SIMULATION OF WATER CIRCULATIONS AND CHLORIDE TRANSPORTS IN LAKE SUPERIOR FOR SUMMER 1973,
Canada Centre for Inland Waters, Burlington (Ontario).
D. C. L. Lam.
Journal of Great Lakes Research, Vol 4, No 3-4, p 343-349, December 1978. 5 Fig, 16 Ref.

Descriptors: *Circulation, *Water circulation, *Chlorides, *Lake Superior, *Model studies, Mathematical models, Simulation analysis, Hydrodynamics, Mixing, Stratification, Currents(Water), Hypolimnion, Epilimnion, Pollutants, Path of pollutants, Dispersion, Upwelling, Lakes, Limnology, Chloride transport.

The mean water circulations of Lake Superior during June to September 1973, were obtained by hydrodynamical modeling. The time interval covered most of the stratification period during which the temperature data were adequately collected and analyzed. The computed results showed reasonable agreement with observed current meter readings. In particular, the generally counterclockwise circulation and some features of the Keweenaw current were obtained in the results. A computed map showing the frequent upwelling and downwelling zones was also given. These zones were often referred to in the description of the physical, chemical, and biological regimes of the lake. The computed currents provided adequate description of the advective transports during the period. By parameterizing the turbulent diffusion in an advection-diffusion model, it was

shown that the formulation proposed in previous studies appears to be also applicable for simulating the chloride transport in Lake Superior. Based on these studies, the mixing times of conservative materials were estimated to be about 2 to 3 years for Lake Superior depending on the location of the source. (Sims-ISWS)

WATER BUDGETS FOR LAKE SUPERIOR AND WHITEFISH BAY,
Canada Centre for Inland Waters, Burlington (Ontario).
E. B. Bennett.
Journal of Great Lakes Research, Vol 4, No 3-4, p 331-342, December 1978. 3 Fig, 5 Tab, 20 Ref.

Descriptors: *Hydrologic budget, *Precipitation(Atmospheric), *Watersheds(Basins), *Lake Superior, Rainfall, Evaporation, Hydrologic cycle, Hydrology, Water storage, Lakes, Bays, Water loss, Monthly, Data collections, Phosphorus, Networks, Runoff, Surface runoff, *Whitefish Bay(MI).

Average monthly and annual water budgets were presented for Lake Superior and for Whitefish Bay, through which water flows from the lake to discharge in St. Mary's River. Annual over-lake rainfall, estimated from monthly maps, is 93% of precipitation rate on land but accounts for 51.5% of the total input of water. Land drainage to the lake calculated from river discharge data is 7.5% higher than a previous estimate based on surface runoff. Estimates of evaporation from the lake surface, determined as the residual in the water balance, differ significantly from estimates derived by mass transfer techniques during early summer when the over-lake atmospheric boundary layer is very stable. Evaporation is the smallest term in the annual water budget, but is more than half of St. Mary's River discharge, the largest term. Diversions of water to Lake Superior have increased the mean rate of St. Mary's River discharge from 2136 to 2297 cu m/s. Relatively high rainfall and land drainage to Whitefish Bay result in reduction of flow from the main body of Lake Superior, and in principle cause a significant difference between the concentration of a material in the water of Lake Superior and that of water entering St. Mary's River. Lake Superior has the longest flushing time (177 years) among the Great Lakes, and thus concentrations of conservative materials in the lake are most sensitive to changes in loading rates and require the longest time to adjust to a change in loading. CHARACTERISTICS OF THE THERMAL REGIME OF LAKE SUPERIOR,
Canada Centre for Inland Waters, Burlington (Ontario).
E. B. Bennett.
Journal of Great Lakes Research, Vol 4, No 3-4, p 310-319, December 1978. 10 Fig, 1 Tab, 9 Ref.

Descriptors: *Lake Superior, *Great Lakes, *Water temperature, *Heat, Lakes, Temperature, Water circulation, Stratification, Stability, Upwelling, Dissolved oxygen, Surveys, Sampling, Limnology, Thermal regime.

Among the Great Lakes, Lake Superior has the lowest summer surface temperature and mean annual lake temperature, but has the highest spring and annual heat incomes per unit area. These characteristics are associated with the large depth and width of the lake, and with relatively long periods of extensive vertical mixing during spring and fall, and short intervening periods of stratification. The thermal regime has a strong observed influence on seasonal cycles in the vertical and horizontal distribution of currents, and in turn is influenced by coastal and midlake upwelling. (Sims-ISWS)

ENVIRONMENTAL CLIMATOLOGY OF LAKE SUPERIOR,
Atmospheric Environment Service, Downsview (Ontario).
D. W. Phillips.
Journal of Great Lakes Research, Vol 4, No 3-4, p 288-309, December 1978. 16 Fig, 7 Tab, 17 Ref.

Descriptors: *Lake Superior, *Great Lakes, *Climatology, *Lakes, Topography, Water temperature, Stability, Precipitation(Atmospheric), Winds, Waves(Water), Fog, Humidity, Ice cover, Air pollution, Climates, Weather, Meteorology, Limnology.

Among the variety of local controls which shape the climate of the Lake Superior region, the presence of the lake itself with its large surface area and great depth is by far the most important. Climatological influences are not just confined to the immediate vicinity of the lake but are spread downwind in all directions over the entire Great Lakes system--intensifying storms, moderating temperatures, augmenting and suppressing precipitation and cloud cover, enhancing wind speeds, generating waves, etc. The annual range of surface water temperature rarely exceeds 10C. Differences in temperature between the surface water and the over-riding air are very high and positive from May through August. Consequently, occurrences of fog, pollution stagnation, and condensation are frequent during the warming period. Light, persistent winds are much less frequent over Lake Superior compared to land stations, and there is a predominant local circulation from lake to land during daytime and a reversed flow at night. The effect of the climate on the potential quality of the air-water environment is much in evidence. Even upper air stations have registered the importance of Lake Superior on mixing heights and ventilation coefficients. In recent years it has become evident that atmospheric input of sulfate to the Great Lakes is now believed to be a significant portion of the sulfate pollution of the lakes. (Sims-ISWS)

SEDIMENTATION RATES AND A SEDIMENT BUDGET FOR LAKE SUPERIOR,
Canada Centre for Inland Waters, Burlington (Ontario).
A. L. W. Kemp, C. I. Dell, and N. S. Harper.
Journal of Great Lakes Research, Vol 4, No 3-4, p 276-287, December 1978. 4 Fig, 4 Tab, 36 Ref.

Descriptors: *Sedimentation rates, *Lake Superior, *Wisconsin, *Sediment distribution, Lakes, Deposition(Sediments), Sediments, On-site investigations, Bank erosion, Pollen, Rivers, Surveys, Sampling, Clays, Sands, Iron, Silts, Beach erosion, Analysis, Sediment budget, Organic carbon, Ambrosia horizon.

Present-day sedimentation rates were determined at ten offshore locations, representative of the depositional basins in Lake Superior. Sedimentation rates were calculated by averaging the weight of sediment deposited above the Ambrosia pollen horizon, dated at 1890. The rates are variable ranging from a low of 25 g/sq m/yr to a maximum value of 780 g/sq m/yr. Sedimentation rates were related to the proximity of terrestrial source, circulation patterns, and bottom topography. The highest rates were found at locations closest to the edges of the depositional basins and at the base of steep-sided troughs. The present-day sedimentation rates were proportional to the postglacial sedimentation rates at almost every locality and were half the value of the postglacial rates. A total of 6.029 million tons of fine-grained sediment is annually deposited in the lake. Erosion of the red clay bluffs of Wisconsin is the major sediment source accounting for up to 58% of the external input. Rivers contribute 30% of the external sediment load. It is calculated that the Duluth basin is the repository of 37% of the total present-day natural sediment loading to the lake. (Humphreys-ISWS)

SEDIMENTS OF LAKE SUPERIOR,
Canada Centre for Inland Waters, Burlington (Ontario).
R. L. Thomas, and C. I. Dell.
Journal of Great Lakes Research, Vol 4, No 3-4, p 264-275, December 1978. 9 Fig, 2 Tab, 37 Ref.

Descriptors: *Lake Superior, *Sediments, *Surveys, Sampling, Geology, Glacial sediments, Bottom sediments, Bathymetry, Particle size, Chemistry, Carbon, Data processing, Lakes, Sedimentology, Limnology, Lake sediments.

Samples (406) were taken of the surficial 3 cm of sediment from Lake Superior in 1973. A description of these samples together with the interpretation of continuous echosounding records resulted in a description of the surface sediment distribution which was interpreted in the light of the glacial and postglacial evolution of the lake basin. Samples were analyzed for grain size, Eh, pH, organic and inorganic carbon. These parameters were described and related to the modern depositional environment. Eh, pH, and organic carbon reflected the current nature of the lake as being oxic and oligotrophic with low primary productivity. Grain size parameters showed distributional trends related to water depth indicating progradation from coarse to fine materials as a function of increasing water depth. (Sims-ISWS)

LAKE SUPERIOR BASIN AND ITS DEVELOPMENT,
Canada Centre for Inland Waters, Burlington (Ontario).
D. H. Matheson, and M. Munawar.
Journal of Great Lakes Research, Vol 4, No 3-4, p 249-263, December 1978. 8 Fig, 1 Tab, 47 Ref.

Descriptors: *Lake Superior, *Great Lakes, *Lakes, *Reviews, Water quality, Water temperature, Physical properties, Water balance, Hydrology, Circulation, Water circulation, Water chemistry, Biological communities, Pollutants, Water pollution, Nutrients, Sediments, Trace elements, Metals, Asbestos, Precipitation(Atmospheric), Limnology.

Lake Superior is unique in having the largest surface area of any freshwater lake in the world; in volume it is second only to Lake Baikal. Its location on the edge of the Canadian Shield, in a rugged land and in a northern climate, has delayed and limited the cultural development of the basin. Natural loadings to the lake are small since the bedrock is resistant to weathering; man-made pollution is slight because of the low population density in the watershed. The lake surface occupies more than one-third of the basin area with the result that direct precipitation on the lake surface is the major source of water input. Atmospheric transport is considered to be one of the most important sources of chemical loadings, the ultimate origin of which may be quite remote from the watershed. The present state of our knowledge about the Lake Superior basin was reviewed from several points of view which include the historical, geological, physical, chemical, and biological aspects. It was apparent that the influence of man-made pollution has not yet affected the lakewide water quality, and most of the lake remains in a largely unaltered oligotrophic condition. In 1972 the two bordering countries, Canada and the United States, entered into an agreement aimed at preserving this major resource. During 1976 the International Joint Commission received a report which described the baseline water quality conditions of the lake. This report provided much of the information on which managerial practices in the basin will be based during the next decade. (Sims-ISWS)

HYDROLOGICAL FEATURES OF A CALIFORNIA COASTAL FEN,
California Univ., Berkeley. Dept. of Forestry and Conservation.
D. C. Erman, K. B. Roby, and M. Eames.
Great Basin Naturalist, Vol 37, No 1, p 57-66, March, 1977. 5 Fig, 3 Tab, 16 Ref.

Descriptors: *Fen, *California, *Hydrologic aspects, Wetlands, Peat, Marshes, Sediments, Magnesium, Calcium, Streamflow.

A 38.6 ha fen on the California coast depends on six streams for its supply of flowing, mineral-rich water. About 25% of the water is supplied by surface streams that had average concentrations of 0.15-0.32 meq Ca(2+)/l and 0.25-0.47 meq Mg(2+)/l. During the dry summer period, oxygen concentrations and pH were lower in the central fen area than in the margins. Water flow near the margins supports high 02, pH, and cation content levels. The fen ranges from 4 to over 11 m in depth, with the thickest peat layer being made up of very liquid, unconsolidated peat. In one year, an estimated 19.3 metric tons of suspended sediments entered the fen, which was equivalent to a 42 kg/ha loss from the total watershed. (Steiner-Mass)

PHOTOSYNTHETICALLY ACTIVE RADIATION IN A STAND OF PHRAGMITES COMMUNIS TRIN. IV. STOCHASTIC MODEL,
Ceskoslovenska Akademie Ved, Trebon. Dept. of Hydrobotany.
J. P. Ondok.
Photosynthetica, Vol 9, No 2, p 201-210, 1975. 7 Fig, 1 Tab, 1 Append.

Descriptors: *Marsh plants, *Model studies, *Energy conversion, Wetlands, Photosynthesis, Light intensity, Plant physiology, Primary productivity.

The model inputs are the hourly sums of photosynthetically active radiation (PhAR). Its daily and seasonal course is simulated using distributions derived from previously recorded data. Two submodels (one for direct and the other for diffuse sky radiation) are introduced, each containing three compartments: PhAR intercepted by foliage, PhAR intercepted by water below the reed canopy, and PhAR reflected to the atmosphere by both the foliage and water. The daily course of radiant energy content in these compartments is simulated: the result is the regime of PhAR in a reed stand during the whole growing season. The course of radiation reaching the top of a stand canopy can be fitted to a smooth curve only under clear sky conditions. In natural weather conditions, this course is irregular and involves rapid changes due to clouds. These changes have a stochastic character: by relating them to a time scale, empirical distributions of irradiance are obtained. The actual daily course of irradiance may be simulated on the basis of distributions fitted to the empirical distributions by the generating process. In the model, hourly values of irradiance were chosen as the first approximation to the reality, but the model is not restricted to this selected scale and may be easily applied to any other time scale. PETROGRAPHY AND PALEOECOLOGY OF HOLOCENE PEATS FROM THE OKEFENOKEE SWAMP-MARSH COMPLEX OF GEORGIA,
Southern Illinois Univ., Carbondale. Dept. of Geology.
A. D. Cohen.
Journal of Sedimentary Petrology, Vol 44, No 3, p 716-726, September, 1974. 12 Fig, 18 Ref.

Descriptors: *Swamps, *Georgia, *History, Wetlands, Marshes, Marsh plants, Peat, Palynology, Burnings.

The Okefenokee Swamp, a paludal region of over 400,000 acres is developed upon a terrace which was formerly a Pleistocene marine lagoon separated from the open ocean by a long barrier island. The lack of any salt tolerant plants in the peat at the contact with the sandy substrate suggests that some considerable length of time occurred after withdrawal of the sea and before production of the first peats. Also, the fact that the first-formed peat in all cases was a highly oxidized deposit containing residual siliceous material indicates that some thickness of previously deposited peat may have been destroyed before the onset of modern peat deposition. Palaeobotanical analyses of cores from the three largest marshes reveal that these areas have not changed greatly in vegetational and depositional environment from the beginning. In addition, the present positions of these marshes seems to be controlled by the positions or pre-peat topographic lows. Their vegetational continuity to the present day is probably related to: (1) a continuous, uniform rise in water levels, (2) the common occurrence of fires in the Okefenokee, and (3) the consistently greater depths of peat in these regions. THE INFLUENCE OF THICK FLOATING VEGETATION (WATER HYACINTH: EICHHORNIA CRASSIPES) ON THE PHYSICO-CHEMICAL ENVIRONMENT OF A FRESH WATER WETLAND,
Bhagalpur Univ. (India). Ecology Research Lab.
D. N. Rai, and J. D. Munshi.
Hydrobiologia, Vol 62, No 1, p 65-69, 1979. 5 Fig, 1 Tab, 8 Ref.

Descriptors: *Vegetation effects, *Water hyacinth, *Microenvironment, Wetlands, Marsh plants, Aquatic plants, Floating plants, Dissolved oxygen, Water temperature, Freshwater marshes.

Dissolved 02 was generally lower, dissolved carbon dioxide higher, pH lower, and temperature fluctuations lower under areas covered by water hyacinth than in open water areas. The extent of the difference was found to be dependent upon the time of day and season. Due to extreme hypercarbic and hypoxic conditions, mostly air breathers and supplemental air breathers were found living under the hyacinth mat. Reasons for the higher carbon dioxide and lower 02 levels were the high anaerobic decomposition rate of the mat's detritus, increased respiratory activities of organisms, and decreased photosynthesis rate due to the shadowing effect of Eichhornia crops over the water surface. FUNGI ASSOCIATED WITH THE ROOTS OF RED MANGROVE, RHIZOPHORA MANGLE,
Hawaii Univ., Honolulu. Dept. of Botany.
B. K. H. Lee, and G. E. Baker.
Mycologia, Vol 65, p 894-906, 1973. 1 Fig, 4 Tab, 33 Ref.

Descriptors: *Mangrove swamps, *Soil fungi, *Rhizosphere, Wetlands, Swamps, Fungi, Marine fungi, Distribution patterns, Soil microorganisms, Root zone, Hawaii.

The microbial communities of root-free soil, the rhizosphere, and the rhizoplane of a red mangrove swamp in Hawaii were studied. There was a pronounced rhizosphere effect with greater numbers of bacteria, actinomycetes, and fungi occurring at all salinity levels in the rhizosphere soil than in the root-free soil at corresponding salinity levels. Primarily the microfungi isolated from the rhizoplane were known root-surface or root-tissue fungi. In the rhizosphere community, Fungi Imperfecti contributed 87.9% of the species. Phycomycetes and Ascomycetes comprised the balance. No Phycomycetes were recovered from the rhizoplane. Ascomycetes were isolated in the rhizosphere, the rhizoplane, live roots above the tidal line, and dead roots below the tidal line. Basidiomycetes and Myxomycetes were found only on live prop roots above the tidal line. Eight species of Fungi Imperfecti were predominant in the rhizosphere and rhizoplane. (Steiner-Mass)

AIRBORNE MULTISPECTRAL SURVEY OF INTERTIDAL VEGETATION IN ALASKA,
Environmental Research Inst. of Michigan, Ann Arbor.
F. C. Polcyn, N. E. G. Roller, S. Zimmerman, and J. Gnagy.
International Symposium of Remote Sensing of the Environment, Vol 12, p 1091-1102, 1978. 9 Fig, 3 Tab.

Descriptors: *Intertidal zone, *Marine algae, *Remote sensing, Aerial photography, Distribution patterns, Spatial distribution, Alaska, Surveys, Shores.

Digital analysis was performed on a set of multispectral data collected by a low-flying aircraft at study sites in the Gulf of Alaska for the purpose of mapping intertidal algal communities. Both supervised and unsupervised pattern recognition procedures were employed. Results show that it is possible to separate a scene into (1) broad spatial zones corresponding to vegetation density for areas of low percent cover and (2) algae types according to their taxonomic division (green, blue green, red, etc.) for areas with high levels of percent cover. Clustering techniques were found to be the most effective way to extract training signatures. A minimum of four spectral bands is needed to achieve the recognition performance levels demonstrated in this study. Two channels in the visible (green and red), one in the near-infrared region ('APPROX.' 1.0 m) and one in the thermal region were found most useful. (Steiner-Mass)

SIMPLE MODELS FOR CALCULATING EVAPORATION FROM DRY AND WET TUNDRA SURFACES,
Atmospheric Environment Service, Downsview (Ontario). Hydrometeorological and Environmental Impact Div.
R. B. Stewart, and W. R. Rouse.
Arctic and Alpine Research, Vol 8, No 3, p 263-274, 1976. 8 Fig, 1 Tab, 21 Ref.

Descriptors: *Evaporation, *Arctic, *Tundra, Energy budget, Model studies, Solar radiation, Air temperature, Canada, Hudson Bay lowlands.

Energy-budget calculations and equilibrium evaporation estimates from a well-drained lichen-dominated raised beach ridge and a wet sedge meadow in the Hudson Bay lowlands are presented. Energy-budget calculations reveal that on the average 54 and 66% of the daily net radiation are utilized in the evaporative process over a ridge and sedge meadow surface, respectively. For the ridge, half-hourly and daily values of evaporation were approximated closely by equilibrium estimates, while for the sedge meadow, close approximation was achieved by a model where the ratio of actual to equilibrium evaporation equals 1.26. A simple model, expressed in terms of incoming solar radiation and air temperature is developed for each surface from the comparison of actual and equilibrium evaporation. Tests of the models at different locations indicate that the actual evaporation can be estimated on a daily basis within 10% for dry upland and saturated sedge meadow surfaces. (Steiner-Mass)

VEGETATIONAL DEVELOPMENT AND THE EFFECT OF GEESE ON VEGETATION AT LA PEROUSE BAY, MANITOBA,
Toronto Univ. (Ontario). Dept. of Botany.
R. L. Jefferies, A. Jensen, and K. F. Abraham.
Canadian Journal of Botany, Vol 57, No 13, p 1439-1450, 1979. 6 Fig, 4 Tab, 40 Ref.

Descriptors: *Salt marshes, *Marsh plants, *Snow geese, Wetlands, Wildlife, Marshes, Arctic, Grasses, Waterfowl, Vegetation regrowth, Distribution patterns, Damages, Vegetation effects, Plant growth, Canada, La Perouse Bay(Manitoba).

The unconsolidated, water saturated sediments of the La Perouse Bay salt marshes are colonized by Hippuris tetraphylla, Puccinellia phryganodes, and Carex subspathacea. These sediments undergo frost heave, and on elevated mounds, Elymus arenarius and Salix brachycarpa become established. Where drainage is impeded in the upper marsh, relatively high salinities occur and species such as Salicornia europaea and Triglochin maritima are present. A population of 10,000-20,000 lesser snow geese feed in summer on P. phryganodes, C. subspathacea, Potentilla egedei, and E. Arenarius. The birds strip the shallow turf of P. phryganodes in low-lying areas between clumps of willow. This terracing of the surface creates depressions which become filled with water and ice. The role of geese in producing these ponds in the upper levels of salt marshes in the actic does not appear to have been reported previously. The ponds are subsequently colonized by Carex aquatilis and Triglochin maritima. The salt marsh gives way to extensive freshwater marsh dominated by species of Salix, Eriophorum augustifolium, Calamagrostis neglecta, and Dupontia fisheri. (Steiner-Mass)

THE LITTORAL VEGETATION OF NORDBYTJERNET, A SMALL LAKE IN SOUTH-EAST NORWAY,
Oslo Univ. (Norway). Dept. of Marine Biology and Limnology.
D. Hongve.
Norwegian Journal of Botany, Vol 22, p 83-97, 1975. 8 Fig, 4 Tab, 17 Ref.

Descriptors: *Littoral, *Aquatic plants, *Lakes, Rooted aquatic plants, Distribution patterns, Water levels, Norway, Nordbytjernet(Norway).

In the epilittoral, the two main phytocoenoses were dominated by Carex rostrata and Calamagrostis canescens. Among the hydrophytes, three life forms dominated; namely, helophytes, nymphaeids, and elodeids. The elodeid vegetation was especially rich. The hydrophyte species were found to intermingle, and no clearly defined zones of different life forms with increasing depth were discernible, probably because of the relatively steep slope of the shore inhabited by the plants. GROWTH, CHLOROPHYLL AND MINERAL NUTRIENT STUDIES ON PHALARIS ARUNDINACEAE L. IN THREE SCOTTISH LOCHS,
Dundee Univ. (Scotland). Dept. of Biological Sciences.
Y. B. Ho.
Hydrobiologia, Vol 63, No 1, p 33-43, 1979. 11 Fig, 6 Tab, 15 Ref.

Descriptors: *Mineral requirements, *Chlorophyll, *Plant growth, *Marsh plants, Wetlands, Marshes, Temporal distribution, Carbon, Nitrogen, Phosphorus, Potassium, Sodium, Calcium, Magnesium, Iron, Scotland, Loch of the Lowes, Forfar Loch, Balgavies Loch.

Growth, chlorophyll and mineral nutrients studies were made in Phalaris arundinaceae L. in three Scottish lochs of varying nutrient status from March to November in 1975. The maximum shoot height and shoot dry weight attained by the plants were approximately 160 cm and 4 g respectively. Seasonal changes in the chlorophyll levels in the Phalaris leaf were studied and two peaks were found, one in April and the other in June-July. Maximum chlorophyll level attained was 9 mg g(-1) leaf dry weight. The changes in the mineral levels in the root, stem, leaf and inflorescence parts of the plants from the three lochs were also assayed throughout the growing season. A total of eight mineral elements were studied, including carbon, nitrogen, phosphorus, potassium, sodium, calcium, magnesium and iron. Variations in both the mineral concentrations and their pattern of changes during the study period among the plants from the lochs were observed and discussed. (Steiner-Mass)

BIOGENIC SEDIMENTARY STRUCTURES PRODUCED BY CRABS IN LAGOON MARGIN AND SALT MARSH ENVIRONMENTS NEAR BEAUFORT, NORTH CAROLINA,
Mount Holyoke Coll., South Hadley, MA. Dept. of Geology.
E. A. Allen, and H. A. Curran.
Journal of Sedimentary Petrology, Vol. 44, No. 2, p 538-548, June, 1974. 5 Fig, 2 Tab, 20 Ref.

Descriptors: *Crabs, *Burrows, *Salt marshes, *Beach, *North Carolina, Wetlands, Habitats, Aquatic animals, Marshes, Deposition(Sediments), History, Intertidal areas, Distribution patterns.

Intertidal burrowing crabs produce distinctive biogenic sedimentary structures in protected lagoon margin and salt marsh evnironments. Distribution of crabs is determined primarily by substrate characteristics, salinity, and vegetation cover in the intertidal zone. Protected sand beaches and flat are heavily utilized by the sand fiddler, Uca pugilator, while backshore and foredune ridges above the high tide line are used by the ghost crab, Ocypode quadrata. Salt marshes influenced by normal to near normal salinities are burrowed by U. pugilator, Uca pugnax, and Sesarma reticulatum. U. pugnax and S. reticulatum burrow in muddy substrate areas, particularly along tidal creek banks, whereas U. pugilator is restricted to sandy substrate areas. In salt marshes where the influence of freshwater is great, Uca minax and U. pugnax are the dominant crabs. Intertidal crabs are important agents of bioturbation in the environments that they inhabit. Their burrows have excellent potential for preservation in the sedimentary record. Recognition of the record of biogenic sedimentary structures produced by intertidal crabs would be of significant value in identifying paleoenvironments, fixing ancient lagoon margin and estuarine shorelines, and determining paleosalinities. EXPERIMENTAL DEGRADATION OF DETRITUS MADE FROM THE SALT MARSH PLANTS SPARTINA ALTERNIFLORA LOISEL., SALICORNIA VIRGINICA L., AND JUNCUS ROEMERIANUS SCHEELE,
Georgia Univ., Sapelo Island. Marine Inst.
E. B. Haines, and R. B. Hanson.
Journal of Experimental Marine Biology and Ecology, Vol. 40, p 27-40, 1979. 2 Fig, 3 Tab, 20 Ref.

Descriptors: *Marsh plants, *Degradation(Decomposition), *Efficiencies, *Detritus, Wetlands, Rates, Salt marshes, Deterioration, Marshes, Decomposing organic matter, Georgia, Sapelo Island area(GA).

The pattern of decomposition and potential food value of detritus derived from the C4 photosynthetic pathway plant Spartina alterniflora and the C3 pathway plants Salicornia virginica and Juncus roemerianus were compared. The most rapid decreases in ash-free dry weight and increases in microbial biomass were under aerobic conditions with added nitrogen. Material in aerobic treatments without added nitrogen degraded only slightly faster than in anaerobic treatments. The dissolved organic carbon (DOC) in the cultures was < 5% of the total detrital carbon; the DOC content decreased during the firt week, most rapidly in the aerobic cultures, and then began to increase slowly. Rates of nitrogen fixation in the cultures were low, and were depressed by the pressure of O2 and NH4(+), and by a higher nitrogen content of the detritus. Salicornia detritus initially degraded the fastest but showed the lowest conversion efficiency of plant material to microbial biomass (19.4%). Spartina detritus had the highest conversion efficiency (64.3%), while Juncus, which decomposed most slowly, had a conversion efficiency of 55.6%. From 87% to 100% of the increase in nitrogen content of the plant detritus is ascribed to protein-nitrogen. (Steiner-Mass)

ACCUMULATION OF TIN BY MANGROVE SPECIES IN WEST MALAYSIA,
Westfield Coll., London (England). Dept. of Botany and Biochemistry.
P. J. Peterson, M.A.S. Burton, M. Gregson, S. M. Nye, and E. K. Porter.
Science of the Total Environment, Vol. 11, p 213-221, 1979. 1 Fig, 5 Tab, 30 Ref.

Descriptors: *Mangrove swamps, *Metals, *Bioindicators, Wetlands, Plant physiology, Detritus, Swamps, Bioassay, Leaves, Iron, Copper, Zinc, Malaysia, Tin.

Concentrations of tin, iron, copper, and zinc were determined in the leaves of the mangrove species at various sites in West Malaysia in an analysis of the use of such plants as biogeochemical indicators. Results show that the concentrations of all the metals were higher in the leaves than in the twigs, but, whereas the concentration of tin was higher in the old leaves, that of the other three elements was higher in young leaves. A comparison of the metal concentration between Acanthus illicifolius and Rhizophora conjugata reveals that tin and iron are comparable, but zinc and copper are markedly higher in the former. A comparison of the detrital and the mangrove leaves metal concentrations reveals that a considerable increase in metal concentration has taken place in the detritus. Whether these encrichments represent selective adsorption and chemical complexation by decaying leaves or whether they illustrate accumulation by microorganisms requires further studies. Despite the complexity of mangrove ecosystems, results indicate that mangroves could be used to advantage for biogeochemical prospecting and for locating elevated metal levels resulting from pollution. IDENTIFICATION OF PLANT FRAGMENTS AND POLLEN FROM PEAT DEPOSITS IN RANGITAIKI PLAINS AND MAKETU BASINS,
Massey Univ., Palmerston North (New Zealand). Dept. of Botany.
E. O. Campbell, J. C. Heine, and W. A. Pullar.
New Zealand Journal of Botany. Vol. 11, No. 2, 317-330, June 1973. 3 Fig, 1 Tab, 2 Ref, 1 Append.

Descriptors: *History, *Bogs, *New Zealand, Wetlands, Peat, Palyrology, Succession, Marsh plants, Spores, Pollen Soil-water-plant relationships.

From a study of plant remains (mainly roots), pollen, and fern spores preserved in the peat, it is

possible to construct a picture of the past vegetation in the bog areas on the Rangitaiki plains, New Zealand. The peat, for the most part, was a sedge peat which had developed in low moor bogs with Baumea complanata as the main peat former. There would be free water around the Beaumea clumps and around the taller clumps of Cortaderia which is often present. There were drier periods when Gleichemia, Leptospermum, Dacrycarpus, Laurelia, and associated plants tended to establish and wetter periods when the restiads (Calorophus and Sporadanthus), indicative of a raised bog, came in (Steiner-Mass)

ENVIRONMENTAL FACTORS IN RELATION TO THE SALT CONTENT OF SALICORNIA PACIFICA VAR. UTAHENSIS,
Brigham Young Univ., Provo, UT. Dept. of Botany.
D. J. Hansen, and D. J. Weber.
Great Basin Naturalist, Vol 35, No 1, p 86-96, March, 1975. 16 Fig, 2 Tab, 30 Ref.

Descriptors: *Plant physiology, *Salinity, *Halophytes, Wetlands, Plant growth, Salt marshes, Environmental effects, Marsh plants.

The stability of the salt content in Salicornia pacifica Standl. var. utahensis (Tidestrom) Munz in relation to environmental changes was investigated. Salicornia pacifica communities have a characteristic soil pH of 7.5 to 8.0 + or - 0.2 and a constant subsurface soil moisture level of 25 to 35 percent. The ion content in the tissue of S. pacifica remained constant despite increased moisture stress throughout the growing season. The concentrations of the salts were significantly higher in the surface soil layers than in the subsurface layers around the roots. Normal metabolic processes in the tissues of S. pacifica appear to occur even though some fluctuations in the ionic balance and concentration of ions in the plant occur. (Steiner-Mass)

2J. Erosion and Sedimentation

MODEL PREDICTIONS OF EFFECTS OF IMPOUNDMENT ON PARTICULATE ORGANIC MATTER TRANSPORT IN A RIVER SYSTEM,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
J. R. Webster, E. F. Benfield, and J. Cairns.
In: The Ecology of Regulated Streams, p 339-364, 1979, Plenum Publishing Corporation. 4 Fig, 1 Tab, 78 Ref.

Descriptors: *Suspended solids, *Suspended load, *Organic matter, *Impoundments, *Model studies, Simulation analysis, Sedimentation, Sediment transport, Reservoirs, Particle size, Leaves, Hydroelectric plants, Erosion, Mathematical studies, Headwaters, Upstream, Standing crops, Seston, *Particulate organic matter transport.

Three empirical equations relating elevation, stream width, and mean annual stream flow to distance were used in a model of the effects of impoundment on particulate organic matter (POM) dynamics in a river-reservoir ecosystem. The model considers the entire river system above an impoundment and for a distance downstream. Data needed to numerically parameterize the model were taken from the New River and Claytor Lake in North Carolina and Virginia. The river goes from first to sixth order and is impacted by impoundment, industrial and urban effluents, and agricultural runoff. The impoundment, a hydroelectric power dam, is located 290 km below the headwaters. Equations are presented for hydraulic parameters, reservoir parameters, biological parameters, and sedimentation and erosion. A 14-month simulation identified several areas where the model does not accurately reflect actual POM behavior including: the seasonality of allochthonous inputs, autochthonous sources of POM, filter-feeder use of POM, and deposition and resuspension of POM. Simulation results did show that POM concentration was highest during leaf fall; during leaf fall POM concentration peaked a short distance downstream from the headwaters; benthic POM was greatest just after leaf fall; and there was a consistent downstream decrease in POM standing crop. Changes occurring within and below the impoundment were also discussed. (Seigler-IPA)

POINT BAR AND FLOODPLAIN FORMATION OF THE MEANDERING BEATTON RIVER, NORTHEASTERN BRITISH COLUMBIA, CANADA,
Wollongong Univ. (Australia). Dept. of Geography.
G. C. Nanson.
Sedimentology, Vol 27, No 1, p 3-29, February 1980. 25 Fig, 1 Tab, 53 Ref.

Descriptors: *Flood plains, *Sedimentology, *Channel morphology, *Canada, On-site investigations, Meandering, Rivers, Stratigraphy, Particle size, Sediments, Velocity, Distribution patterns, Alluvial channels, Deposition(Channels), Sediment transport, Currents(Water), Beatton River(British Columbia), Point bars, Scroll bars, Secondary currents.

This study examined the morphology, sedimentology, and genesis of the point bars and floodplain of the Beatton River. The Beatton River, a 500 km tributary of the Peace River, drains an area of 16,070 sq km near Fort St. John, northeastern British Columbia, Canada. The formation of point bass occurs in distinct stages. An initial point bar platform composed mainly of coarse sediment is formed adjacent to the convex bank of a migrating meander bend and is the base on which develops a single scroll bar of fine traction and suspended load. With continued sedimentation, the scroll bar grows, eventually supporting vegetation and becoming a floodplain ridge. Scroll bars form with greatest size and frequency in rapidly migrating bends, and the shape of the meander bend appears to determine both the location of the initial bar deposit and its direction of growth up or downstream. Approximately one-half of the floodplain sediment is derived from suspended load, and the initiation of a scroll bar appears to be due to excessive deposition of suspended load in a zone of flow separation over a point bar platform. The critical flow condition for the initiation of a scroll bar does not occur with the same recurrence interval on different shaped meander bends, however, the average recurrence interval within the study reach is approximately every 30 years. Sedimentation rates on point bars and on the floodplain indicate two relatively distinct stages of floodplain alluviation. The most rapid is for surfaces less than 50 years old, although sediment accumulation still persists on surfaces up to 250 years in age. Although frequently flooded, surfaces older than this accumulate very little sediment. Despite 2-3 m of overbank deposition, the amplitude of floodplain ridges is maintained by secondary currents which sweep sediment from the swales towards the ridge crests. (Humphreys-ISWS)

A PHYSICAL MODEL FOR THE TRANSPORT AND SORTING OF FINE-GRAINED SEDIMENT BY TURBIDITY CURRENTS,
Dalhousie Univ., Halifax (Nova Scotia).
D. A. V. Stow, and A. J. Bowen.
Sedimentology, Vol 27, No 1, p 31-46, February 1980. 11 Fig, 2 Tab, 87 Ref.

Descriptors: *Sediment transport, *Sediment sorting, *Turbidity currents, *Model studies, Sedimentation, Density currents, Turbidity, Deposition(Sediments), Rates, Clays, Silts, Analytical techniques, Particle size, On-site investigations, Mathematical models.

Turbidite muds in cores from the outer Scotian continental margin, off eastern Canada, contain abundant thin silt laminae. Graded laminated units are recognized in parts of this sequence. These represent single depositional events and show a regular decrease in modal grain size and thickness of the silt laminae through the unit. A similar fining trend is shown by both silt and mud layers over hundreds of kilometers downslope. Textural analysis of individual laminae allows the construction of a dynamically consistent physical model for transport and sorting in muddy turbidity currents. Hydraulic sorting aggregates finer material to the top and tail regions of a large turbidity flow which then overspills its channel banks. Downslope lateral sorting occurs with preferential deposition of coarser silt grains and larger mud flocs. Depositional sorting by increased shear in the boundary layer separates clay flocs from silt grains and results in a regular mud/silt lamination. Estimates can be made of the physical parameters of the turbidity flows involved. They are a minimum of several hundreds meters thick, have low concentrations (of the order of 0.001 or 2500 mg/l), and move downslope at velocities of 10-20 cm/s. A 5 mm thick, coarse silt lamina takes about 10 h to deposit, and the subsequent mud layer 'blankets' very rapidly over this. A complete unit is deposited in 2-6 days which is the time it takes for the turbidity flow to pass a particular point. These thick, dilute, low-velocity flows are significantly different from the 'classical' turbidity current. However, there is mounting evidence in support of the new concept from laboratory observations and direct field measurements. (Humphreys-ISWS)

ESTIMATING THE C FACTOR IN THE UNIVERSAL SOIL LOSS EQUATION FOR LANDSCAPED SLOPES,
Pennsylvania State Univ., University Park. Dept. of Agricultural Engineering.
W. R. DeTar, J. J. Ross, and R. L. Cunningham.
Journal of Soil and Water Conservation, Vol 35, No 1, p 40-41, January-February 1980. 2 Fig, 5 Ref.

Descriptors: *Soil erosion, *Erosion, *Mathematical models, *Equations, Model studies, Vegetation effects, Mulching, Trees, Canopy, Shrubs, Grasses, Landscaping, Raindrops, Rainfall, Universal soil loss equation.

The cropping and management factor, C, in the universal soil loss equation has not been measured on landscaped sites common in urban areas. Combinations of trees, shrubs, and groundcover can make the problem seem difficult to handle. Although such sites are usually heavily mulched soon after construction, the mulch deteriorates within a few years, leaving many areas subject to erosion. Wischmeier addressed the problem of soil losses on undisturbed areas, such as woodlands. His ap-

proach was modified to handle the problem in landscaped areas. This procedure represents the best method available for estimating the C factor for landscaped areas in the universal soil loss equation. (Sims-ISWS)

Use of ornamental trees, shrubs, and groundcovers for erosion control is common on steep slopes in urban areas. Organic mulches, such as wood chips, are often used immediately after planting to protect soil and conserve moisture for plants. These mulches effectively control erosion. Despite this initial protection, little attention has been given to these plantings to determine the amount of cover provided by established plants after the mulch has deteriorated. The problem of evaluating cover effectiveness and making recommendations for the use

DESCHUTES RIVER BASIN SUSPENDED SEDIMENT TRANSPORT STUDY,
Washington State Dept. of Ecology, Olympia.
A. Moore, and D. Anderson.
Project Report DOE-PR-7, July 1979. 24 p, 8 Fig, 1 Tab, 49 Ref.

Descriptors: *Sediment discharge, *Rivers, *Washington, *Suspended load, Sediment transport, Data collections, Suspended solids, Turbidity, Stream erosion, Bank erosion, Monitoring, Tributaries, River systems, *Deschutes River(WA).

The Deschutes River was dammed at its mouth in 1951 forming Capitol Lake, a 220-acre impoundment that is used for salmon culturing (Percival Cove) and a variety of recreational activities. The State of Washington, which is responsible for maintaining the lake, conducted the first major dredging operation during the 1978-79 winter. It became apparent during the planning of the Capitol Lake dredging project that insufficient information was available concerning the sources of the sediments that are reaching the lake. Therefore, during 1976-78, the Department of Ecology conducted sediment monitoring at selected locations in the Deschutes watershed. The study included two objectives: (1) identify sources of sediments transported by the Deschutes River; and (2) determine the quantity and significance of sediments contributed by each of the sources identified. This report presented and discussed the results of the 1977-78 monitoring effort. An estimated 3,043 tons (25%) of the 12,233 tons of suspended sediment originating from the upper Deschutes basin during November and December 1977 came from the tributaries monitored. The stream banks and channel appeared to account for the 9,190 ton (75%) difference. Another 6,029 tons was picked up along the lower Deschutes, nearly all of which appeared to come from the mainstem. These results indicate that the majority of the 18,262 tons (67%) of suspended sediments transported to Capitol Lake originated from the streambed and banks along the mainstem itself. (Humphreys-ISWS)

MATHEMATICAL MODELING OF SEDIMENT AND CONTAMINANT TRANSPORT IN THE JAMES RIVER ESTUARY,
Battelle Pacific Northwest Labs., Richland, WA.
Y. Onishi, and S. E. Wise.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 303-310, 1978. 7 Fig, 12 Ref, 1 Append. DOE EY-76-C-06-1830.

Descriptors: *Sediments, *Pollutants, *Rivers, *Mathematical models, Model studies, Sediment transport, Path of pollutants, Pesticides, Heavy metals, Nutrients, Radioactive wastes, Mathematics, Equations, Calibrations, Water pollution, Estuaries, *James River Estuary(VA).

Various contaminants (e.g., pesticides, heavy metals, nutrients, and radionuclides) discharged to surface waters are dispersed by currents, surface waves, and turbulent mixing. These contaminants are also adsorbed from solution onto sediment; thus, otherwise dilute contaminants are concentrated. This process may create a significant pathway to man. For example, contaminated sediments may be deposited onto river and ocean beds. Contaminated bed sediments in turn may become a long-term source of pollution through desorption and resuspension. In contrast, sorption by sediment can be an important mechanism for reducing the area of influence of these contaminants by reducing concentrations of dissolved constituents. To identify the effects of sediment transport on contaminant migration, the finite element sediment and contaminant model (FETRA) was applied to the James River estuary. The modeling procedure for FETRA involved simulating the transport of sediments (organic and inorganic materials) within the water body. The results were then utilized to simulate dissolved and particulate contaminants by taking into account interaction with the sediments. Finally, changes in river bed conditions were calculated including: (1) river bottom elevation change, (2) distributions of ratio of each bed sediment component in the bed, and (3) distribution of contaminants in the river bed. SEDIMENT TRANSPORT IN MIGRATING BED FORMS,
Science and Education Administration, Oxford, MS. Sedimentation Lab.
J. C. Willis, and J. F. Kennedy.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 551-560, 1978. 4 Fig, 23 Ref, 1 Append.

Descriptors: *Sediment transport, *Laboratory tests, *River beds, *Sediment discharge, Shape, Bed load, Dunes, Alluvial channels, Ripple marks, Mathematical models, Equations, Analytical techniques, Data collections, Statistical methods.

In recent years, application of spectral or time-series analysis to the description of sedimentary dunes has been quite successful. The objectives of the study reported were to develop a more rigorous formulation of dune-load transport based on a spectral description of the dune profiles and movement; to obtain detailed data on sediment transport and dune geometry and motion from a series of carefully conducted flume experiments; and to examine these and other flume data in the light of the new formulation with the goal of developing an improved predictor for the total-load discharge of alluvial streams. A series of 34 experiments was conducted in the 50 ft long, 1.18 ft wide, 2 ft deep, tilting, recirculating flume to obtain the detailed data required to verify the analytical model developed in this paper. Sieved quartz sand, retained between 0.5 mm and 0.7 mm sieves, was used. A detailed size analysis of the sediment gave a median particle size of 0.54 mm, and a median fall diameter of 0.50 mm. In view of the experimental results and the rigorous derivations leading to the duneload discharge relation, the equation not only extends stochastic analysis of bed forms beyond the realm of primarily a descriptive tool but also serves as a promising means for determining the dune-load discharge when bed elevation records are available. STOCHASTIC ASPECTS OF WATERSHED SEDIMENT YIELD,
Colorado State Univ., Fort Collins.
D. A. Woolhiser, and K. G. Renard.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 561-567, 1978. 1 Fig, 14 Ref.

Descriptors: *Watersheds(Basins), *Sediment yield, *Mathematical models, Sediment transport, Sediment discharge, Stochastic processes, Model studies, Theoretical analysis, Analytical techniques, Monte Carlo method, Rainfall, Runoff, Effects.

The sediment yield process may be divided into two categories--the upland phase and the lowland phase. Sediment detachment and transport processes predominate in the upland phase and depend on individual rainfall (or snowmelt) events. The magnitude of erosion from upland phase depends on factors like slope steepness and shape, cover, soil type, land use, and rainfall characteristics. In the lowland phase, sediment transport and deposition processes predominate, and the bed load transport capacity becomes a significant factor because channel flow is normally capable of transporting all the fine material available. Sediment transport rates are determined by hydraulic variables, like the flow depth and velocity, channel slope, water temperature, and physical properties of the sediments. The effect of individual precipitation events is highly damped. From examples in the literature, it appears that stochastic models of sediment yield have important application in design of dams, debris-basins, and other hydraulic structures. The approaches used in developing stochastic sediment yield models range from detailed, physically based models with distribution functions obtained by sampling from Monte Carlo simulations to empirical, event-based models for which distribution functions of sediment yield can often be obtained analytically. The best approach for any particular application depends greatly on the available data as well as the size of the watershed. (See also W80-05159) (Humphreys-ISWS)
W80-05208

ESTIMATING THE RISK OF CHANNEL EROSION,
Colorado Univ. at Denver. Dept. of Civil Engineering.
W. C. Hughes.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 568-573, 1978. 2 Fig, 1 Ref, 1 Append.

Descriptors: *Channel erosion, *Estimating, *Analytical techniques, *Risks, Data collections, Analysis, Erosion, Discharge(Water), Mathematical models, Statistical methods, Stream erosion, Soils, Sands, Gravels, Clays, Probability, Silts, Erosion potential.

The objective of the study described was to develop a method for estimating the potential for channel erosion, which would incorporate the random tendency of the variables while retaining data and computational requirements comparable to the permissible velocity method. The study involved two phases: The first phase was an analysis of field data to develop curves relating the probability of significant erosion in a channel to flow rate, hydraulic characteristics, and soil conditions. These curves were referred to as erosion potentials. The second

phase was the derivation of a procedure for combining a channel's erosion potential with the channel's discharge frequency curve to yield the probability, or risk, of erosion in a given reach of stream channel. The latter provides a method for accounting for situations where the likelihood of erosion is quite low, even in a highly erodible channel, simply because erosion-producing discharges occur infrequently. The proposed method provides a quick means to estimate the erosion risk in a stream channel using data which is normally available. The method cannot replace an extensive erosion survey but was not intended to do so. The sand-silt, silt-clay, and clay erosion potential diagrams have an acceptable degree of statistical reliability although upper boundary on clay erosion potential diagram is somewhat questionable. The gravel-silt erosion potential diagrams are of marginal statistical reliability. When channel discharges exceed 10 cfs, the risk of channel erosion can be estimated directly from the appropriate erosion potential diagram. (See also W80-05159) (Humphreys-ISWS)

SEDIMENT AND PCB TRANSPORT MODEL OF THE HUDSON RIVER,
Lawler, Matusky and Skelly Engineers, Pearl River, NY.
G. A. Apicella, and T. F. Zimmie.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 645-653, 1978. 2 Fig, 2 Tab.

Descriptors: *Model studies, *Sediment transport, *Polychlorinated biphenyls, *Hudson River, Mathematical models, Sediments, Rivers, Deposition(Sediments), Bed load, Scour, On-site investigations, Calibrations, Methodology, Analytical techniques, Sediment discharge, *Lock 7(NY), *Troy dam(NY).

The purpose of this study was to model mathematically the transport of PCB-contaminated sediments through a 40-mile segment of the Upper Hudson River. Furthermore, because PCBs were recognized to be present in both the river bed and water column partitions of the river system, the major objectives were to analyze the stability of the PCB-laden sediments lying on the river bed and project the contaminant loading of the upper river to the estuary. The area modeled includes approximately 40 miles of the Hudson River between Lock 7 (RMI 193.7) and the Troy dam (RMI 153.9), and represents a total drainage area of 8090 sq mi. A series of eight dams divides this portion of the river into eight reaches defined as the extent of river from oe dam to the next. A systems analysis approach to the study consisted of various submodels that relate the quantity of flow through the river to an associated sediment load, which contains a certain mass of PCB in transport. This analysis which assumes the continuation of natural river conditions serves as a benchmark for comparing various remedial action programs. This modeling framework is capable of assessing the effects of various remedial alternatives and should be applied to the partial dredging program currently under consideration. SEDIMENT MOVEMENT IN A SMALL HUMID WATERSHED,
Hawaii Univ., Honolulu.
P. D. Bartram, and G. L. Dugan.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 654-661, 1978. 3 Fig.

Descriptors: *Sediment transport, *Small watersheds, *Hawaii, *Model studies, Sedimentation, On-site investigations, Suspended solids, Suspended load, Turbidity, Storm runoff, Deposition(Sediments), Analysis.

Water quality standards pertaining to sediments require some kind of mathematical model. It is advantageous for water quality management if such models are fairly simple and highly transferrable to situations other than the areas where they are first developed and calibrated. This paper examined three different approaches--criteria or standards--that might have been applied to a perennial stream discharging to a large embayment in Hawaii. Each standard was useful for a limited part of the overall range of sediment pollution. Turbidity was the best indicator of sediment problems during low flow periods; suspended sediment concentration arrayed in a log-normal distribution was the best indicator of deviations for storm flow events up to the most extreme occurrences; and the thickness of sediment deposited over living corals on the reef was the best indicator for the most extreme storm runoff events. Most of the documented sediment damage to reef ecology in Kaneohe Bay was associated with extreme flood events, which occurs when the rate of sediment deposit exceeds the rate of removal by waves and the self-cleansing ability of the coral animals themselves. If the thickness exceeds 0.12 inch for a period of even one day, the more silt-resistant species of coral would be smothered to death. (See also W80-05159) (Humphreys-ISWS)

A SEDIMENT YIELD ROUTING MODEL,
Science and Education Administration, Temple, TX.
J. R. Williams.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 662-670, 1978. 2 Tab, 5 Ref.

Descriptors: *Sediment yield, *Routing, *Mathematical models, *Agricultural watersheds, Model studies, Equations, Deposition(Sediments), Degradation(Stream), Analytical techniques, Analysis, Bed load, Open channels, Sediment discharge, Sediment routing model.

A model for routing individual storm sediment yields through large agricultural basins was described. The model consists of two components for simulating the deposition and degradation processes. Deposition depends upon sediment particle size and the change in peak flow rate within a routing reach. The deposition model was developed previously but was restructured here to exclude channel and floodplain degradation. Previously, the sediment routing model contained a crude degradation component based on MUSLE. A new degradation model based on stream power was developed in this paper. One of the stream power parameters, evaluated for bed load prediction, was used in the degradation model. A technique was developed for estimating the other parameter. Although more work is needed to validate the parameter estimates, the stream power approach has a stronger physical basis than the previous degradation model. Also, the new model outputs sediment graphs resulting from degradation. Only the total degradation could be predicted with the original model. Tests with data from three Texas basins showed that the sediment-routing model gives realistic predictions. The model should be useful in determining nonpoint source pollution because it operates on individual storms and identifies subbasin contributions. (See also W80-05159) (Humphreys-ISWS)

In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 671-678, 1978. 7 Fig, 6 Ref.

Descriptors: *Sediment yield, *Small watersheds, *On-site tests, *Model studies, Hydrographs, Sediments, Discharge(Water), Erosion, Analysis, Forecasting, Runoff, Sediment discharge, Sediment yield model.

This paper described a computational model for predicting the unsteady movement of water and sediment generated by single runoff events. The model basically consists of two intertwined models: one describing the hydrology of the basin, the other describing the associated erosion and sedimentation processes. The present model simulates the movement of water and sediment as a time and space distributed process, and it has the ability of distinguishing between overland and channel flows. The watershed is regarded as consisting of a mosaic of individual but interconnected subcatchments. Within each of these subcatchments, the characteristics of the terrain and precipitation distribution are assumed uniform. The model can thus be regarded as a cascading process in which the output of one or more subcatchments becomes the input to another subcatchment or channel reach. In mimicking the overland movement of water and sediment, the model simulates processes of interception, infiltration, runoff, detachment, transport, and deposition of sediment. The water and sediment reaching the streams are then routed through the channel system, and the rates of channel aggradation and degradation are computed. The applicability of the model is restricted, so far, to watersheds where the streamflows are ephemeral, the subsurface flow and groundwater movement are not significant, and the kinematic wave approximation for flow routing is valid. SEDIMENT MODEL VERIFICATION FOR SMALL DIVERSIONS,
Water and Power Resources Service, Denver, CO.
R. A. Dodge.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 753-758, 1978. 2 Tab, 1 Ref.

Descriptors: *Model studies, *Sediments, *Diversion, Calibrations, Sediment transport, Hydraulic models, Methodology, Sediment load, Roughness(Hydraulic), Roughness coefficient, Froude number, Hydraulics, Hydraulic similitude, Model verification.

Normalized equations, whether solvable or not, aid in the design and verification of a model by showing what dimensionless parameters are involved and what groups of dimensionless variables for which they are coefficients. Verification should be directed to finding the values of these parameters for both the model and prototype, then the modeler can determine for what ranges the model is valid, and in some cases the error of some of the variables can be determined and possibly corrected if distortion is not too great. For coarser bed materials, the portion of the grain distribution that governs roughness can also nearly scale geometrically. Thus, both friction and relative roughness can be the same for model and prototype. Verification data, especially for a rehabilitation model, help develop a base for the existing system to compare proposed modifications in a more quantitative way. For sediment models of small diversions the modeler is dependent upon the skill of hydrologists in making flow duration analyses computation of water surface levels and sediment load to augment scarce field data. Adequate verification effort can help substantiate bed sampling, computed hydrologic estimates, and mathematical models as well as the physical modeling techniques used. Descriptors: *Sediment yield, *Mechanical equipment, *Accelerated erosion, *Erosion rates, Evaluation, California, *Off-road vehicles, Ventura County(Calif), Los Angeles County(Calif), Hungry Valley, Canada de Los Alamos.

An assessment of present erosion and sedimentation conditions in the Canada de Los Alamos basin, Calif., was made to aid in estimating the impact of off-road-vehicle use on the sediment yield of the basin. Evaluations were made by reconnaissance techniques and by comparing the study area with other off-road-vehicle sites in California. Major-storm sediment yields for the basin were estimated, using empirical equations developed for the Transverse Ranges and measurements of gully erosion in a representative off-road vehicle basin. Normal major-storm yields of 73,200 cubic yards would have to be increased to about 98,000 cubic yards to account for the existing level of accelerated erosion caused by off-road vehicles. Long-term sediment yield of the Canada de Los Alamos basin upstream from its confluence with Gorman Creek, under present conditions of off-road-vehicle use, is approximately 420 cubic yards per square mile per year--a rate that is considerably lower than a previous estimate of 1,270 cubic yards per square mile per year for the total catchment area above Pyramid Lake. APPROXIMATION FOR SALT-WATER INTRUSION IN UNCONFINED COASTAL AQUIFER,
Asian Inst. of Tech., Bangkok (Thailand). Div. of Water Resources Engineering.
B. K. Panigrahi, A. Das Gupta, and A. Arbhabhirama.
Ground Water, Vol 18, No 2, p 147-151, March-April 1980. 5 Fig, 16 Ref.

Descriptors: *Saline water intrusion, *Coasts, *Aquifers, *Model studies, Mathematical models, Saline water-freshwater interfaces, Equations, Groundwater, Groundwater movement, Permeability, Water levels, Density, Unconfined coastal aquifers.

A numerical model based on a finite difference technique was developed to analyze and solve the problem of an unconfined coastal aquifer of infinite extent with free surface and interface along with the width of outflow face as unknown boundaries. The problem was formulated in a complex potential plane, and a five-point operator of a finite difference scheme was used to reduce the governing flow equation into a set of linear algebraic equations which was solved by the Gauss-Seidel iterative method with an overrelaxation factor. Results of the analysis provided a generalized dimensionless plot for assessing the freshwater flow to the sea from the known field information of aquifer characteristics and water-table head landward from the shoreline. Descriptors: *Estuaries, *Algae, *Chlorophyll, *Suspended solids, *New England, Sampling, On-site investigations, Laboratory tests, Zooplankton, Diatoms, Benthic flora, Biomass, Microorganisms, Biological communities, Sediments, Tides, Tidal effects, Circulation, Water circulation, Biology, Mud flats, Coasts, Resuspension.

The distribution of microalgal biomass in the sediments and water column of a salt marsh and mudflat ecosystem was studied over a 15-month period by fluorometric analysis of chlorophyll a. Chlorophyll entered the water column on the early flood tide due to the resuspension of intertidal mudflat sediments and associated epipelic algal flora. By mid-flood tide, chlorophyll values were surpassed by its degradation products. Unusually large numbers of bivalves and other suspension feeders present in the system may have processed the water and released fecal materials, thus raising the concentration of pheopigment in the water column between early and mid-flood tide. By mid-ebb, the pigment levels had declined, possibly due to the settling of algal cells and feces. Resuspension recommenced briefly by late ebb as the system emptied. Calculations revealed that if 10 to 15% of the mudflat sediments were resuspended to a depth of 1 mm, it could account for the chlorophyll levels inside the estuary which were high compared to neighboring systems. Pigment gradients in the water column and sediments indicated net transport of epipelic algae from the mudflat to the salt marsh where most of the bivalves were located. Suspended material concentrations as well as counts of epipelic and phytoplankton furstules suggested that epipelic algae in shallow estuarine systems may be an important food source for the filter feeding community when made available twice daily by tidal resuspension of sediments. VELOCITY PROFILES OVER A RIPPLED BED AND THE THRESHOLD OF MOVEMENT OF SAND,
Institute of Oceanographic Sciences, Taunton (England).
K. R. Dyer.
Estuarine and Coastal Marine Science, Vol 10, No 2, p 181-199, February 1980. 12 Fig, 1 Tab, 28 Ref.

Descriptors: *Ripple marks, *Sediment transport, *Sands, *Coasts, Tides, Tidal effects, Circulation, Water circulation, Shear stress, Velocity, Sediments, On-site investigations, Current meters, Data processing, Analytical techniques, Roughness(Hydraulic), Flow friction, Oceanography, *England coast.

Measurements of velocity profiles were obtained within 2m of the sea bed over a rippled sand in Start Bay, Devon, U.K. Simultaneous observation by underwater television has enabled the threshold of movement of the sand to be determined. The threshold criteria are considerably higher than laboratory measurements for a flat bed. As the sand moves, the ripples change their shape. This causes a change in the bottom roughness length, the drag coefficient, and the apparent threshold of sand movement during the tidal cycle. The bottom roughness length and the threshold of movement also increase with decreasing tidal amplitude. The calculated suspended sediment concentration at the height of bed roughness length was proportional to the normalized excess shear stress with a constant of proportionality of 0.000078. The concentration at a height of 10 cm was proportional to (u sub *) to the 5th power. (Sims-ISWS)

Descriptors: *Salt marshes, *Soil properties, *Sulfates, *Methane, *Georgia, Coasts, Soils, Vegetation, Vegetation effects, Grasses, Marshes, Sampling, Cores, Laboratory tests, Chemistry, Soil chemistry, Soil tests, Soil science, *Georgia coast, Methanogenesis, Salt marsh soils.

Controls of methanogenesis in soils of Sapelo Island, Georgia, salt marshes were investigated by altering water movement through soils of the tall Spartina alterniflora region (TS). Vertical water movement was shown to maintain the concentration of sulfate at levels near that of the tidal waters which flood the TS. Restriction of vertical water movement resulted in a decrease of interstitial sulfate concentration by a factor of 2-5 over a period of 2 months. This decrease in sulfate was accompanied by a marked increase in vitro methane production. Sulfate depletion was postulated to occur in microzones within the soil; methane formation occurs subsequent to this depletion. In situ differences between methanogenesis in TS and SS regions were suggested to be the result of such depletion. (Sims-ISWS)

A SMALL CLIFF-BOUND ESTUARINE ENVIRONMENT: SANDYHAVEN PILL IN SOUTH WALES,
Reading Univ. (England). Sedimentology Research Lab.
C. J. H. King.
Sedimentology, Vol 27, No 1, p 93-105, February 1980. 7 Fig, 2 Tab, 28 Ref.

Descriptors: *Estuaries, *Estuarine environment, *Deposition(Sediments), *On-site investigations, Tidal waters, Stratigraphy, Geomorphology, Erosion, Bank erosion, Aquatic life, Sediments, Aquatic plants, Aquatic animals, Biota, Spatial distribution, United Kingdom, *Sandyhaven Pill(South Wales), Cliff erosion.

Sandyhaven Pill is a 'drowned valley' type of estuary. Thus the deposits differ from most other described estuarine deposits which are of 'tidally influenced river' type. The surface sediments may be divided broadly into wave-dominated deposits (22% of area), tide-dominated deposits (65%), deposits related to marginal cliff collapse (12%), and river-dominated deposits (1%). Further subdivision shows that the subenvironments are nested in a progression up the estuary with trends to finer sediment size, reduced sorting, and increased biogenic activity. The latter relates to a marine to estuarine faunal change and a strong relationship between the distributions of biota and depositional subenvironments. Over a 29 day period, reduction in wave height was reflected in wave-dominated areas by shoreward movement of some subenvironment boundaries and by improved definition of symmetrical ripples. The tidal cycle had only a limited effect on the tide-dominated sediments. The most reliable indicators of estuary trend are channels and asymmetrical ripples; but coring shows that ripples and other minor structures are rarely preserved. Heavy mineral analysis indicates that most of the estuarine sand came from offshore. Gradual sediment buildup will result in a regressive sequence. If this were preserved under a later transgression, the resultant deposit would be an elongate sediment body bounded laterally by a coarse marginal facies. The sediment sequence would be inward and upward fining with diachronous facies boundaries sloping upwards towards the offshore end and towards the axis of the body. (Humphreys-ISWS)

Sea surface elevations, or pressures, and velocities were measured at closely spaced (wavelength or less) locations in a line extending from 10-m depth to inside the surf zone at Torrey Pines Beach, San Diego, California. Intercomparisons of local pressure, velocity, and sea surface elevation spectra for the wind wave frequencies (0.05-0.3 Hz) were made by using linear wave theory. Errors in both total variance and energy density in a particular frequency band were less than 20% both inside and outside the surf zone, except in the immediate vicinity of the breakpoint, where larger disparities were observed. Surface elevation spectra calculated at 10 m were shoaled by using linear wave theory. The total variance of stations between 10- and 3-m depth were typically predicted with less than 20% error, although harmonic amplification and other nonlinear effects can lead to significant errors in the prediction at particular frequency bands. Observations inside 3-m depth significantly departed from the predictions of linear shoaling theory. (Sims-ISWS)

TEMPORAL AND SPATIAL VARIABILITY IN LONGSHORE MOTION ALONG THE TEXAS GULF COAST,
Harbor Branch Foundation, Inc., Fort Pierce, FL.
N. P. Smith.
Journal of Geophysical Research, Vol 85, No C3, p 1531-1536, March 20, 1980. 6 Fig, 2 Tab, 15 Ref. BLM AA550-CT7-11.

Descriptors: *Currents(Water), *Coasts, *Texas, *Gulf of Mexico, *Variability, On-site investigations, Ocean currents, Current meters, Measurement, Temporal distribution, Spatial distribution, Data processing, Water circulation, Oceans, Oceanography, Longshore motion, Texas Gulf Coast.

Recording current meter data from a 43-day period in the summer of 1977 were used to investigate longshore coherence at three study sites along the central and lower Texas coast in the northwestern Gulf of Mexico. Mid-depth current data from inner shelf waters revealed an alternating longshore motion that is coherent with the longshore component of the wind stress. Current reversals occured over time scales of the order of 1-2 weeks, but there was a net displacement into the north-northeasterly quadrant at all three locations. Transient periods of convergence and divergence were suggested between adjacent study sites as a result of not quite simultaneous reversals in longshore motion, or gradients in longshore motion in the same sense. Spectral analysis of the longshore current components indicated that motion is very nearly in phase along this part of the coast and that the flow is highly coherent over time scales in excess of about 3 days. VERIFICATION OF A STORM TIDE MODEL FOR BOSTON,
Harris (Frederic R.), Inc., New York.
M. J. McCarthy, E. J. Schmeltz, and R. G. Dean.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 172-188, 1978. 24 Fig, 11 Ref.

Descriptors: *Tides, *Model studies, *Storms, *Harbors, *Massachusetts, Floods, Tidal effects, Tidal waters, Calibrations, Hurricanes, Analytical techniques, Storm surge, On-site investigations, Analysis, Methodology.

This paper deals with the verification of a numerical winter storm surge model. The coastal areas for which flood elevations were determined include the northern portion of Boston Harbor extending into the Mystic, Charles, and Chelsea Rivers to the upstream limits of tidal flow. Much of the coastline in the study area is bordered by piers and wharves with an average elevation 10 feet above mean sea level (MSL). The coastline of South Boston bordering Dorchester Bay consists mainly of beaches which slope steeply upward to approximately 10 feet above MSL. The major storms affecting the study area are winter storms commonly known as Northeasters. The numerical model developed to calculate winter storm surges was found to agree well with observed water levels for the various winter storms studied. The Bathystrophic assumptions made in order to limit computing time and expense did not significantly affect the calculated water levels. These assumptions were possible due to the extremely large size of the winter storms in the Boston area and the predominance of these storms in the determination of maximum storm tide levels. The assumption of an elliptical pressure field was also shown to reflect accurately the observed winter storm pressure fields studied. (See also W80-05159) (Humphreys-ISWS)

GROUNDWATER SIMULATION FOR KOEBERG POWER STATION,
University of the Witwatersrand, Johannesburg (South Africa). Dept. of Hydraulic Engineering.
D. Stephenson.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 197-205, 1978. 3 Fig, 5 Ref.

Descriptors: *Groundwater, *Model studies, *Saline water intrusion, *Hydrogeology, Coasts, Mathematical models, Foreign research, Groundwater movement, Aquifers, Transmissivity, Storage coefficient, Calibrations, On-site investigations, *South Africa.

The Koeberg Nuclear Power Station in South Africa is under construction. The foundations of the station are below sea level and there is a possibility of seawater corroding the sand-cement concrete raft unless the seawater/fresh water interface is controlled and the depression in the water table, caused by dewatering, is replenished with fresh water. A computer program was developed to simulate the water table fluctuations and groundwater flow in the vicinity of the foundations. Pumping tests were performed to determine the geohydrological coefficients. Fissures in the bedrock caused inflows not predicted by the computer model until the geohydrological coefficients were suitably adjusted. The model successfully predicted the seawater encroachment into the foundation area of the power station during dewatering. It was further predicted that once foundation construction was complete and the water table permitted to revert to normal, saline water would be drawn into the cutoff area. Replenishment with fresh water within the cutoff area instead of saline water would be a solution. The model could also be used to simulate the flow and dispersion of contaminated water if there were a leak from the station. (See also W80-05159) (Humphreys-ISWS)

In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of

the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 222-229, 1978. 6 Fig, 6 Ref.

Descriptors: *Estuaries, *Model studies, *Tides, *Virginia, Calibrations, Water levels, Tidal effects, Hydraulic models, Mathematical models, Currents(Water), Salinity, Water quality, Analysis, *Lafayette River(VA), *Norfolk(VA), Model verification.

A physical model and a mathematical model have been used to study the Lafayette River, a small well-mixed estuary in Norfolk, Virginia. The studies include the tide heights, currents, salinity distributions, and mass transport. Both types of model were verified. Results from physical and mathematical models were compared. The physical model is a Froude model having horizontal scale of 1:540 and vertical scale of 1:12. Adjustment by roughness strips produced close agreement of physical model-prototype tide heights, currents, and salinity. An existing one-dimensional network mathematical model of LaGrangian formulation, developed by Brandsma, Lee, and Bowerman, was modified to predict hydrographic information and dispersion of mass in the Lafayette River. The tidal heights, currents, and salinity distribution in the physical model were calibrated against the prototype data. The objective was to achieve the best overall agreement in adjustments for all three quantities at all stations with a reasonable degree of accuracy. The three quantities in the physical model compared favorably with those in the prototype. The mathematical model simulated the desired tidal heights and current velocities quite well. The conjunctive use of the physical and mathematical models provides a useful tool to check each other and therefore increases the confidence level of the modeling techniques. A DYNAMIC ESTUARY MODEL OF CHARLESTON HARBOR,
CH2M/Hill, Reston, VA.
M. G. Taylor, R. S. Taylor, and M. R. Stansbury.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 230-236, 1978. 1 Ref.

Descriptors: *Harbors, *Hydraulics, *Water quality, *Model studies, Mathematical models, Estuaries, Rivers, Flow, Streamflow, Pollutants, Path of pollutants, Rainfall, Winds, Evaporation, Sampling, Data processing, Calibrations, *Charleston Harbor(SC).

The Dynamic Estuary Model (DEM) was modified for application to the Charleston Harbor, South Carolina. A network of 17 tide gages provided the historical record for calibration and verification of the hydrodynamic portion of the model for the three main branches of the estuary, the Cooper, Wando, and Ashley rivers. Modifications to the model allowed acceptance of historical boundary tide elevation inputs and stage dependent channel roughness coefficients. System response to large diurnal fluctuations in Pinopolis Dam freshwater releases from Lake Moultrie at the head of the Cooper River verified the use of hydrograph inputs to the model. A water quality sampling program conducted in short, intensive periods over a 14-day period at 20 sites provided the data base for calibration of the water quality portion of the model. Conductivity measurements, in the absence of flow measurements, provided additional verification of the hydraulics calibration of the rivers. The model was used to analyze the impact of rediversion of freshwater from Lake Moultrie to the Santee River and for evaluating alternative water quality management planning strategies developed in the 208 areawide wastewater management plan being done by the Berkeley-Charleston-Dorchester Council of Governments. VERIFICATION OF AN ESTUARINE MODEL FOR APALACHICOLA BAY, FLORIDA,
Florida Univ., Gainesville. Dept. of Civil Engineering.
D. S. Graham, J. M. Hill, and B. A. Christensen.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 237-245, 1978. 8 Fig, 7 Ref. NOAA 04-7-158-44046.

Descriptors: *Estuaries, *Water quality, *Model studies, *Remote sensing, *Florida, Satellites(Artificial), Mathematical models, Calibrations, Turbidity, Hydrogen ion concentration, Suspended solids, Dissolved oxygen, Water pollution, Color, Rivers, Coasts, Tidal waters, *Apalachicola Bay(FL).

The water quality management process in Florida requires analysis of the effects of basin activities and associated point and nonpoint effluents upon its important coastal zone. Determination of the effects of nonpoint source pollution from agricultural and silvicultural activites, as required by Section 208(I) of the Federal Water-Quality Act of 1972 Amendments, has proved to be particularly difficult. A current research project at the Hydraulic Laboratory of the University of Florida involves linking appropriate currently available basin runoff and estuarine models to quantitatively predict the transient effects of runoff emanating from upland basin activities, particularly forestry practices, upon the biology and water quality of Apalachicola Bay, FL. A cooperative project with the EPA Remote Sensing Laboratory in Las Vegas provided several Landsat images of both Apalachicola Bay and the Tate's Hell Swamp area. Special analyses of spectral signatures allowed differences in surface water color and turbidity to be highlighted, and a set of images was produced in which characteristic circulation patterns may be distinguished. Examination of properly processed Landsat images can allow stationary sampling stations to be advantageously placed, and provides great ability to correctly extrapolate data spatially from a few sampling stations. The data so gathered and estimated are instantaneous and therefore amenable to verification of so-called real-time water quality and hydrodynamic numerical models. (See also W80-05159) (Sims-ISWS)

Descriptors: *Bays, *Estuaries, *Water circulation, *Hydrodynamics, *Model studies, Mathematical models, Finite element analysis, Shallow water, Coasts, Circulation, Currents(Water), Tidal waters, Tides, Tidal effects, Boundary processes, *Biscayne Bay(FL).

In recent years the adaptation of numerical models to predict the tidal hydraulics of coastal embayments and estuaries has become an important tool in environmental studies. For shallow water bodies the two-dimensional vertically integrated or averaged models are the most widely used. Early finite difference models suffer from difficulties in treating complicated boundaries properly; however, several new techniques have been introduced to overcome these problems and to allow for a variable grid network. The Circulation Analysis with Finite Elements model (CAFE) represents one of these newer developments. Although these models aid in the qualitative understanding of fundamental physical processes, their primary purpose is to provide quantitative data. Confidence in the performance of these models under varying conditions as well as user proficiency must be established through verification. This paper described the field comparison for CAFE in South Biscayne Bay, Florida. Similar bays are found throughout southern Florida and along the Gulf coast. Although put to a severe test, since no adjustments were attempted, the hydrodynamic model, CAFE, gave a reasonable prediction of overall flow patterns in Biscayne Bay. The model, therefore, seems to describe correctly the principal physical processes. The main obstacles in obtaining accurate quantitative results lie in correct schematization and prescription of boundary conditions. (See also W80-05159) (Sims-ISWS)

VERIFICATION OF A NUMERICAL FLOW MODEL FOR CAROLINA BEACH INLET, NORTH CAROLINA,
North Carolina State Univ. at Raleigh. Center for Marine and Coastal Studies.
T. C. Gopalakrishnan, and J. L. Machemehl.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 509-517, 1978. 6 Fig, 5 Ref. NOAA 04-6-158-44054.

Descriptors: *Inlets(Waterways), *Currents(Water), *Water circulation, *Model studies, *North Carolina, Mathematical models, Circulation, Velocity, Tidal waters, Tides, Tidal effects, Flow, Analytical techniques, Finite element analysis, Estuaries, Coasts, *Carolina Beach Inlet(NC).

The numerical flow model developed by Machemehl and Gopalakrishnan for computation of flow in tidal inlets with junctions has been applied to Carolina Beach Inlet, North Carolina. The model couples the Galerkin Technique with a finite element analysis. The vertically integrated equations of momentum and mass conservation were used with appropriate boundary and initial conditions. The junction conditions were introduced by the time rates of change of energy and mass flux at the junction. A 'double sweep' approach was used in solving for the dynamics of flow. The method has several advantages in that the coefficient matrix in the solution system does not change as the model is stepped ahead in time. The Galerkin finite element model for flow in an inlet was found satisfactory considering the complex nature of the flow in a tidal inlet. (See also W80-05159) (Sims-ISWS)

TIDAL CIRCULATION IN COASTAL SEAS,
Rhode Island Univ., Kingston. Dept. of Ocean Engineering.
C. H. Beauchamp, and M. L. Spaulding.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 518-528, 1978. 9 Fig, 1 Tab, 15 Ref.

Descriptors: *Bays, *Tidal waters, *Water circulation, *Tides, *Model studies, *New England, Mathematical models, On-site data collections, Circulation, Tidal effects, Winds, Bathymetry, Currents(Water), Velocity, Coasts, Estuaries.

An application of Leendertse's multioperational finite difference scheme for solution to the two-dimensional, vertically integrated momentum and continuity equations has been made for tidal circulation in Long Island Sound, Block Island Sound, Rhode Island Sound, and Buzzards Bay (referred to as the Southern New England Intracoastal System). The circulation within the modeled region is predominantly forced by specification of tidal elevation along the large open boundary separating the system from New England shelf waters. No direct measurements of tidal elevation along this boundary exist, however, and an attempt to estimate this boundary condition has been made using range and phase at stations on the coast and limited tidal information for the shelf in the vicinity of the open boundary. The model was calibrated by comparing phase and range of tidal elevations obtained from the simulations with those measured at 46 locations within the modeled region. An optimal matching was accomplished by adjustment of bottom friction. Further comparison has been conducted using tidal current observations from several stations in Rhode Island Sound and a set of approximately 160 stations in Long Island and Block Island Sound. VERIFICATION OF FIXED-BED ESTUARINE MODELS,
Army Engineers Waterways Experiment Station, Vicksburg, MS.
M. J. Trawle, and R. F. Athow, Jr.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 583-590, 1978.

Descriptors: *Hydraulic models, *Estuaries, *Model studies, *Tidal waters, Currents(Water), Tidal effects, Shoals, Flow, Salinity, Calibrations, Fixed bed models, Model verification.

A fixed-bed estuarine model is a physical, hydraulic model of an estuary, molded in concrete, and scaled according to Froudian law. This type model is usually distorted. A typical scale is 1000 to 1 (prototype to model) horizontally, and 100 to 1 (prototype to model) vertically, resulting in a distortion ratio of 10 to 1. Fixed-bed estuarine models are designed to reproduce prototype water surface elevations, tidal currents, and salinities throughout the modeled area. Additionally, in such models design consideration is given to the reproduction of prototype sediment distribution within a portion of the modeled area. The worth of any model, physical or otherwise, is wholly dependent on the verification of the ability to produce within a reasonable degree of accuracy results which can be expected to occur in the prototype under given conditions. Verification of a fixed-bed estuarine model is generally accomplished in three phases: (1) hydraulic verification, which ensures that tidal elevations and phasing and current velocities and directions are in proper agreement with the prototype; (2) salinity verification, which ensures that salinity phenomena in the model correspond to those of the prototype for similar conditions of tide, ocean salinity, and freshwater inflow; and (3) fixed-bed sediment distribution verification, which assures acceptable reproduction of prototype sediment distribution. FIELD VERIFICATION OF SEDIMENT TRANSPORT MODEL,
Florida Univ., Gainesville. Dept. of Coastal and Oceanographic Engineering.
T. T. Chang, and Y. H. Wang.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 737-744, 1978. 2 Fig, 3 Tab, 5 Ref.

Descriptors: *On-site tests, *Sediment transport, *Model studies, *Coasts, Sediments, Movement, Littoral drift, Sands, Tracers, Methodology, Analysis, Analytical techniques, Mathematical models, Statistical methods, Model verification.

The purpose of this study was twofold: to investigate the sand transport rate under the wave and current action of the bayshore of a barrier island and to determine how different grain sizes and tracer injection positions affect the sand transportation rate. The sand-tracing method is used for determining the littoral transport rate. The data were analyzed by statistical methods. The effect of grain size on the sediment transport rate at different injection positions was analyzed by equating the grain size to the proportionality coefficient at different injection positions. The K' values were tested by the analysis of variance. It was concluded: (1) In this experiment the proportionality coefficient is not significantly influenced by the injection position and the grain size. The mathematical model has verified that the relationship between the immersed weight transport rate and wave and current parameters is linear. (2) The proportionality coefficient between the longshore transport rate and the wave and current parameters was determined by regression analysis. A regression line forcing through the origin incorporates most of the data points within the 95% confidence limits and accounts for 94% of the variation. (3) The proportional coefficient, K' = 0.18, on the bayshore of Santa Rosa barrier island is different from that derived by Komar. This difference may have resulted from the dissimilar transporting characteristics. On the bayside, wind may have played a noticeable role, while on the open coast the oblique breaking waves are prominent. (See also W80-05159) (Humphreys-ISWS)

TWO-DIMENSIONAL TIDALLY AVERAGED ESTUARINE MODEL,
Humboldt State Univ., Arcata, CA. Dept. of Environmental Resources Engineering.
W-S. Chu, and W. W-G. Yeh.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY4, Proceedings Paper 15345, p 501-518, April 1980. 8 Fig, 25 Ref, 2 Append. OWRT B-191-CAL(2).

Descriptors: *Estuaries, *Model studies, *Tidal waters, *Dispersion, Mathematical models, Salinity, Tidal energy, Average, Numerical analysis, Water quality, Hydrodynamics, Analytical techniques, Equations, Tidal effects, Hydraulics, Two dimensional model.

Two types of models have been used extensively in the studies of estuaries: (1) physical hydraulic models and (2) numerical models. This study deals with vertically averaged two-dimensional numerical models for estuarine hydrodynamics and salinity. The governing equations are the hydrodynamics equations coupled with the transport equation. The effect of the density gradient was included in the model which requires simultaneous solutions for all variables. The tidally averaged solutions and the associated numerical scheme were verified by solutions obtained from a corresponding transient model where long term integration was performed to reach a dynamic steady-state condition. The proposed model can be utilized to: (1) obtain dynamic steady-state solutions directly without performing long term integrations over time; and (2) serve as an efficient forward solution scheme for parameter identification, since parameters imbedded in the governing equations, such as the roughness coefficients, are essentially time-invariant. The tidally averaged model was derived under the assumption that amplitudes of the transient variables are small in magnitudes. (Humphreys-ISWS)

REVERSE OSMOSIS TECHNICAL MANUAL.
Burns and Roe Industrial Services Corp., Paramus, NJ.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-186950, Price codes: A13 in paper copy, A01 in microfiche. Final Report OWRT TT/80 2 Prepared for the Office of Water Research and Technology, July 1979. 286 p. OWRT C-80155-S (No 8530)(1), 14-34-0001-8530.

Descriptors: *Reverse osmosis, *Semi-permeable membranes, *Membrane systems, Feedwater pretreatment, Salt rejection, Desalination, Seawater, Brackish water, Dissolved solids rejection.

A comprehensive design manual was compiled for reverse osmosis systems suitable for use by consulting engineers and others actively involved in water supply and improvement for municipal water systems. The manual includes chapters on semipermeable membranes, membrane module configurations, feedwater treatment, dissolved solids rejections, membrane productivity, systems design, system installation and operation, membrane applications, selected capital and annual costs and specifications and warranties. Appendices include miles-

tones in development of reverse osmosis, directory of manufacturers, water quality standards, performance calculations, glossary of terms, conversion tables and miscellaneous figures and tables. (Easton-OWRT)

Descriptors: *Irrigation design, *Water conservation, *Energy conservation, *Irrigation efficiency, *Agriculture, Water management(Applied), Irrigation systems, Furrow systems, Water requirements, Nebraska.

Research was conducted to determine irrigation management practices on the various soil textures in Nebraska. The basic objective was to design and select irrigation systems to minimize water and energy requirements. To meet this objective, improved irrigation practices were investigated for more efficient use of water and energy resources. Research has indicated that irrigating at maximum non-erosive stream size and automating the furrow irrigation system, one can reduce the irrigation set time and amount of water applied to acceptable levels. This design criteria substantially increases the efficiency of water and energy used. Research has also shown that the selection of various furrow opening and furrow smoothing practices influences the amount of water applied and should be selected according to the soils infiltration characteristics. Applying a maximum two-inch application of water is recommended during the first irrigation and up to a three-inch application for subsequent irrigations. Research indicates that various irrigation scheduling methods may be used to make efficient use of water and energy which may improve these practices. A state-wide program of technology transfer by the Cooperative Extension Service was developed to disseminate research results to farmers, agricultural consultants and other groups who may make immediate application of results.

4A. Control Of Water On The Surface

AN INTERACTIVE SIMULATION OF PUMPED STORAGE RESERVOIR SYSTEMS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
W. F. Calhoun, E. F. Benfield, and D. N. Contractor.
Water Resources Bulletin, Vol 16, No 1, p 63-68, February 1980. 7 Fig, 14 Ref.

Descriptors: *Reservoirs, *Pumped storage, *Water temperature, *Model studies, Mathematical models, Computer models, Simulation analysis, Powerplants, Electric powerplants, Rivers, Temperature, Computer programs, Evaluation.

A combination pumped storage reservoir system was simulated by modifying the WRE deep reservoir model. Each of the two reservoirs was described by a copy of the WRE model program, the two programs were converted into subroutines and were called upon alternately by a main program. Operationally, the contributing reservoir, i.e., the reservoir from which flow was discharged, was simulated for one execution interval (1 hour), followed by simulating the receiving reservoir for the same execution interval. The main program directed the discharge temperature of the contributing reservoir for each execution interval as input for simulating the receiving reservoir. The two subroutines were run in this interactive mode for a simulation period of one year. Two simulations, labeled 'Pump' and 'Net', were effected and differed basically in the distribution of flow volumes exchanged between the reservoirs. In the 'Pump' simulation the total hourly flow volumes were distributed into appropriate horizontal layers of the lakes as determined by temperature-density relationships, i.e., the pumped discharges were distributed into the upper lake and the generation discharges were distributed into the lower lake. In the 'Net' simulation only the net daily discharges (daily difference between pump-back and generation at the upper dam), distributed uniformly over 24 hours, were mixed into the horizontal layers of the two lakes. Both simulations produced annual thermal regimes that were apparently within reason for the geographical area and the nature of the input data. However, neither accurately reflected a generalized condition for the reservoirs because the 'Pump' simulation reflected conditions in the forebay and tailrace of the Upper dam while the 'Net' simulation reflected conditions of the remaining parts of the reservoirs. A common problem encountered during regional planning and development of groundwater dependent communities is the difficulty in deciding which areas should be preserved for aquifer recharge purposes. This paper described the development and application of a digital overlay technique for objective evaluation and ranking of potential infiltration and potential recharge areas. Equations were developed which relate the hydrologic parameters pertaining to infiltration and recharge in a surface aquifer-confined aquifer system. These equations make use of discrete data, yet by application in a digital overlay technique results are obtained in the form of spatial distributions in order for regional trends and conditions to be examined. An application of this procedure to the 551,000 acre region of central Florida, known as the Green Swamp, was discussed. The results were presented in the form of computer-generated maps which identify and rank areas of potential recharge to the aquifer system. (Visocky-ISWS)

4C. Effects On Water Of Man's Non-Water Activities

AN OPTIMIZATION TECHNIQUE FOR A MATHEMATICAL URBAN RUNOFF MODEL,
Howard, Needles, Tammen and Bergendoff, Minneapolis, MN.
C. S. Chu, and C. E. Bowers.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 120-128, 1978. 7 Fig, 1 Tab, 16 Ref, 1 Append.

Descriptors: *Optimization, *Model studies, *Urban runoff, Urban hydrology, Mathematical models, Analytical techniques, Infiltration, Hydrographs, Mathematical studies, Computer models.

The purpose of the study was to develop a simple mathematical urban runoff model and, along with it, an automatic optimization technique. The optimization technique can assist the user in determining the 'best' set of input parameters to reproduce an observed hydrograph. A modified Holtan's infiltration equation based on soil moisture content was used to compute the infiltration rate. A simple Soil Conservation Service triangular unit hydrograph procedure was used to obtain the runoff hydrograph. A routing procedure has not, as yet, been included in the model. Seven available optimization techniques were tested in order to select the best optimization technique for the model. It was found that the BOX-COMPLEX method produced consistently good results for five randomly chosen initial starting points. Other 'Gradient' methods did not perform as well. Improvement of BOX-COMPLEX method was attempted by (1) changing the values of coefficients and the number of operations and (2) by adding expansion and shrinkage operations. It was found that the two basic operations, reflection and contraction, with proper coefficient values not only produced good results but also retained the simple structure of the

BOX-COMPLEX method. The reflection and contraction coefficients were 2.0 and 0.5, respectively. The model was applied to the Oakdale Avenue Drainage Basins in Chicago. The agreement between the observed and the calculated hydrographs achieved by the proposed model, for a storm of July 2, 1960, was excellent in both timing and magnitude of the peak flow. SURFACE MINING AND THE HYDROLOGIC BALANCE,
Northeastern Forest Experiment Station, Berea, KY.
W. R. Curtis.
Mining Congress Journal, p 35-40, July 1979. 3 Fig, 3 Tab, 17 Ref.

Descriptors: *Hydrology, *Strip mines, *Peak flow, *Sedimentation, *Erosion, Effects, Storm runoff, Land reclamation, Flow rates, Kentucky, West Virginia, Eastern Kentucky, Southern West Virginia.

Research by the U. S. Forest Service at Berea, Kentucky, has shown that surface mining results in increases in storm peak flows during and immediately after mining, but that peaks may be significantly lower after reclamation is completed. Data from experimental sites in Breathitt County, Kentucky, and Raleigh County, West Virginia, during major rainstorms on 4 April 1977 and 8, 9, and 10 December 1978 showed that streamflow from surface-mined watersheds peaked lower than that from adjacent or nearby unmined watersheds. Impoundments on surface-mine lands can be effective in controlling runoff and erosion provided the ponds are properly constructed. Erosion and subsequent sedimentation are greatest during early stages of mining but diminish rapidly as the land is reclaimed and vegetation growth progresses.

Hydroseeding trials on forest roadside slopes at two Vancouver Island sites showed that a single application of both seed and fertilizer was as effective as sequential application of seed and fertilizer. Mulching proved unnecessary. Untreated plots had no plant cover. Soil eroded to an average depth of 2.3 centimeters between September 1976 and April 1977, an estimated soil loss of 345 cubic meters per kilometer of road. Plant cover on treated plots, which averaged 65%, trapped soil eroded from upslope. (Sims-ISWS)

5A. Identification Of Pollutants

REQUIREMENTS OF STATE REGULATORY AGENCIES FOR MONITORING GROUNDWATER QUALITY AT WASTE DISPOSAL SITES,
Minnesota Pollution Control Agency, Minneapolis.
T. P. Clark, and G. V. Sabel.
Ground Water, Vol 18, No 2, p 168-174, March-April 1980. 1 Fig, 2 Tab, 6 Ref.

Descriptors: *Groundwater, *Water quality, *Waste disposal, *Monitoring, Pollutants, Pollutant identification, Chemicals, Sampling, Surveys, Observation wells, Water pollution, Water pollution control, Law enforcement.

A survey of the requirements of State regulatory agencies responsible for monitoring groundwater quality at waste disposal sites was conducted in order to gain a concise profile of monitoring practices across the country, and also to provide the basis for a monitoring manual to serve as technical background and guidance for the citizens of Minnesota. The survey considered a variety of topics including the regulatory framework for requiring monitoring, chemical parameters analyzed, recommended methods of monitoring well construction and sample collection, laboratory quality control, data interpretation, and postoperational monitoring requirements. The survey showed that most State monitoring programs are in their infancy. Many States, however, are beginning to devote serious effort and manpower commitments to the development of monitoring programs, although there is considerable divergence of opinion regarding how these programs should be conducted. Federal legislation establishing minimum performance criteria instead of detailed operating requirements for waste disposal sites will increase the need for sound water monitoring programs at these sites in the future. HYDROTHERMAL ANALYSES USING COMPUTER MODELING AND FIELD STUDIES,
Tennessee Valley Authority, Norris.
W. R. Waldrop.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 38-43, 1978. 3 Fig, 1 Ref.

Descriptors: *Hydrothermal studies, *Heated water, *Reservoirs, *On-site investigations, *Tennessee, Spatial distribution, Water temperature, Measurement, Model studies, Isotherms, Calibrations, Diffusion, On-site data collections, Analysis.

The procedures employed by TVA for obtaining field data, a brief discussion of the features of a three-dimensional finite-difference model used for simulations, and an example of model verification were presented. Results from the three-dimensional model were needed for an environmental evaluation of the submerged intake and surface discharge of condenser cooling water of the TVA Gallatin Steam Plant in central Tennessee. Prior to using the model to compute flow and temperature patterns under extreme conditions, the model was used to simulate a relatively high flow condition for which field data had been obtained. The comparison of measured and computed isotherms at a depth of 0.15 meters was presented. The results compare quite well in the main channel and are adequate in the shallow region near the right bank. Better agreement could have been achieved in this region by increasing the resolution, but the grid spacing was chosen such that three-fourths of the grid points were placed upstream of the discharge channel to evaluate flows and temperatures in environmentally sensitive areas during very low flows. T. Green, J. A. Hoopes, F. L. Scarpace, J. R. Villemonte, and R. P. Madding.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 44-53, 1978. 1 Tab, 35 Ref.

Descriptors: *Lakes, *Rivers, *Effluents, *Wisconsin, On-site investigations, Water temperature, Turbidity, Spatial distribution, Heated water, Instrumentation, Sewage effluents, Industrial wastes, Remote sensing, Methodology, Reviews, Measurement, Plumes, Thermal plumes.

The University of Wisconsin at Madison has been measuring various aspects of effluent surface plumes into rivers, small lakes, and Great Lakes for over a decade. Some of this work has been aimed at developing measurement techniques, some at eliciting the fluid mechanics of the phenomenon, and some at formulating numerical models either generally applicable or directly applicable to the particular site. This paper is a review of the highlights of that work, together with a fairly complete list of references in which more details of the work can be found. The plumes studied were subdivided by the type of receiving water body, and according to whether the effluent is characterized mainly by its temperature (e.g., the discharged cooling water from a power plant) or by some other property (e.g., the effluent from a paper company). A THREE DIMENSIONAL THERMAL PLUME MODEL,
Cooper Union, New York.
J. C. Cataldo, R. R. Zavesky, and A. S. Goodman.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 54-60, 1978. 2 Fig, 4 Ref.

Descriptors: *Hydrothermal studies, *Reservoirs, *Isotherms, *Model studies, Mathematical models, Heated water, Forecasting, Spatial distribution, Discharge(Water), Water temperature, On-site investigations, Thermal plumes, Three-dimensional plume.

Presently, there are two techniques used to measure plume temperatures: (1) boats with in situ, temperature-sensing instrumentation, and (2) airborne, thermal, infrared, detection instrumentation. The aerial, infrared-monitoring offers a truly synoptic picture of the surface temperature, whereas the boat technique, because of the time needed for measurements, provides a time-distorted picture of the plume. A phenomenological model to predict both surface and subsurface temperatures from given discharge and receiving water characteristics was presented. The only parameters needed for the model are the plant discharge conditions and receiving water characteristics. The model, at this time, is restricted to surface discharges into zero or mild receiving water currents. The procedure may easily be extended to include receiving waters with strong cross-flows when sufficient triaxial, thermal-plume data become available to calibrate the model. A total of 19 triaxial field-surveys from five power plants were used to develop and calibrate the model. (See also W80-05159) (Humphreys-ISWS)

MODIFYING AUTOMATED PUMPING SAMPLERS FOR USE IN SMALL MOUNTAIN STREAMS,
Oregon State Univ., Corvallis. School of Forestry.
R. L. Beschta.
Water Resources Bulletin, Vol 16, No 1, p 137-138, February 1980. 2 Fig.

Descriptors: *Water quality, *Sampling, *Streams, *Equipment, *Oregon, Monitoring, Runoff, Streamflow, Pollutants, Water pollution, Mountains, Sampling equipment, Pumping samplers.

Two modifications to automated pumping samplers improve discrete sampling during high flow events in small mountain streams. One modification entails mounting the intake nozzle on a bent, free-swinging metal rod supported in midstream. This allows sampling in midstream yet prevents the buildup of floatable organic debris that otherwise would cause the intake to fail. On the lower end of the rod, dynamic forces exerted by the stream keep the intake submerged over diverse flow conditions. The second modification consists of a magnetic switching device that automatically activates the pumping sampler at any preset stage on the rising limb of a storm hydrograph. The pumping sampler then remains on to collect one sample per hour which allows field crews sufficient time to change bottles before the sampler fills its 28-bottle capacity. This device improves the capability to sample frequently at fixed intervals, yet with minimal maintenance between runoff events. It also ensures sample collection during the rising limb of the hydrograph when flow and sediment concentrations are rapidly changing. Both modifications have improved data collection during periods of storm runoff. (Sims-ISWS)

USING ARTIFICIAL STREAMS TO EVALUATE PERTURBATION EFFECTS ON AUFWUCHS STRUCTURE AND FUNCTION,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
J. R. Clark, J. H. Rodgers, Jr., K. L. Dickson, and J. Cairns, Jr.
Water Resources Bulletin, Vol 16, No 1, p 100-104, February 1980. 3 Fig, 1 Tab, 30 Ref. DOE E-(40-1)-4939.

Descriptors: *Periphyton, *Biological communities, *Streams, *Laboratory tests, Biomass, Water circulation, Velocity, Flow, Equipment, Facilities, Research facilities, Biology, Ecosystems, *Artificial streams, Perturbation effects.

Artificial streams can assist in assessing the potential impact of pollutants on the structure and function of aquatic communities. While most artificial streams are constructed within a controlled environment or are maintained by recirculating water, the authors constructed a series of artificial streams along a river bank using river water on a once-through basis. This system was used to develop and test methods for structural and functional analyses of Aufwuchs communities. Only the flow rate and stream depth were controlled while individual streams were perturbed to obtain communities of altered ecological condition. This experimental system provided a relatively inexpensive series of treated and untreated streams which allowed an evaluation and comparison of methods using communities under various stressed and nonstressed conditions. Without the stabilizing effects of a controlled atmosphere or recirculating water, the authors' approach demonstrated a degree of variability which approached that of the river. It was inferred that the Aufwuchs community present in the artificial streams maintained a high degree of structural complexity and functional dynamism, providing a strong test of the methods employed and an opportunity to examine current ecological theory. TRANSPLANTING AQUATIC BRYOPHYTES TO ASSESS RIVER POLLUTION,
University Coll., Cardiff (Wales). Dept. of Botany.
K. Benson-Evans, and P. F. Williams.
Journal of Brycology, Vol 9, p 81-91, 1976. 3 Fig, 3 Tab, 19 Ref.

Descriptors: *Rivers, *Mosses, *Water pollution, *Bioindicators, Vegetation effects, Environmental effects, Bioassay, Water pollution effects, Aquatic plants.

Literature dealing with the use of bryophytes for water quality assessment is briefly reviewed. Reasons are presented for the selection of the two bryophyte species, Eurhnchium riparioides and Fontinalis antipyretica, used in transplantation experiments. Results show that the breakdown of the two species, exposed on the river Ebbw Fawr, reflect improvements in water quality both downstream of the main source of pollution as a result of dilution and precipitation of pollutants, and over a period of four years as a result of improved effluent treatments. DATA PROCESSING AND ANALYSIS FROM H-F RADAR DATA OBTAINED IN COOK INLET ALASKA DURING SUMMERS 1977 AND 1978,
National Oceanic and Atmospheric Administration, Rockville, MD. Wave Propagation Lab.
D. E. Barrick, S. Frisch, and R. Weber.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 1-4, 18-114, October 1979. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Data processing, *Radar, *Currents(Water), Baseline studies, Environmental effects, Water pollution, Resources development, Movement, Path of pollutants, Alaska, *Outer Continental Shelf, Gulf of Alaska, Petroleum development.

During the summer of 1977 the H-F Doppler surface current radar system was deployed in lower Cook Inlet, Alaska at Anchor Point and Seldovia. Several time series of data were collected during the deployment period. A representative 24-hour data set has been extensively analyzed. During the summer of 1978, a radar system was successfully operated in western lower Cook Inlet, Alaska, for a period of two weeks. About 8 days of data were collected at this time. The radar sites were located at Cape Douglas and Augustine Island for these experiments. These data have been processed and current vector maps have been plotted and included in this report. A NEW TECHNIQUE FOR MEASURING TIDAL CURRENTS USING A TWO-SITE HF DOPPLER RADAR SYSTEM,
National Oceanic and Atmospheric Administration, Rockville, MD. Wave Propagation Lab.
A. S. Frisch, and B. L. Weber.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 5-17, October 1979. 13 Ref. NOAA, Environmental Research Laboratories, Outer Con-

tinental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Tidal effects, *Radar, *Currents(Water), Offshore platforms, Water pollution effects, Resources development, Environmental effects, Alaska, Oil pollution, Movement, *Outer Continental Shelf, Tidal currents, Nearshore environment, Doppler radar, Gulf of Alaska, Petroleum development.

Surface currents were measured using a newly developed H-F (High Frequency) Doppler radar technique. The system was operated in lower Cook Inlet, Alaska in July, 1977. During one particular day the radar data collected every 30 minutes for 24 hours was analyzed. By least squares fitting these data to two of the dominate tidal periods, 12.31 and 24.6 hours, the spatial distribution of the tidal currents for each of these two periods were determined. In addition, the spatial distribution of the mean surface currents were determined for the 24 hour period. Analysis of the data shows that near Kachemak Bay, there is a distint difference of the east-west component of tidal flow compared to regions further from Kachemak. The results demonstrate the use of H-F radar techniques for resolving spatial and temporal currents which affect the nearshore environment. In those near-shore regions where the tidal currents dominate, the radar measurements, in conjunction with the tidal analysis, actually provides sub-surface currents which are important for stress considerations of off-shore oil platforms. THE INTERACTION OF OIL WITH SEA ICE IN THE ARCTIC OCEAN,
Washington Univ., Seattle. Dept. of Oceanography.
S. Martin.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 171-180, October 1979. 2 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-03-5-022-67.

Descriptors: *Sea ice, *Water pollution effects, *Oil spills, Movement, Environmental effects, Arctic Ocean, Baseline studies, Resources development, Alaska, *Outer Continental Shelf, Petroleum development, Grease ice, Pancake ice.

To understand how spilled oil might interact with the various kinds of ice in the Beaufort, Bering and Chukchi Seas, field traverses were done in these regions with particular emphasis on ice types which have previously not been studied. These include grease and pancake ice in Norton and Kotzebue Sound, and most recently a field investigation of the ice plumes which form at the pack ice edge in the Bering Sea. In the laboratory experiments have been performed on how spilled oil interacts with grease ice, pancake ice, and simulated multi-year ice. (Sinha-OEIS)

DYNAMICS OF NEAR-SHORE ICE,
Cold Regions Research and Engineering Lab., Hanover, NH.
A. Kovacs, and W. Weeks.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 181-207, October 1979. 8 Fig, 3 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-01-5-022-1651.

Descriptors: *Sea ice, *Remote sensing, *Hazards, *Oil spills, *Movement, Engineering, Environmental effects, Baseline studies, Arctic Ocean, Water pollution, *Outer Continental Shelf, Fast ice, Petroleum development.

A knowledge of motion, deformation and physical characteristics of both the near-shore pack ice and the fast ice is essential to adequately designing and estimating the hazards associated with a variety of engineering options that may be considered for offshore operations in the near coastal areas of the Beaufort and Chukchi Seas. The present program contributes directly to the solution of this general class of engineering problems in that it will provide much of the geophysical and engineering data upon which sound engineering and regulatory decisions can be made. Interest in observing and developing methods to predict the drift of pack ice through the Bering Strait is linked to the fact that ice flow through the Straits would be a key mechanism in dispersing an oil spill occurring along the coastal areas of the Beaufort and Chukchi Seas. A remote sensing program provides basic information on the distribution of ice types and features and in particular ridges required as one aspect of a risk analysis for the construction of an offshore drilling platform sited on the edge of the Arctic Ocean. CURRENT MEASUREMENTS IN POSSIBLE DISPERSAL REGIONS OF THE BEAUFORT SEA,
Washington Univ., Seattle. Dept. of Oceanography.
K. Aagaard.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 208-231, October 1979. 7 Fig, 5 Tab. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-03-5-022-67.

Descriptors: *Currents(Water), *Dispersion, *Water pollution, *Ocean circulation, Oil spills, Resources development, Environmental effects, Arctic Ocean, Alaska, *Outer Continental Shelf, Beaufort Sea, Petroleum development.

The objective of this work has been to obtain long-term Eulerian time series of currents at selected locations on the outer shelf of the Beaufort Sea. Such measurements are necessary to describe and understand the circulation on the shelf and the exchange between the shelf and the deep Arctic Ocean. The significance of these results to the dispersion of plankton, pollutants, and substances of geological and biological consequence (below about 60 m) is as follows: (1) Material trajectories will nearly follow isobaths; (2) Over a period anywhere from 1-10 days, displacement may be either eastward or westward, and the magnitude of such displacement can exceed 40 km over 24 hours; (3) On time scales exceeding about one month, the net displacement will be westward, with mean speeds corresponding to typical monthly displacements in the range of 100-250 km; (4) Materials can also move on- and offshore on time scales of a few days. Such movements likely involve vertical displacements of several hundred meters; and (5) The shelf is an energetic and variable environment even in winter. (Sinha-OEIS)

NORTHWEST GULF OF ALASKA SHELF CIRCULATION,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
R. D. Muench, J. D. Schumacher, and R. Sillcox.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 232-248, October 1979. 8 Fig, 1 Tab, 14 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Currents(Water), *Dispersion, *Diffusion, Water pollution effects, Sediment transport, Oil spills, Baseline studies, Resources development, Alaska, Path of pollutants, Water circulation, *Outer Continental Shelf, Gulf of Alaska, Petroleum development.

The objective of this work is to relate oceanic advective and diffusive processes to potential pollution problems due to OCS petroleum development. This is accomplished through field activities including moored current measurements and water mass analysis using temperature and salinity observations. The regions being considered include the northwest Gulf of Alaska continental shelf west from about the longitude of Seward, Alaska to Unimak Pass and extends offshore to the outer boundary of the Alaskan Stream some 100 km off Kodiak Island. This study provides estimates of the fields of water motion which exert primary control over trajectories of spilled oil and over diffusion processes along the trajectories. Oil introduced into the environment via long-term or chronic leakage is more likely to be dispersed throughout the water column and, possibly, scavenged by suspended particulate matter. The problem then becomes one of understanding net transport of suspended matter, a process related to advective and diffusive fields within the water column. Understanding of these processes requires an analysis of the velocity field and its driving mechanisms. (Sinha-OEIS)

BRISTOL BAY OCEANOGRAPHIC PROCESSES (B-BOP),
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
R. L. Charnell, J. D. Schumacher, L. K. Coachman, and T. H. Kinder.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 249-319, October 1979. 27 Fig, 4 Tab, 40 Ref, 2 Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado

Descriptors: *Oceanography, *Currents(Water), *Tidal effects, *Hazards, Oil pollution, Baseline studies, Environmental effects, Water pollution effects, Alaska, Flow, *Outer Continental Shelf, *Bristol Bay(AK), Physical oceanography, Petroleum development.

The current reporting period covers the final experiments specifically conceived to address OCSEAP objectives in Bristol Bay and includes data analysis which will lead to the formulation of a comprehensive understanding of physical oceanographic processes occurring within Bristol Bay. Field efforts during this period were directed toward two objectives: the general nature of flow in Bristol Bay and detailed experiments of the dynamics to two structural fronts and their relation to: (1) the biology of the area and (2) an examination of the velocity field across and along the front. Analysis efforts have continued toward elucidating such phenomena as: fine structure, fronts, tides and tidal currents, eddy circulation off the shelf, and the mean and low frequency flow through the area. These efforts should lead to a reasonable synthesis of the regional physical oceanography, and its influence on the petroleum development hazard assessment. (Sinha-OEIS)
W80-05344

CIRCULATION AND WATER MASSES IN THE GULF OF ALASKA,
Alaska Univ., Fairbanks. Inst. of Marine Science.
T. C. Royer.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 320-383, October 1979. 19 Fig, 1 Tab, 2 Ref, Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-03-5-022-56.

Descriptors: *Oceanography, *Water circulation, *Paths of pollutants, *Oil spills, Environmental effects, Water pollution, Alaska, Resources development, *Outer Continental Shelf, *Gulf of Alaska, Water masses, Petroleum development.

Since the inception of the OCSEAP-NEGOA program, the knowledge of the physical oceanog-

raphy, in particular circulation and water masses, has evolved from the point where the annual cycle was marginally described to some of the physical mechanisms which control the annual cycle. The practical implications of this evolution in the case of OCSEAP is to better predict the shelf circulation and hence the possible trajectories that oil spills would follow. The improved understanding of the physical mechanisms which control the circulation allow predictions to be made from observational periods. The focus has been on mesoscale driving mechanisms in the past year's research. The mechanisms for driving the shelf circulation, such as wind stress, precipitation, runoff, and offshore circulation have been more clearly identified. This has lead to a detailed treatment of winds at Middleton Island and the hydrology for the southcoast region. Abstracts of papers submitted, presented or published are included in this report. W80-05345

NEAR-SHORE METEOROLOGY,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
R. M. Reynolds, S. A. Macklin, and B. A. Walter.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 384-401, October 1979. 2 Fig, 2 Tab. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Weather patterns, *Winds, *Meteorology, Paths of pollutants, Oil pollution, Resources development, Water pollution, Baseline studies, Environmental effects, Alaska, *Outer Continental Shelf, Gulf of Alaska, Wind stress, Petroleum development.

The objective of this study is to define the dominant mesoscale features in four specific coastal regions, Albatross Banks, Kiliuda Bay, Lower Cook Inlet, and Hinchinbrook Entrance. A thorough knowledge of coastal wind conditions is an important ingredient to responsible offshore industrial development. Surface winds strongly affect both mean water circulations and the trajectories of surface contaminants. The work is aimed at defining which processes are active in modifying the wind field along the coast of Alaska, how prevalent they are, and how far offshore they act. All available meteorological data is utilized in developing as complete a description as possible for the four regions. The work is principally a comparison of the observed flow field and larger scale forcing, with some consideration to the energetics of the planetary boundary layer. Both ends of the spectrum are important in such a study due to the juxtaposition of different modifying processes. (Sinha-OEIS)
W80-05346

OBSERVATIONS OF MESOSCALE WINDS IN LOWER COOK INLET, ALASKA - MARCH 1978,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
S. A. Macklin.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 402-433, October 1979. 11 Fig, 2 Tab, 17 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Winds, *Climatology, *Baseline studies, Environmental effects, Water pollution effects, Oil spills, Hazards, Alaska, Resources development, Paths of pollutants, *Outer Continental Shelf, Cook Inlet(AK), Petroleum development.

Surface wind data were collected and analyzed for the lower Cook Inlet region in March 1978. The dominant surface air circulation is due to pressure gradient forcing along two nearly orthogonal orographic channels. As much as 84% of surface air movement observed in lower Cook Inlet can be explained in terms of this flow. Additional mesoscale flows of katabatic and lee wave nature were identified at Kachemak Bay, Cape Douglas and Augustine Island. With the advent of oil exploration in lower Cook Inlet and the accompanying hazard of oil spills, knowledge of Cook Inlet air movement in response to large and small scale meteorological forcing is important. An accurate knowledge of coastal winds is also important in determining shallow water circulation in estuaries and on the continental shelf in charting the distribution of marine larval species and in providing accurate wind information to both aeronautical and marine navigators. (Sinha-OEIS)
W80-05347

THE RESPONSE OF COASTAL WINDS AT ALBATROSS BANKS, LOWER COOK INLET, AND HINCHINBROOK ENTRANCE TO A PASSING SYNOPTIC DISTURBANCE - PRELIMINARY ANALYSIS,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
S. A. Macklin.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 491-504, October 1979. 4 Fig. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Storms, *Winds, *Extratropical cyclones, *Oil spills, Hazards, Paths of pollutants, Resources development, Environmental effects, Water pollution, Alaska, Cook Inlet(AK), *Outer Continental Shelf, Weather conditions, Gulf of Alaska, Petroleum development.

This study relates coastal wind fields in three proposed oil lease and transport areas - lower Cook Inlet, Albatross Banks, and Hinchinbrook Entrance - to the passage of a typical extratropical cyclone. The possibility of inferring winds during an oil spill with such a synoptic scenario is investigated. Surface winds in these three coastal areas are explained in terms of synoptic characteristics of a mid-latitude cyclone. This storm influenced the study regions over the period 11 March to 13 March 1978 as it moved north out of the Pacific Ocean across the Aleutian Islands and into the Bering Sea. Maximum observed surface winds coincided with passage of an occluded front associated with the storm. Coastal winds in lower Cook Inlet and Hinchinbrook Entrance were dominated by orography. Winds over the Albatross Banks were observed to be a direct result of synoptic forcing alone. (Sinha-OEIS)
W80-05348

MODELING OF TIDES AND CIRCULATIONS OF THE BERING SEA,
Rand Corp., Santa Monica, CA.
J. J. Leendertse, and S. K. Liu.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 547-560, October 1979. 9 Fig, 2 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Model studies, *Currents(Water), *Tides, *Paths of pollutants, Oil spills, Water pollution effects, Environmental effects, Baseline studies, Alaska, Resources development, *Outer Continental Shelf, Bristol Bay(AK), Trajectory simulation.

Effort during this reporting period was to carry out modeling investigations for the Bristol Bay - St. George Basin area and for Norton Sound. The final prediction and verification run of the three-dimensional turbulent energy model was completed for the first study area. Bristol Bay is primarily a tide- and wind-driven system with distinctive nonhomogeneous hydrodynamic behavior. The three-dimensional model is required to characterize its response to these driving forces. The computed current field from predicted tides at the open boundary agrees very well with the observed values in the modeled area. Because of the sensitive interactions between density gradient, vertical shear structure and the vertical momentum exchange processes, it is very difficult to separate the wind and tide effects on the circulation. As a consequence, accuracy in tidal current prediction is a prerequisite in predicting surface drift and the pathways of pollutant discharges. For oil-spill trajectory simulation, extensive computation and graphic programs are under development. In order to provide wind input for the simulation, weather statistics from the Norton Sound area are being analyzed. A suitable method will be selected for generating random wind fields according to the local weather statistics. Trade-offs between several possible methods are being studied. (Sinha-OEIS)
W80-05350

COMPARISON BETWEEN GEOSTROPHIC WINDS DERIVED FROM THE STANDARD PRESSURE MEASUREMENT NETWORK AND THE AIDJEX NETWORK,
Washington Univ., Seattle. Polar Science Center.
E. Leavitt.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 46-56, October 1979. 6 Fig, 3 Tab, 6 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Winds, *Ocean currents, *Path of pollutants, Oil spills, Water pollution effects, Resource development, Baseline studies, Environmental effects, Alaska, *Outer Continental shelf, Oil trajectories, Wind direction, Wind speed, Geostrophic wind, Oil-in-ice, Petroleum development.

Studies of ocean current or ice trajectories require specification of the surface air stress. The normal method is to relate the air stress to the geostrophic wind speed calculated from the gradient of the observed surface pressure field. The accuracy of the National Center for Atmospheric Research (NCAR) data set is examined by comparing it to the AIDJEX geostrophic winds and to measurements of surface winds at Point Barrow (BRW), Barter Island (BTI) and the AIDJEX manned camps. The differences reported here should not seriously affect the conclusions about possible mean oil-in-ice trajectories. There are other variables that were not modelled such as ocean currents, that would have a greater influence on the results. The results do indicate a potential problem for studies of ice dynamics because it is the periods at high wind speeds that will be underestimated most severely by an NCAR type data set. Also, although the direction agrees in the mean, there are large random errors in the wind direction that may be important on shorter time scales. (Sinha-OEIS)
W80-05352

NORTON SOUND/CHUKCHI SEA OCEANOGRAPHIC PROCESSES (N-COP),
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
R. D. Muench, J. D. Schumacher, and R. B. Tripp.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 288-309, October 1979. 1 Fig, 2 Tab, 1 Ref, Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf environmental Assessment Program, Boulder, Colorado.

Descriptors: *Ocean circulation, *Tidal effects, *Sediment transport, *Path of pollutants, Oil pollution, Baseline studies, Resources development, Environmental effects, Water pollution effects, Alaska, *Outer Continental Shelf, Nearshore circulation, Bering Sea/Chukchi Sea, Petroleum development.

Continuing analysis of field data obtained during prior years is enhancing understanding of flow in

the northern Bering Sea, particularly with regard to subtidal fluctuations. Five current meter moorings deployed during summer 1978 yielded data which will help clarify both the regional tides and some aspects of subtidal circulation in the region between Norton Sound and St. Lawrence Island. These data are being provided as necessary input to the tidal modelling effort. Further analysis of the existing field data will address regional tidal behavior and propagation/forcing of subtidal flow events through the system. This study will provide estimates of the trajectories likely to be followed by spilled oil and will furnish an indication of dispersion rates for such oil. Oil introduced into the environment via long-term or chronic leakage is more likely to be dispersed throughout the water column and, possibly, scavened by suspended particulate matter. The problem then becomes one of understanding net transport of suspended matter, a process related to the advective and diffusive fields within the water column. An understanding of these processes requires, in turn, analysis of the velocity field and its driving mechanisms. (Sinha-OEIS)
W80-05355

OIL POOLING UNDER SEA ICE,
Cold Regions Research and Engineering Lab., Hanover, NH.
A. Kovacs.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 310-353, October 1979. 3 Fig, 3 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Sea ice, *Ice cover, *Oil spills, *Path of pollutants, Water pollution sources, Environmental effects, Resources development, Arctic, Alaska, Baseline studies, *Outer Continental Shelf, Oil pooling, Petroleum development.

Cross-sectional information on the thickness and bottom relief of sea ice is provided. The subsurface topographic data provide information for determining the direction that oil discharged under fast ice will flow and the quantity of oil which can be expected to pool up within the under-ice relief. The data which have been analyzed to date indicate, as expected, that the cause of the mesoscale relief (5 to 50 cm) found under the fast ice in late winter is due to snow cover variation. In short, where the snow depth is greatest the underlying ice sheet is thinnest due to the insulating effect of the snow, which reduces heat transfer to the atmosphere and therefore ice growth. Studies have shown that where there is a preferred current direction under sea ice the crystal structure of the ice becomes highly ordered. This ordered structure is a complex anisotropic dielectric which was found to be an effective polarizer of transverse electromagnetic waves. Because current effects establish the preferred crystal alignment, the radar signal phenomenon makes it possible to determine the direction of the preferred current under sea ice remotely. Sea ice profiling data from the Tigvariak Island runway site have been partially analyzed and from this information a contour map of a 150-m long section of the profiled runway was made. The profile information shows the strong effect of snow cover variation on under-ice relief and therefore oil pooling potential. (Sinha-OEIS)

THE TRANSPORT AND BEHAVIOR OF OIL SPILLED IN AND UNDER SEA ICE,
Flow Research Co., Kent, WA.
M. D. Coon, and R. S. Pritchard.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 354-360, October 1979. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Sea ice, *Path of pollutants, *Ice cover, *Water pollution effects, *Oil spills, Baseline studies, Resources development, Environmental effects, Alaska, *Outer Continental Shelf, Prudhoe Bay, Petroleum development.

The objective of this work is to determine the locations to which oil spilled in or under the ice cover near Prudhoe Bay, Alaska, would be transported, and to determine the behavior of the oil as the ice cover moves and deforms. To determine the most likely and extreme sea ice motions, the barometric pressure fields, as determined by the U.S. Weather Service for twenty-five years, were used to determine the winds and, through a sea ice dynamics model, the subsequent sea ice motion. The breakout of the sea ice from the Beaufort to the Chukchi Seas was studied using a rigid plastic model for the behavior of the sea ice to determine the meteorological conditions under which breakout may occur. Studies of the possible fate of oil spilled in the Prudhoe Bay area can provide for a move environmentally safe exploration and development of possible off-shore oil. (Sinha-OEIS)

In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 361-469, October 1979. 28 Fig, 1 Tab, 34 Ref, 4 Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Ice cover, *Path of pollutants, *Oil spills, *Currents(Water), *Wind, Water pollution, Arctic, Resources development, Exploration, Baseline studies, Environmental effects, Weather, *Outer Continental Shelf, *Ice trajectories, Beaufort Sea, Chukchi Sea, Petroleum development.

The petroleum industry's anticipated exploration for oil deposits off the north coast of Alaska will involve many new environmental considerations. In addition to the hazards due to the ice, the generally hostile environment will tend to magnify the chances of an oil spill due to other accidents. Once an oil spill occurs, for whatever reason, the ice cover will play a major role in the behavior of the oil. There are many facets to this role: dispersion of the oil under and around the ice, incorporation of the oil into the ice and the eventual release of that oil, the transport of oil trapped in the ice and prevention or enhancement of cleanup. The purpose of this work is to define the range of motions that might be expected for oil spilled on ice during the lifetime of Prudhoe Bay oil fields. It is generally accepted that the primary driving forces of the ice cover are the winds and currents. It is also expected that the ice conditions (i.e., the 'strength' of the ice cover) can have a dominant influence on how the ice behaves in response to these driving forces. Tracking of an actual oil spill requires wind and current observations and prediction at a particular time as well as day to day use of an ice dynamics model to predict motion due to these winds and currents, not a statistical history. The results are presented in graphical form with monthly mean free drift ice motion fields and plots showing temporal and spatial variability. (Sinha-OEIS)

BEAUFORT AND CHUKCHI SEA ICE MOTION. PART 2: ONSET OF LARGE SCALE CHUKCHI SEA ICE BREAKOUT,
Flow Research Co., Kent, WA.
R. W. Reimer, R. S. Pritchard, and M. D. Coon.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 470-494, October 1979. 9 Fig, 7 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Ice cover, *Path of pollutants, *Sea ice, *Model studies, Flow, Oil spills, Environmental effects, Resources development, Water pollution, Baseline studies, Alaska, *Outer Continental Shelf, *Ice flow, Bering Strait, Petroleum development.

The period of time during which sea ice is present in the Bering Strait region extends, in general, from mid-November to late June. During this time the ice pack undergoes numerous deformation cycles which at times are extensive enough to cause large scale flow of pack ice south through the Strait. Evidence taken from satellite images of the area indicates that this phenomenon is likely to occur at least once every winter. In order to understand when and why this occurs, it is necessary to learn which material properties of the ice pack control such breakout, as well as to understand the physical environment which influences the ice pack. Sea ice responds to the influence of the atmosphere and ocean, as well as to the surrounding ice pack. If the material response of the ice is assumed to be rigid-perfectly plastic then it becomes possible to obtain some analytic solutions to the response of sea ice under various loads. This is the approach used to model ice breakout through the Bering Strait. Three models of ice flow through the Bering Strait are presented. They model failure by boundary tractions, body forces, or combinations thereof. All three models are able to predict the winds required to cause breakout. (Sinha-OEIS)

ICE BREAKOUT IN THE BERING STRAIT,
Washington Univ., Seattle. Dept. of Aeronautics and Astronautics.
R. W. Reimer.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investiators for year ending March 1979. Vol VIII, Transport, p 495-564, October 1979. 8 Fig, 9 Ref, 2 Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Sea ice, *Path of pollutants, *Wind, *Flow, Oil spills, Model studies, Baseline studies, Environmental effects, Resources development, Alaska, *Outer Continental Shelf, *Bering Strait, *Ice flow, Petroleum development.

A rigid-plastic sea ice model developed by the AIDJEX modeling group is used to determine when large-scale ice flow may occur through the Bering Strait. Prediction of failure of an ice arch across the Strait is made in terms of a boundary traction which is related to the strength of winds blowing across the ice pack. The method of solution is to parameterize a wedge-shaped region in the Bering Strait and to model the ice pack in this region as a rigid-plastic material. The choice of a region is based on a visual study of satellite photographs of actual breakout occurrences. A boundary value problem is defined in terms of approximate stress and velocity boundary conditions. Using Prager's theorems on limit analysis, it is shown that an upper and lower bound on a failure load can be calculated if the stresses are assumed constant within subregions of the modeled region. By picking a stress state associated with a kinematically admissible velocity field, a unique failure load is calculated. It is found that for the Bering Strait the failure load is independent of the depth of the modeled region. A simple calculation shows that a wind creating a stress of 0.5 Pa requires a fetch of 200 km to cause breakout. The usefulness of the solution depends primarily on the accuracy of the stress boundary conditions which define the problem. (Sinha-OEIS)

ARCTIC OIL SPILL SCENARIOS - OUTLINE,
Flow Research Co., Kent, WA.
M. D. Coon.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 565-569, October 1979. 2 Fig. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Sea ice, *Path of pollutants, *Ocean circulation, Movement, Oil spills, Arctic, Water pollution, Environmental effects, Baseline studies, Resources development, Alaska, *Outer Continental Shelf, *Oil entrapment, Prudhoe Bay, Petroleum development.

Scenarios for twelve conditions will be considered. The conditions will include three separate ice configurations, two different times of year, and two different release volumes. The purpose of this scenario set is to determine the possible fate of oil released into the sea ice in the Prudhe Bay region. The behavior of oil released in the Arctic environment is quite different from the behavior in more temperate climates. The sea ice can act as a natural containment device reducing the areal coverage of a given volume of oil. However, when oil has been entrapped in sea ice, it can remain entrapped for many months before being released to ocean/atmospheric environment or clean up. During the period that the oil is in the ice, it can be transported long distances by the motion of the ice pack. The studies required to understand the spreading of oil beneath sea ice and its subsequent entrapment and transportation by the sea ice are now being conducted. Therefore, at this point only a broad outline of the scenarios can be presented. (Sinha-OEIS)

THE TRANSPORT AND BEHAVIOR OF OIL SPILLED IN AND UNDER SEA ICE - TASK 1,
ARCTEC, Inc., Columbia, MD.
L. A. Schultz, and J. C. Cox.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 570-588, October 1979. 8 Fig, 9 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-03-78-B01-62.

Descriptors: *Oil spills, *Sea ice, *Movement, Ice cover, Path of pollutants, Baseline studies, Resources development, Water pollution effects, Environmental effects, Alaska, Water pollution, *Outer Continental Shelf, Beaufort Sea, Chukchi Sea, Oil transport.

This study addresses four basic spill related phenomena, slick thickness, the motion of oil beneath smooth ice and ice having small roughness features, the motion of oil beneath ice having large roughness features, and the vertical migration of oil in ice. The purpose of this study is to examine how oil from a spill will interact with the sea ice of the Beaufort and Chukchi Seas. The scope of the problem encompasses both the horizontal movement and the vertical migration of oil. The horizontal transport of oil has been studied in an ice covered laboratory flume. Conclusions on the vertical migration of oil in ice are based on observations made during both field and laboratory experiments. The results of these oil-ice interaction studies will be incorporated into the AIDJEX model of ice dynamics to provide a means for predicting the ultimate fate of oil spilled in ice infested waters. 5B. Sources Of Pollution

NITROGEN FERTILIZER MANAGEMENT OF VIGOROUS LEMONS AND NITRATE-POLLUTION POTENTIAL OF GROUNDWATER,
California Univ., Riverside. Dept. of Botany and Plant Sciences.
T. W. Embleton, C. O. Pallares, W. W. Jones, L. L. Summers, and M. Matsumura.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-183510, Price codes: A03 in paper copy, A01 in microfiche. California Water Resources Center, University of California, Davis Technical Completion Report, Contribution 182, December 1979. 29 p, 11 Fig, 15 Tab. (California Water Resources Project UCAL-WRC-W-500). OWRT-A-057-CAL(2).

Descriptors: Citrus fruits, *Lemons, Oranges, Fruit crops, Crop production, *Nitrogen, Nitrification, *Nitrogen fixing bacteria, *Nitrates, *Ureas, *Fertilizers, *Foliar application, Groundwater, *Water pollution, Leaching.

The mission of this project was to develop practical citrus nitrogen fertilizer management programs that would reduce nitrate-pollution potential without having adverse effects on fruit yield, size, and quality. Studies were conducted on 'Washington' navel orange and 'Limoneira 8a Lisbon' lemon. Supplying the trees' nitrogen needs by means of urea foliar sprays resulted in a lower nitrate-pollution potential than by applying nitrogen fertilizer to the soil. An increase in the annual soil-applied nitrogen rate was associated with an increase in the nitrate-pollution potential. November applied nitrogen treatments to lemons were associated with a higher nitrate-pollution potential than the same annual nitrogen rate applied in March, or in a split application. Experimental treatments to lemons did not influence drainage volumes (the amount of water passing below the rootzone annually). Nitrogen leach was not significantly correlated with drainage volume. Very highly significant linear correlations were observed for the following: Nitrogen leached vs. nitrogen rate, nitrogen leached vs. nitrate-nitrogen concentration in drainage water, and nitrate-nitrogen concentrations in drainage water vs. nitrogen rate. An increase in soil-applied nitrogen rate to lemons increased the amount of nitrogen removed in the harvested crop. For a given annual nitrogen rate, foliar-applied treatments were associated with a substantially greater amount of nitrogen removed in the harvested crop than were the soil-applied treatments. INFLUENCE OF REGOLITH PROPERTIES ON MIGRATION OF SEPTIC TANK EFFLUENT,
University of South Florida, Tampa. Dept. of Geology.
R. A. Rea, and S. B. Upchurch.
Ground Water, Vol 18, No 2, p 118-125, March-April 1980. 6 Fig, 1 Tab, 28 Ref.

Descriptors: *Septic tanks, *Groundwater, *Path of pollutants, *Groundwater movement, *Regolith, Nutrients, Pollutants, Nitrates, Chlorides, Phosphorus, Hydrogen ion concentration, Soils, Soil water, Adsorption, On-site investigations, Sampling, Chemical analysis, Mathematical models, Hydrogeology, Hydrology, Soil adsorption.

An investigation of waste-migration patterns from a septic system indicated that complex patterns result from minor variations in regolith adsorptive capacity and texture, local hydrology, and possibly soil microbiology. The existence of multichemical, bifurcating plumes suggested that monitor wells arranged up and downgradient and capable of multilevel sampling are essential to adequately delineate contaminant migration in groundwater. The data also indicated that sampling for a single constituent could yield misleading information about the nature and distribution of other groundwater contaminants. The ability for chemical removal by the regolith is in direct response to minor variations in silt- and clay-sized particle content and corresponds to Langmuir adsorption isotherms. Silt- and clay-sized particles are dominantly organic in origin. Minor iron and aluminum hydroxyoxides and clays are present. Substrate samples, when collected at regular intervals and analyzed for adsorbed constituents and textural variability, provided an integrated picture of the distribution of waste chemicals through time. Such samples also provided insight into the mechanics of plume configuration and flow characteristics within the regolith. The study showed that regolith adsorption data are essential to the determination of life expectancy of the regolith as a contaminant treatment system. (Sims-ISWS)

REACTOR-RELEASED RADIONUCLIDES AND FINE-GRAINED SEDIMENT TRANSPORT AND ACCUMULATION PATTERNS IN BARNEGAT BAY, NEW JERSEY AND ADJACENT SHELF WATERS,
Lamont-Doherty Geological Observatory, Palisades, NY.
C. R. Olsen, P. E. Biscaye, H. J. Simpson, R. M. Trier, and N. Kostyk.
Estuarine and Coastal Marine Science, Vol 10, No 2, p 119-142, February 1980. 5 Fig, 7 Tab, 27 Ref. ERDA EY-76-S-02-2185, EY-76-S-02-2529.

Descriptors: *Radioisotopes, *Nuclear powerplants, *Fallout, *Sediments, *New Jersey, On-site investigations, Sampling, Coasts, Bays, Continental shelf, Water pollution, Water pollution sources, Sediment transport, Spatial distribution, Temporal distribution, Cobalt radioisotopes, Cesium, Pollutants, Path of pollutants.

Anthropogenic radionuclides have been introduced into the Barnegat Bay environment via global fallout from nuclear weapons testing and by low-level discharges from the Oyster Creek Nuclear Generating Station. A significant portion of these radionuclides have been adsorbed to fine-grained particles and consequently provide excellent tracers for fine-sediment transport and accumulation patterns in the Bay and adjacent shelf environment. Fine-grained particles tagged with reactor nuclides are presently accumulating along the landward shore of Barnegat Bay at rates between 1 and 7 cm/year. There is some indication that reactor-tagged sediments are also being transported into the mouths of small tributaries which discharge into the Bay. Reactor-tagged particles that escape from the Bay, through Barnegat Inlet, onto the shelf, are accumulating during the summer with fine-grained material from other sources, in depressions along the shelf bottom. These near-shore mud deposits are apparently resuspended and dispersed by major storms probably on a seasonal basis. By comparing radionuclide ratios in the reactor releases with the ratios observed in the fine-grained sediments in the vicinity of the reactor, it appears that (1) 35% to 50% of the total 137Cs activity in the top 30 cm of the sediments in Oyster Creek is attributable to reactor releases; (2) if transuranic releases have occurred from the Oyster Creek Reactor, the increments of 239, 240Pu and 238Pu are not distinguishable from the fallout plutonium burden in the sediments; and (3) radiocobalt is removed from the liquid effluent and stored in the sediments at least 20 X more effectively than radiocesium. COMPARATIVE NUTRIENT DYNAMICS OF A MARSH-MUDFLAT ECOSYSTEM,
Connecticut Univ., Groton. Marine Sciences Inst.
B. L. Welsh.
Estuarine and Coastal Marine Sciences, Vol 10, No 2, p 143-164, February 1980. 9 Fig, 6 Tab, 39 Ref. Army DACW 33-75-C-0059.

Descriptors: *Nutrients, *Water chemistry, *Rivers, *Estuaries, *New England, Tidal waters, Coasts, Marshes, Salt marshes, Sampling, Surveys, Nitrates, Nitrites, Ammonia, Phosphates, Tides, Tidal effects, Circulation, Water circulation, Pollutants, Water pollution, Path of pollutants.

An open marsh front, its adjacent mudflat, and a dredged channel in the Branford River estuary on the north shore of Long Island Sound were compared to determine their individual contributions to nutrient dynamics in the overall system, to identify mechanisms involved, and to evaluate whether open-system dynamics agreed with those reported for closed systems. Basic patterns of nutrient flux differed between areas, between tidal phases, and between summer and fall. The relative magnitudes of nutrient activity generally were: ammonia greater than phosphate greater than nitrate greater than

nitrite, regardless of area, tide, or season. The channel consistently exported materials. The marsh was heterotrophic with respect to tidal water, removing oxygen and releasing large quantities of phosphate and ammonia, especially during summer months. The mudflat was autotrophic during the day, recharging passing waters with oxygen and effectively removing the pulses of nutrients released from the marsh. Both marsh and mudflat strongly conserved nitrate. Nutrient removal over the mudflat was due to uptake by geochemical or biological activity of the sediments and to the macrophyte, Ulva latuca. During its growing season, Ulva was suspended by tides which increased its area of contact with passing water 6-20 times that of the underlying mudflat surface and added a third dimension to the epibenthic component. The flood tide physically entrained mudflat surface sediments and their associated high-nutrient pore waters, which increased nutrient concentrations in the water column. Through removal on the ebb and recharge on the flood, a steep gradient was maintained between marsh and channel, especially during summer when Long Island Sound water was most nutrient depleted and represented a potential leaching stress. FIELD AND MODEL RESULTS FOR MULTIPORT DIFFUSER PLUME,
Tennessee Valley Authority, Norris.
C. W. Almquist, C. D. Ungate, and W. R. Waldrop.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 27-37, 1978. 6 Fig, 6 Ref.

Descriptors: *Model studies, *Hydraulic structures, *Heated water, *Reservoirs, Mathematical models, On-site investigations, Diffusion, Water temperature, Spatial distribution, Analysis, Analytical techniques, Currents(Water), Velocity, Thermal plume, Multiport diffuser.

The three-unit Browns Ferry Nuclear Plant of the Tennessee Valley Authority (TVA) has a net generating capacity of 3456 MW. Condenser cooling water from this plant is discharged into Wheeler Reservoir through a submerged multiport diffuser at temperature rises of up to 25F. Alabama water quality standards limit the plant-induced mixed temperature rise in the reservoir to 5F. Because the plant may operate either with or without cooling towers, the ability to predict accurately plant-induced temperature rises has a direct bearing on plant efficiency. In this paper, an analytical model for predicting the plant-induced temperature rise was presented, and results from a field study under controlled conditions were discussed and compared with model predictions. Field data collection programs should be designed so as to best take advantage of available techniques for data analysis. In this respect, large area, multidimensional contour maps may not be as useful as measurements at fixed points or over a smaller area of the temperature field. This should be taken into consideration in the design of field tests. Analytical and empirical models of diffuser performance offer a relatively simple means of adequately predicting many aspects of diffuser performance. The reasonable agreement of the very simple model with observed temperatures has provided the impetus for the development of a more general, comprehensive model of diffuser performance. AN ANALYSIS OF TOTAL PHOSPHORUS TRANSPORT IN RIVER SYSTEMS,
West Virginia Univ., Morgantown.
F. H. Verhoff, D. A. Melfi, and S. M. Yaksich.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 147-155, 1978. 6 Fig, 5 Ref.

Descriptors: *River systems, *Water quality, *Model studies, *Ohio, Phosphorus, Analytical techniques, Analysis, Mathematical models, On-site data collections, Hydrographs, Distance, Phosphorus transport, Mass balance, Chemograph.

Two views of phosphorus transport during storms can be summarized as follows. The continuous flow theory envisions the total phosphorus as being washed from the land, through the river system, and into the receiving water body during one storm event. The discontinuous theory would propose that the phosphorus is moved from the land and through the stream by a series of flood waves. The first wave would carry the material from the land into the river bed. The second wave would pick up the total phosphorus, carry it some distance, and redeposit it in the river again. This process would continue until the total phosphorus reaches the receiving water body. The first section of this paper involved mathematical modeling which demonstrated that total phosphorus was transported by a resuspension-deposition process. The second section contains a methodology for calculating the net distance of travel for total phosphorus during a storm event. The last section uses the fact of increasing concentration with increasing flow to develop our total phosphorus flux estimating technique. The modeling indicates that total phosphorus is transported by a resuspension-deposition process. The distance of travel was calculated from information at a point in a river. During large storms, most of the total phosphorus passing mainstem stations reaches Lake Erie. The total phosphorus flux entering the lake was estimated at USGS gaging station by a flow interval method. (See also W80-05159) (Humphreys-ISWS)

In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 326-334, 1978. 3 Fig, 3 Ref.

Descriptors: *Cooling water, *Thermal pollution, *Lake Michigan, *Model studies, Hydraulic models, On-site investigations, Calibrations, Heated water, Discharge(Water), Temperature, Water temperature, Powerplants, Water circulation, Currents(Water), Lakes.

Hydraulic models are frequently used to predict temperature rise patterns produced by heated discharges from steam-electric stations. Although considerable progress has been made in analytic techniques in recent years, no reliable analysis was available to predict the dilution of buoyant effluent discharged at relatively high velocity from two submerged and adjacent slots in shallow water. Complex flow interactions and boundary effects prompted the use of a physical model to develop a discharge concept for the Donald C. Cook Nuclear Plant on Lake Michigan such that the thermal plume would meet applicable temperature rise criteria. Subsequent to the start-up of Unit 1 of the two unit plant, an extensive field monitoring program was supported to check compliance with thermal regulations. A few of the numerous thermal plumes were gathered under ambient lake conditions similar to those used in the physical model, and a model-field comparison was, therefore, possible. When wastes are introduced to a natural water body, they are, in general, subject to the coupled influence of hydrodynamic transport processes and biochemical reaction processes. The former, mainly depending on flow circulation, includes advection, mixing, and dispersion of the constituents of the wastes, while the latter, which leads to production or decay or transformation of the constituents through biochemical interaction, depends on both the biochemical characteristics of the constituents of the wastes and the hydrodynamic behavior of the water body. The purpose of this work was to develop a real-time, two-dimensional, depth-integrated mathematical model, which depicts a hydrodynamic and biochemical water quality system to predict flow circulation, water elevation, and water quality response in a natural water body such as river, estuary, or sea. WATER QUALITY MODELING USING HYDROCOMP SIMULATION PROGRAMMING (HSP),
Hydrocomp, Inc., Palo Alto, CA.
R. G. Bourne, G. N. Day, and T. N. Debo.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 358-362, 1978. 1 Fig.

Descriptors: *Water quality, *Rivers, *Model studies, Mathematical models, Calibrations, Flow, Streamflow, Chemicals, Pollutants, Oxygen, Dissolved oxygen, Bacteria, Nutrients, Water temperature, Solar radiation, Winds, Humidity, Hydrology.

Hydrocomp Simulation Programming (HSP) is a mathematical model capable of continuously simulating the hydrologic and water quality responses of a watershed. Continuous simulation essentially refers to use of long-term precipitation records to generate long-term flows. From the flows, the dynamic processes controlling water quality can be simulated for extended periods. The basic philosophy undergirding the simulation of water quality (using HSP) is that hydrology is a major mechanism controlling critical situations, assimilative capacity, and many other water quality processes.

From the long-term simulation of water quality, probabilities of a particular event can be determined. For example, the percent of time DO falls below 5 mg/l can be estimated. The model incorporates many of the basic physical, chemical, and biological processes controlling water quality and can include factors which impact it (e.g., point and nonpoint loads). However, only as much confidence can be placed in simulation results as can be placed in the data base used for calibration and verification. (See also W80-05159) (Sims-ISWS)

CALIBRATION OF URBAN NONPOINT POLLUTION LOADING MODELS,
Northern Virginia Planning District Commission, Falls Church.
J. P. Hartigan, A. M. Lumb, J. T. Smullen, T. J. Grizzard, and P. A. Alcivar.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 363-372, 1978. 3 Tab, 14 Ref, 1 Append.

Descriptors: *Water pollution sources, *Urban runoff, *Model studies, Mathematical models, Cities, Pollutants, Water pollution, Path of pollutants, Monitoring, Chemical oxygen demand, Lead, Zinc, Phosphorus, Nitrogen, Land use, Runoff, Hydrology, Calibrations, Nonpoint water pollution sources.

Recent studies have begun to quantify the magnitude of pollution loadings from nonpoint sources and to question water quality management strategies founded solely on point source abatement. In order to evaluate trade-offs between point and nonpoint pollution control strategies for an urban area, existing and projected nonpoint pollution loadings must be characterized. Such characterizations are generally based on applications of mathematical models that utilize relationships between land use characteristics and the timing and magnitude of runoff pollution releases. Useful relationships between point source pollution loadings and land use (i.e., population equivalents) are readily available in standard reference texts. Appropriate relationships between nonpoint pollution loadings and urban and rural-agricultural land uses are not so readily available. This paper described the use of continuous simulation model calibration techniques to derive 'urban land use-nonpoint pollution' correlations for subsequent model applications in mixed land use watersheds. Major elements in a runoff pollution field study that produced the required model calibration data were summarized. Hydrology and water quality calibration results were presented. Simulated unit area loading rates from the pervious and impervious fractions of urban land uses were compared. (See also W80-05159) (Sims-ISWS)

MODEL VERIFICATION USING THE PLUG-FLOW TECHNIQUE,
Battelle Pacific Northwest Labs., Richland, WA. Water and Land Resource Dept.
S. M. Brown, and A. Brandstetter.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 373-380, 1978. 7 Fig, 2 Ref, 1 Append.

Descriptors: *Rivers, *Path of pollutants, *Flow, *Model studies, Mathematical models, Calibrations, Water quality, Nutrients, Algae, Water temperature, Chemicals, Dissolved oxygen, Hydrology, Plug-flow technique.

A unique approach to steady-state river water quality modeling has been found to be especially useful in the model calibration/verification process. This approach, known as the plug-flow technique, involves the routing of a hypothetical plug of water through successive river reaches according to flow travel time. This routing procedure makes it possible to incorporate the effects of certain time-varying water quality factors, such as algal photosynthesis/respiration, water temperature, waste loads, and tributary inflows, into the simulation structure of a steady-state model. Model calibration and verification using this approach requires water quality data which are functionally related to river travel time. In support of a 208 Areawide Waste Management Planning Study, the plug-flow technique was used to calibrate and verify a steady-state model which simulates the important water quality phenomena affecting dissolved oxygen changes in rivers, including the effects of waste loads, nutrient cycling, algal activity, and water temperature. Approximately 50 miles of the Chemung River system in New York, including the lower Cohocton River and seven municipal and industrial waste sources, were modeled. In addition to model verification, the plug-flow approach proved to be extremely valuable in waste-load allocation studies where both minimum and average daily dissolved oxygen concentrations had to be simulated for comparison with the New York State water quality standards. PLANNING IMPLICATIONS OF WASTE-LOAD ASSIMILATIVE CAPACITY OF COLEMAN CREEK AND FLAT CREEK, MECKLENBURG COUNTY, VIRGINIA,
Virginia State Water Control Board, Richmond. Piedmont Regional Office.
C. T. Bathala, K. C. Das, and W. D. Jones.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 472-482, 1978. 4 Fig, 2 Tab, 6 Ref.

Descriptors: *Water quality, *Water pollution, *Path of pollutants, *Model studies, *Virginia, Mathematical models, Planning, Water pollution sources, Dispersion, On-site data collections, Calibrations, Pollutants, Biochemical oxygen demand, Dissolved oxygen, Nitrogen, Effluents, Water temperature, Streams, Streamflow.

This paper summarized the results of waste-load assimilation analyses of Coleman Creek at Boydton and Flat Creek near South Hill, Virginia, and the possible impact on these communities. Coleman Creek and Flat Creek are two small, free-flowing streams in the South Piedmont Region of Virginia. The assimilative capacity of each stream was analyzed by using modified Streeter-Phelps methodology, a water quality model for self-purification of small streams. Each model was calibrated and verified using two different sets of field data. Based on the results of these studies, it became apparent that very stringent effluent limits, overtaxing the financial capabilities of these communities, would be needed to maintain the existing stream DO standards. A STOCHASTIC-DYNAMIC APPROACH TO THE FOUNDATIONS OF SOLUTE TRANSPORT IN POROUS MEDIA,
Mississippi Univ., University. Dept. of Civil Engineering.
V. K. Gupta, R. N. Bhattacharya, and G. Sposito.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 621-629, 1978. 26 Ref.

Descriptors: *Porous media, *Solutes, *Movement, *Theoretical analysis, Mathematical models, Water quality, Analytical techniques, Analysis, Stochastic processes, Statistical methods, Flow, Mathematical studies, Solute transport.

The authors developed a stochastic theory explicitly based on dynamic considerations. Since the dynamics were specified at the molecular level, the theory did not require that a hydrodynamic description be applicable at the 'pore level.' This fact also enabled the authors to avoid making restrictive and artificial assumptions on the geometry of a porous medium. (See also W80-05159) (Humphreys-ISWS)

STOCHASTIC WATER QUALITY MODEL,
Auburn Univ., AL. Dept. of Civil Engineering.
L. C. Bell.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 638-644, 1978. 2 Fig, 1 Tab, 5 Ref.

Descriptors: *Water quality, *Mathematical models, *Stochastic processes, *Oxygen sag, Statistical methods, Model studies, Dissolved oxygen, Statistical models, Analytical techniques, Monte Carlo method, Streamflow, On-site investigations, Model verification.

The stochastic water quality model DOSIM was developed to provide water quality planners with a more realistic oxygen sag analysis of small streams without the added expense of an expanded data base. The familiar Streeter-Phelps oxygen sag equation with a suitable modification for nitrification was selected as a basic mathematical equation. Monte Carlo methods were employed to generate downstream dissolved oxygen histograms from input data in the form of histograms, probability density functions, or constant values. In this study historical data supplied by the state regulatory agency was inadequate for validation purposes because of the large time span involved and the resulting wide variation in flow and runoff parameters. A carefully controlled monitoring of a local stream during the late summer months did, however, produce data compatible with model assumptions, and validity was ascertained using the nonparametric Kolmogorov-Smirnov test. Three isolates of Escherichia coli were labeled by their resistance to sodium azide and, separately, to novobiocin, nalidixic acid, and tetracycline. The strains exhibited a high degree of persistence in the soil environment and were recoverable on strain specific media at levels within the 95% confidence interval of the numbers covered on nonselective media. The E. coli strains were subsequently used to evaluate the events which would occur when a septic tank drainfield became submerged in a perched water table and effluent-borne bacteria escaped into the groundwater. Field experiments were conducted by introducing the strains into horizontal lines installed into the A, B, and C horizons of a soil profile, and transport was evaluated by collecting groundwater samples from 5 rows of piezometers (sampling 6 separate depth zones/row) located downslope from the injection lines. The major portion of subsurface transport of the bacterial populations occurred in specific zones in the soil profile and at an apparent maximum velocity of 17.0 cm/min. The maximum bacterial density in the groundwater, observed at each sampling distance downslope, was used to produce a mathematical relationship which described the overall decrease in numbers of organisms with increased distance through the soil. The potential health hazards which could occur by the subsurface transport of fecal organisms in relation to these experiments were discussed. (Visocky-ISWS)

WATER QUALITY MODELING IN THE UPPER REACHES OF THE CHOWAN RIVER,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
D. N. Contractor, and P. H. King.
Water Resources Bulletin, Vol 16, No 1, p 118-126, February 1980. 10 Fig, 1 Tab, 14 Ref. OWRT B-074-VA(2).

Descriptors: *Water quality, *Rivers, *Algae, *Model studies, Mathematical models, Nutrients, Pollutants, Water pollution, Path of pollutants, Biochemical oxygen demand, Chemical oxygen demand, Dissolved oxygen, Nitrogen, Nitrogen compounds, River flow, Streamflow, Hydrology, *Chowan River(VA-NC).

The Chowan River system consists of three rivers in southeast Virginia that form two confluences before flowing into Albermarle Sound in North Carolina. A computer program was written to simulate flows through the river system to determine flow rates, velocities, and depths. The output of the flow program was input into a second program that calculated the concentrations of BOD5, COD, DO, and four nitrogen parameters (organic, ammonia, nitrite-nitrate, and algal-N). Measured field data were used to calibrate the model. The effect of reducing the concentration of nutrients from overland runoff on algal concentrations at the mouth of the river was studied. The program was also run to simulate the water quality of the watershed in a primitive condition, in which the watershed was assumed to consist only of forests. The results of the computer program indicate that the major changes in the water quality of the river are simulated satisfactorily. The program can be used to assess the impact of any management scheme to improve water quality. (Sims-ISWS)

DISSOLVED OXYGEN IN INTRAGRAVEL WATER OF THREE TRIBUTARIES TO REDWOOD CREEK, HUMBOLDT COUNTY, CALIFORNIA,
Geological Survey, Helena, MT.
P. F. Woods.
Water Resources Bulletin, Vol 16, No 1, p 105-111. February 1980. 4 Fig, 4 Tab, 22 Ref.

Descriptors: *Dissolved oxygen, *Streams, *Gravels, *California, Tributaries, Forestry, Lumbering, Water quality, Oxygen, Sampling, On-site investigations, Fish, Salmon, Fish eggs, *Intragravel water, *Redwood Creek(CA), *Redwood National Park(CA).

As part of a study of Redwood National Park in northwestern California, an investigation was conducted from June to November 1974 on intragravel dissolved oxygen and sediment in three tributaries to Redwood Creek, a major coastal stream that flows through Redwood National Park. Of concern was whether the intragravel environment of streams in logged and unlogged redwood-forested drainage basins was different. The tributary in the unlogged drainage basin had lower percentages of fine streambed sediment than either of the tributaries in logged drainage basins. Concentration and percentage saturation of dissolved oxygen of intragravel water were highest in the stream in the unlogged drainage basin, intermediate in the stream in the patch-cut drainage basin, and lowest in the stream in the clear-cut drainage basin. The differences in intragravel dissolved-oxygen conditions among the three tributaries are attributed chiefly to differences in their interchange of surface and intragravel water. The larger quantities of fine streambed sediment in the two streams in logged basins may have reduced the permeability of the streambeds and hence their capacity to interchange surface and intragravel water. However, differences in the lithology of the three tributary drainage basins examined may contribute to the differences in the percentage of fine sediments observed among the streams, even in the absence of logging. Knowledge of coliform transport and disappearance may provide information for project design and operation that minimizes potential water quality problems such as the violation of body contact recreation standards. Storm events were sampled in the Caddo River above DeGray Reservoir, Arkansas, and then tracked through the reservoir using the increased turbidity associated with the storm flows. Fecal coliforms were sampled both in the river and throughout the water column in the reservoir. In general, increased fecal coliform concentrations were closely associated with the increased turbidity resulting from the storm flows. This association existed for all three types of turbidity plume movement--overflow, interflow, and underflow. As the turbidity plume moved down the reservoir, fecal coliform concentrations decreased due to die-off, settling, and dilution. With several assumptions, it is possible to use this information to assist in locating recreational sites in a reservoir or to anticipate possible body contact standard violations at existing recreation sites. WATER QUALITY PROJECTIONS: PREIMPOUNDMENT CASE STUDY,
Maryland Univ., College Park, Dept. of Civil Engineering.
R. H. McCuen, D. E. Cook, and R. L. Powell.
Water Resources Bulletin, Vol 16, No 1, p 79-85, February 1980. 9 Tab, 8 Ref.

Descriptors: *Water quality, *Reservoirs, *Model studies, *Maryland, Mathematical models, Data collections, Basic data collections, Surface waters, Runoff, Urban runoff, Precipitation(Atmospheric), Pollutants, Water temperature, Turbidity, Dissolved solids, Dissolved oxygen, Nutrients, Coliforms, Biochemical oxygen demand, Land use, Urbanization.

Recent regulations require impact statements for major water development projects, including reservoirs that will be used for water supply, recreation, and pollution control. A water quantity/quality model was developed and used for making water quality projections of a proposed reservoir in Montgomery County, Maryland. The study area was uncommon in that there was an extensive water quality data base. The results indicated that land use changes will have a significant effect on water quality and that the proposed reservoir will improve the quality of the surface waters downstream from the reservoir. A major effect of land use changes is the increase in the variability of water quality. (Sims-ISWS)

MODERN MARINE SEDIMENTS AS A NATURAL ANALOG TO THE CHEMICALLY STRESSED ENVIRONMENT OF A LANDFILL,
Geological Survey, Reston, VA. Water Resources Div.
M. J. Baedecker, and W. Back.
Journal of Hydrology, Vol 43, p 393-414, 1979. 9 Fig, 1 Tab, 48 Ref.

Descriptors: *Geochemistry, *Sediments, *Chemical reactions, *Environmental effects, *Landfills, Path of pollutants, Organic compounds, Fermentation, Oxidation-reduction potential, Gases, Leachate, Waste disposal, Isotope fractionation, Aquifers, Groundwater movement, Water quality, Delaware.

Chemical reactions that occur in landfills are analogous with those reactions that occur in marine sediments. Lateral zonation of C, N, S, O, H, Fe, and Mn species in landfills is similar to the vertical zonation of these species in marine sediments and results from the following reaction sequence: (1)

oxidation of C, N, S species in the presence of dissolved free oxygen to HC03(-), N03(-), and S04(=), (2) after consumption of molecular oxygen, then N03(=) is reduced and FE and Mn are solubilized, (3) S04(=) is reduced to sulfide, and (4) organic compounds become the source of oxygen, and CH4 and NH4 (+) are formed as fermentation products. In a landfill in Delaware the oxidation potential increases down-gradient and the redox zones in the reducing plume are characterized by: CH4(-), NH4(+), Fe(++), Mn(++), HC03(-), and N03(-). Lack of S04(=) at that landfill eliminates the sulfide zone. Although it has not been observed at landfills, mineral alteration should result in precipitation of pyrite and/or siderite downgradient. Controls on the pH of leachate are the relative rates of production of HC03(-), NH4(+), and CH4. Production of methane by fermentation of landfills results in carbon-13 isotope fractionation and the accumulation of isotopically heavy Sigma C02 (+10% to +18%)PDB. Isotope measurements may be useful to determine the extent of C02 reduction in landfills and extent of dilution downgradient. The boundaries of reaction zones in stressed aquifers are determined by head distribution and flow velocity. Thus, if the ground-water flow is rapid relative to reaction rates, redox zones will develop downgradient. Where ground-water flow velocities are low the zones will overlap to the extent that they may be indeterminate. (Kosco-USGS)

DIGITAL-TRANSPORT MODEL STUDY OF DIISOPROPYLMETHYLPHOSPHONATE (DIMP) GROUND-WATER CONTAMINATION AT THE ROCKY MOUNTAIN ARSENAL, COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
J. W. Warner.
Available from: OFSS, Box 25425, Fed Ctr, Denver CO 80225. Price codes: $5.50 in paper copy, $3.50 in microfiche. Geological Survey open-file report 79-676, August 1979. 39 p, 25 Fig, 6 Ref.

Descriptors: *Model studies, *Groundwater, *Water pollution, *Chemical wastes, *Path of pollutants, Waste disposal, Ponds, Groundwater movement, Groundwater barriers, Aquifer characteristics, Mathematical models, Evaluation, Colorado, *Rocky Mountain Arsenal(Colo), *Digital transport model, *Diisopropylmethylphosphonate.

Diisopropylmethylphosphonate (DIMP) is an organic compound produced as a by-product of the manufacture and detoxification of GB nerve gas. Ground-water contamination by DIMP from the disposal of wastes into unlined surface ponds at the Rocky Mountain Arsenal occurred from 1952 to 1956. A digital-transport model was used to determine the effects on ground-water movement and on DIMP concentrations in the ground water of a bentonite barrier in the aquifer near the northern boundary of the arsenal. The transport model is based on an iterative-alternating-direction-implicit mathematical solution of the ground-water-flow equation coupled with a method-of-characteristics solution of the solute-transport equation. The model assumes conservative (nonreactive) transient transport of DIMP and steady-state ground-water flow. In the model simulations, a bentonite barrier was assumed that was impermeable and penetrated the entire saturated thickness of the aquifer. Ground water intercepted by the barrier was assumed to be pumped by wells located south (upgradient) of the barrier, to be treated to remove DIMP, and to be recharged by pits or wells to the aquifer north (downgradient) of the barrier. The amount of DIMP transported across the northern boundary of the arsenal was substantially reduced by a ground-water-barrier system of this type. For a 1,500-foot-long bentonite barrier located along the northern boundary of the arsenal near D Street, about 50 percent of the DIMP that would otherwise cross the boundary would be intercepted by the barrier. This barrier configuration and location were proposed by the U.S. Army. Of the ground water with DIMP concentrations greater than 500 micrograms per liter, the safe DIMP-concentration level determined by the U.S. Army, about 72 percent would be intercepted by the barrier system. The amount of DIMP underflow intercepted may be increased to 65 percent by doubling the pumpage, or to 73 percent by doubling the length of the barrier. (Kosco-USGS)

A digital model calibrated to conditions in Cedar Creek was used to develop alternatives for future waste loadings that would be compatible with Indiana stream water-quality standards defined for two critical hydrologic conditions, summer and winter low flows. The model indicates that the dissolved-oxygen concentration of the Auburn wastewater effluent and nitrification are the most significant factors affecting the dissolved-oxygen concentration in Cedar Creek during summer low flows. The observed dissolved-oxygen concentration of the Auburn wastewater effluent was low and averaged 30 percent of saturation. Projected nitrogenous biochemical-oxygen demand loads, from the Indiana State Board of Health, for the Auburn and Waterloo wastewater-treatment facilities will result in violations of the current instream dissolved-oxygen standard (5 mg/l), even with an effluent dissolved-oxygen concentration of 80 percent saturation. Natural streamflow for Cedar Creek upstream from the confluence of Willow and Little Cedar Creeks is small compared with the waste discharge, so benefits of dilution for Waterloo and Auburn are minimal. The model also indicates that, during winter low flows, ammonia toxicity, rather than dissolved oxygen, is the limiting water-quality criterion in the reach of Cedar Creek downstream from the wastewater-treatment facility at Auburn and the confluence of Garrett ditch. Ammonia-nitrogen concentrations predicted for 1978 through 2000 downstream from the Waterloo wastewater-treatment facility do not exceed Indiana water-quality standards for streams. Calculations of the stream's assimilative capacity indicate that future waste discharge in the Cedar Creek basin will be limited to the reaches between the Auburn wastewater-treatment facility and County Road 68. (Kosco-USGS)

A ONE-DIMENSIONAL, STEADY-STATE, DISSOLVED-OXYGEN MODEL AND WASTE-LOAD ASSIMILATION STUDY FOR WILDCAT CREEK, HOWARD COUNTY, INDIANA,
Geological Survey, Indianapolis, IN. Water Resources Div.
C. G. Crawford, W. G. Wilber, and J. G. Peters.
Available from: OFSS, USGS Box 25425, Fed. Ctr. Denver, CO 80225. Paper copy $8.50, Microfiche $3.50. Geological Survey open-file report 79-1252, July 1979. 60 p, 19 Fig, 13 Tab, 53 Ref.

Descriptors: *Model studies, *Dissolved oxygen, *Waste assimilation capacity, *Water quality, *Indiana, Streams, Streamflow, Low flows, Reaeration, Effluents, Forecasting, Water quality standards, Water pollution, Waste water disposal, Mathematical models, Waste water treatment, Biochemical oxygen demand, Nitrification, Ammonia, Nitrates, Nutrients, *Howard County(Ind), *Wildcat Creek(Ind).

The Indiana State Board of Health is developing a water-quality management plan that includes establishing limits for wastewater effluents discharged into Indiana streams. A digital model calibrated to conditions in Wildcat Creek was used to predict alternatives for future waste loadings that would be compatible with Indiana stream water-quality standards defined for two critical hydrologic conditions, summer and winter low flows. The model indicates that benthic-oxygen demand is the most significant factor affecting the dissolved-oxygen concentrations in Wildcat Creek during summer low flows. The Indiana stream dissolved-oxygen standard should not be violated if the Kokomo wastewater-treatment facility meets its current National Pollution Discharge Elimination System permit restrictions (average monthly 5-day biochemical-oxygen demand of 5 milligrams per liter and maximum weekly 5-day biochemical-oxygen demand of 7.5 milligrams per liter) and benthic-oxygen demand becomes negligible. Ammonia-nitrogen toxicity may also be a water-quality limitation in Wildcat Creek. Ammonia-nitrogen waste loads for the Kokomo wastewater-treatment facility, projected by the Indiana State Board of Health, will result in stream ammonia-nitrogen concentrations that exceed the State standard (2.5 milligrams per liter during summer months and 4.0 milligrams per liter during winter months). Descriptors: *Sediment transport, *Erosion, *Sand waves, Hazards, Environmental effects, Oil pollution, Offshore platforms, Resources development, Alaska, Paths of pollutants, *Outer Continental Shelf, Cook Inlet, Petroleum development.

An intensive field investigation was carried out on near-bottom and bottom sediment movement within a small area of lower Cook Inlet that contains bedforms of multiple scales. This research effort focuses on the mechanisms which control the transport of sediments, the temporal variability of this transport and the contrasts in transport at trough and crest locations of the largest bed features. The major objective, to provide a spatial and temporal description of bottom sediment movement in this highly complex sand wave environment, was motivated by the need to assess the potential environmental hazards posed by excessive erosion and sand wave migration. High rates of sediment transport and erosion are potentially hazardous to sea floor installations. Additionally, waste materials introduced into the bottom environment by drilling operations and oil spilled during recovery accidents will be in part transported by the bottom currents. If oil-contaminated sediments are effectively transported large distances along the bottom, and resuspended well up into the overlying water column, the spatial extent of harmful effects from these pollutants could be considerably greater than otherwise anticipated. LIFE CYCLE, ECOLOGY, AND MANAGEMENT CONSIDERATIONS OF THE GREEN FILAMENTOUS ALGA, PITHOPHORA,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
C. A. Lembi, N. L. Pearlmutter, and D. F. Spencer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-185333, Price codes: A06 in paper copy, A01 in microfiche. Technical Report No 130, April 1980. 97 p, 46 Fig, 23 Tab, 87 Ref. OWRT B-081-IND(2).

Descriptors: *Pithophora, *Life cycles, *Aquatic algae, *Akinetes, Cladophora, Aquatic weed control, Copper sulphate, Ecology, Filamentous alga, Spores.

Pithophora, a green filamentous, spore-forming alga in the order Cladophorales, forms infestations of thick free-floating mats in small impoundments, shallow lakes, and coves and channels of larger lakes and reservoirs throughout the midwest and southeastern United States. The purpose of the research was to obtain data on the biology of Pithophora in order to establish a basis for management recommendations. The life cycle of Pithophora oedogonia consists of two stages: branching filamentous cells and akinetes. Both cell types are enclosed by a thick cell wall composed primarily of cellulose with additional amounts of sugars, amino sugars, and proteins, the latter being concentrated in the outer cell wall layer. Chiten comprises 6 percent of the cell wall by weight and is localized in the outer wall layers, cross wall disks and associated bands. Akinetes that form in the free floating mats in the fall reach their highest number in the winter, and germinate at 20C water temperature. Akinete formation is probably due to nitrogen depletion rather than cold temperature, are high in number in the hydrosoil and retain viability to depths of 10 cm. in the hydrosoil. Specific management techniques for control of Pithophora are being studied and will be reported in a subsequent publication. (Wiersma-Ind)

Descriptors: *Nitrogen, *Phosphorus, *Groundwater movement, *Nutrients, Urbanization, Test wells, Water levels, Water pollution, Waste water(Pollution), Aquatic plants, Water sampling, Bottom sediments, Eutrophication, Lake Mead.

The sources of nitrogen and phosphorus nutrient species, the chemical reactions occurring, and the parameters of nutrient uptake were studied for the Las Vegas Wash hydrologic system. Las Vegas

Wash, a natural drainage channel running from Las Vegas Valley to Lake Mead-Colorado River, has been the site of extensive urbanization in the past 20 years. The waste water increases associated with this development resulted in declining surface and groundwater quality and eutrophication of the Lake. Stricter effluent nutrient concentration standards were imposed and the effect of these standards is assessed. Water level measurements were taken in 14 wells in the area using a hand-held tape measure. Changes in water levels from the summer of 1975 to the summer of 1978 were determined. No area-wide improvement in shallow groundwater quality was found but several wells did indicate slow improvement. The wash was divided into two reaches to study flow budgeting. Results show that the inflow of groundwater above Pabco Road (Reach 1) is nearly zero while inflow below Pabco Road (Reach 2) is approximately 20 cfs. Salt input to Reach 1 has decreased while input to Reach 2 has remained constant. Also it appears that aquatic vegetation or bottom sediments in Reach 2 are accumulating P04(-3). Surface water quality has shown gradual improvement. (Seigler-IPA)

VERIFICATION OF A YORK RIVER ECOSYSTEM MODEL,
Virginia Inst. of Marine Science, Gloucester Point.
P. V. Hyer.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 246-252, 1978. 1 Fig, 2 Tab, 4 Ref.

Descriptors: *Estuaries, *Ecosystems, *Nutrients, *Model studies, Mathematical models, Biochemistry, Phytoplankton, Phosphorus, Nitrogen, Ammonia, Chlorophyll, Algae, Light, Photosynthesis, Water pollution, Water quality, Water pollution effects, Water pollution sources, *York River(VA).

The York River is a tidal estuary in a rural setting, where the chief occupations are farming, logging, and commercial fishing. Precipitation is lowest in September to January and highest in July and August, when thunderstorms abound. These storms, however, contribute relatively little runoff. The water temperature reaches 28C and sometimes 30C in late summer, but ice forms in about one winter out of every two. Summer is the critical time for water quality. The York is more than two miles wide in places, and its greatest depth approaches 30 meters. Therefore, a quasi three-dimensional model was decided on, with three lateral segments and two layers per reach. Observed chlorophyll concentrations ranged from 4-10 micrograms per liter, well below nuisance levels. It was found that arbitrarily doubling or tripling nutrient loadings input to the model could not trigger a bloom. Light was the most important factor controlling phytoplankton growth, followed by nitrogen availability. Oxygen levels were above five parts per million except in the deeper layer near the mouth, where a relatively stagnant region was created and oxygen concentration fell to about two parts per million. This natural phenomenon is not affected by point or nonpoint sources. (See also W80-05159) (Sims-ISWS)

SIMULATION OF ALGAL GROWTH IN THE CHOWAN RIVER,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
D. N. Contractor.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 253-264, 1978. 8 Fig, 7 Ref.

Descriptors: *Algae, *Rivers, *Virginia, *North Carolina, *Model studies, Mathematical models, Nitrogen, Nutrients, Ammonia, Oxygen, Biochemical oxygen demand, Chemical oxygen demand, Water quality, Water pollution, Water pollution effects, *Chowan River(VA, NC).

The Chowan River watershed lies in the southeastern part of Virginia. The Blackwater and Nottoway rivers form a confluence at the state line with North Carolina. The Meherrin River joins the Chowan River in a second confluence a few miles downstream of the first confluence. In the early 1970s, severe algal blooms occurred in the lower reaches of the Chowan River. A cooperative study of algal growth in the river was initiated in 1974. This paper presented some results of the mathematical model developed for the watershed above Holiday Island. (See also W80-05159) (Sims-ISWS)

THE STOCHASTIC VARIATION OF INSTREAM VALUES IN RIVERS,
Washington State Dept. of Ecology, Olympia.
R. T. Milhous, and K. D. Bovee.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 630-637, 1978. 3 Fig, 1 Tab, 2 Ref.

Descriptors: *Aquatic environment, *Mathematical models, *Habitat improvement, *Rivers, Stochastic processes, Fisheries, Water quality, Velocity, Analytical techniques, Water utilization, Statistical methods, Probability, Water temperature, Artificial substrates, Depth, Chinook salmon, Instream values.

An important part of the management of water resources is the allocation of water between out-of-stream uses and instream uses. In the context used, instream uses are all uses of water in the stream channel, except the production of hydroelectric power, with special attention given to the recreation and fisheries use of water instream. At this time very little work on instream flows has been done which describes the variation of the instream habitat over time; consequently, the information in this paper is incomplete and more in the nature of what could be done instead of what has been done. Ideas were presented as just that--ideas which can either be rejected in total, modified or expanded upon as an attempt is made to apply the concepts of stochastic process to instream flow-produced benefits. The use of statistics and stochastic approaches was in two areas: (1) the development of functional relationships between physical properties of streamflow and the biologic needs of a species of fish or a type of water-based recreation, and (2) the variation of the quality of the habitat over time. It was suggested that by combining a stochastic habitat model, as a driving variable for density dependence, with a population model, the observed variation in natural population of fish in a stream can be simulated. GROWTH AND PRIMARY PRODUCTIVITY OF MARINE MACROPHYTES EXPOSED TO DOMESTIC SEWAGE EFFLUENTS,
California Univ., Irvine. Dept. of Ecology and Evolutionary Biology.
A. C. Kindig, and M. M. Littler.
Marine Environmental Research, Vol 3, p 81-100, 1980. 7 Fig, 4 Tab, 26 Ref. OWRT A-054-CAL(11).

Descriptors: *Marine algae, *Growth rates, *Sewage effluents, Primary productivity, Domestic wastes, Primary treatment, Secondary treatment, Chlorination, Metabolism, Adaptation, Biomass, Photosynthesis, *Bossiella, *Lithothrix, *Corallina, *Amphiroa, *Acclimation.

This study provides the first response data for ten Southern California macrophytes exposed to untreated, primary, secondary and secondary chlorinated sewage effluent during long-term culture studies in the laboratory as well as short-term metabolic studies in the field and in the laboratory. Bossiella orbigniana, Lithothrix aspergillum and Corallina officinalis had relatively broad homeostatic capabilities and enhanced net production rates when exposed to primary treated sewage. In the long-term cultures, Amphiroa zonata, B. orbigniana and C. officinalis all demonstrated enhanced growth in the presence of primary sewage. Chlorination of effluent had only a short-term negative effect; i.e. species' responses to secondary and secondary chlorinated sewage were virtually identical beyond the second week in culture. Three populations of C. officinalis var. chilensis with differing pollution histories showed a tolerance to sewage corresponding to the extent of previous exposure, indicating that this species may be able to acclimate physiologically to sewage stress. The more sewage-tolerant macrophytes displayed lower photosynthetic quotient values during exposure to effluent than those possessing little tolerance to sewage. (Deal-ISWS)

THE FISH COMMUNITY OF LAKE SUPERIOR,
Ontario Ministry of Natural Resources, Maple. Fish and Wildlife Research Branch.
A. H. Lawrie.
Journal of Great Lakes Research, Vol 4, No 3-4, p 513-549, December 1978. 11 Fig, 18 Tab, 137 Ref, 1 Append.

Descriptors: *Lake Superior, *Fish, *Lake fisheries, *Surveys, Lakes, Fish populations, Lake Trout, Fish harvest, Salmon, Fish management, Lampreys, Fish establishment, Water pollution, Freshwater fish, Data collections, Lake Whitefish.

Lake trout, lake whitefish, and their relatives characterize the fish community of oligotrophic Lake Superior. That community has been substantially altered by the direct and indirect effects of man's activities, generally in the direction of reduced diversity and depletion of many fish stocks. Long-continued heavy fishing, predation by and competition from invading exotic species, and environmental degradation have all played a role as have efforts to rehabilitate the community by introducing hatchery-reared fish of desired species. Community responses to these influences have been complex, and although some are obvious and can be quantitatively modeled others reflect subtler, interactive responses to primary changes in abundance and size composition of various components of the community. Among the stresses whose roles remain to be clearly defined are the anthropogenic contaminants now known to occur, if only in small concentrations, in virtually all species. Although their impact on the welfare of individual fish stocks cannot be precisely defined at the moment, their presence at all is profoundly disturbing. (Humphreys-ISWS)

INVASION, POPULATION DYNAMICS AND ELEMENTAL ACCUMULATION OF CORBICULA FLUMINEA IN THE NEW RIVER AT GLEN LYN, VIRGINIA,
East Tennessee State Univ., Johnson City. Dept. of Environmental Health.
J. H. Rodgers, Jr., D. S. Cherry, K. L. Dickson, and J. Cairns, Jr.
In: Proceedings, First International Corbicula Symposium Texas Christian University, Fort Worth, October 13-15, 1977. p 99-110 (1977). 4 Fig, 2 Tab, 27 Ref. OWRT B-101-VA(2).

Descriptors: *Toxicity, Population dynamics, Bioassays, *Invasion, Mercury, Arsenic, Selenium, *Heated water, *Powerplants, Virginia, Invasion rate, Corbicula, *Asiatic Clam, Bioaccumulation, *New River(VA), *Glen Lyn(VA).

Corbicula fluminea has apparently successfully invaded the New River, and population densities of about 1,000 individuals per square meter have become established after three years. The influence of thermal effluent from a coal-fired power plant on population numbers was observed after an unusually cold winter had caused a severe decline in density in areas unaffected by heated water. Numbers remained essentially constant in the thermal effluent during the winter months. After the following spawning season, population densities outside of the thermal effluent recouped, although size classes were altered. Bioaccumulation of elements in soft body parts of Corbicula was generally intermediate in comparison to sediment and water. Of several potentially toxic elements, only selenium, mercury, and arsenic were found in soft body tissues in concentrations of less than 1 ppm. (Cherry-Virginia)

EXPERIMENTS IN RECYCLING SWINE MANURE IN FISHPONDS,
Illinois Natural History Survey Kinmundy.
D. H. Buck, R. J. Baur, and C. R. Rose.
Food and Agriculture Organization of the United Nations, Rome, Italy. Paper FIR: AQ/Conf/76/E 29, February 1976, 5 p. OWRT A-083-ILL(2).

Descriptors: *Swine manure, *Recycling, *Fish farming, *Fish, *Waste treatment, *Aguiculture, *Farm wastes, Waste management, *Buffalo fish, Chinese carps, Polyculture.

This is believed to have been the first attempt in North America to utilize certain Asian cultures and techniques in the solution of such problems as animal waste management, pollution control, and the production of protein. Two small Illinois ponds of similar size received nearly identical stockings of fish (three Chinese carps, common carp, largemouth bass, a hybrid buffalo fish and channel catfish), but differing amounts of swine manure. One pond (0.127 ha) received the total wastes from five growing pigs (about 39 pigs/ha of water area), the other pond (0.121 ha) received the wastes from eight pigs (66 pigs/ha). Two consecutive lots of pigs were fattened during the experiment. Water levels were lowered at mid-season to improve natural circulation, but conditions were otherwise static, with no artificial circulation or aeration. Over a fish-growing period of about 170 days (May to October 1975) the net increments in fish biomass were at the rates of 2971 kg/ha in the 0.127-ha pond, and 3834 kg/ha in the 0.121-ha pond. The high production of fish was attributed to: (1) the high quality of the swine rations; (2) an efficient density of stocking ratio of fish species; and (3) effective water level management. A beneficial influence by the fish population on water quality was indicated by continuously adequate levels of dissolved oxygen, and final BODs in the range of 8-12 mg/l.

OIL SPILL VULNERABILITY, COASTAL MORPHOLOGY, AND SEDIMENTATION OF KOTZEBUE SOUND,
South Carolina Univ., Columbia. Div. of Coastal Research.
M. O. Hayes, and C. Ruby.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VII, Transport, p 115-170, October 1979. 9 Fig, 5 Tab, 15 Ref, Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Oil spills, *Environmental effects, *Water pollution effects, *Baseline studies, Path of pollutants, Sedimentation, Exploration, Movement, Alaska, Resources development, *Outer Continental Shelf, Coastal morphology, Vulnerability index, Kotzebue Sound(AK).

The potential for oil spills in Alaskan waters is increasing as exploration and development continue to escalate. There is a complex interaction of marine processes during an oil spill which can make it extremely difficult to predict the track and dispersal pattern of an oil spill. However, numerous case studies permit the construction of an oil spill vulnerability scale which is based primarily on the longevity of spilled oil within each geomorphic environment, and the biologic sensitivity and natural cleaning ability of those environments. This scale is here modified for Kotzebue Sound. The scale has been devised on the basis of case studies and a careful study of the literature, and is based primarily on the longevity of oil in each subenvironment, which is generally a function of the intensity of the marine processes, sediment size and transport trends. The biologic sensitivity has also been utilized to modify the ratings of the various environments. Coastal environments are listed and discussed in order of increasing vulnerability of oil spills. METEOROLOGY OF THE ALASKAN ARCTIC COAST,
Washington Univ., Seattle. Polar Science Center.
T. L. Kozo, and R. A. Brown.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 1-45, October 1979. 28 Fig, 20 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-03-5-022-67.

Descriptors: *Meteorology, *Winds, *Baseline studies, *Ice, Water pollution effects, Environmental effects, Resources development, Alaska, Arctic, Path of pollutants, Coasts, *Outer Continental Shelf, Petroleum development.

Surface winds, temperature and atmospheric pressures along the Alaskan arctic coast were measured and analyzed to derive the wind field responsible for near shore (water depths to 20 m) surface water movement. Results of this study have shown that the surface wind field in spring and summer is strongly correlated at measuring stations separated by distances up to 100 km. This strong mesoscale correlation implies that a minimum of surface wind measurements points could provide a reasonable data set for coastal current trajectory studies. The effect of coastal winds on the summer nearshore circulation has relevance to transport of detritus, biota, spilled oil, and small ice floes. The sea breeze promotes barrier island lagoon flushing, and upwelling by maintaining persistent NE to E surface winds. Any attempt to predict current trajectories must include a prediction of the surface wind field. The summer main ice pack edge serves as a source for small ice floes which are driven into the nearshore region by surface wind and resultant currents. Uncovered sea bed pipelines in trenches running from the offshore islands to the coast will be susceptible to ice damage when floes move into shallow water with a northerly velocity component. Oil slicks that may result from such accidents will also be strongly influenced by the wind regime. (Sinha-OEIS)

CHARACTERIZATION OF THE NEARSHORE HYDRODYNAMICS OF AN ARCTIC BARRIER ISLAND-LAGOON SYSTEM,
Alaska Univ., Fairbanks. Geophysical Inst.
J. B. Matthews.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 57-97, October 1979. 19 Fig. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-03-5-022-56.

Descriptors: *Hydrodynamics, *Circulation, *Water quality, Barrier islands, Lagoons, Oil pollution, Water pollution effects, Environmental effects, Baseline studies, Resources development, Arctic, Alaska, Ecosystems, Lagoons, Marine environment, *Outer Continental Shelf, Petroleum development, Environmental impact.

This project provides sea level, temperature, salinity, current speed and direction data for stations within the proposed Beaufort Sea lease area. The lagoon waters are wind-driven in the open water season with currents in the same direction as the wind and with 3% the wind speed. Winds of 12 m/sec during a storm resulted in observed currents in Simpson Lagoon of 40 cm/sec. The sea level changes were about 1 m due to wind set-up whereas tidal ranged are from 10-20 cm. Barometric pressure does not have much influence on sea level during the open water season. Currents under ice were generally less than 10 cm/sec. The overall ecosystem processes study addresses only those processes which are anticipated to be impacted by activities related to petroleum development. Water quality and circulation, during both the open-water and ice-covered seasons, are a primary driving mechanism of the ecosystem. Water quality influences biological growth and migration routes for fish. Water circulation can carry pollutants and nutrients and is influenced by man-made changes to the environment, such as building of causeways, drilling pads and pipelines. One must know the existing water quality and circulation before oil development begins in order to assess probable impacts resulting from such activities. (Sinha-OEIS)

SOURCES, TRANSPORT PATHWAYS, DEPOSITIONAL SITES AND DYNAMICS OF SEDIMENTS IN THE LAGOON AND SHALLOW MARINE REGION, NORTHERN ARCTIC ALASKA,
Alaska Univ., Fairbanks. Inst. of Marine Science.
A. S. Naidu, and M. D. Sweeney.
In: Environmental Assessment of the Alaskan Continental Shelf. Annual Reports of Principal Investigators for year ending March 1979. Vol VIII, Transport, p 98-181, October 1979. 6 Fig, 17 Tab, 36 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado. NOAA-03-5-022-56.

Descriptors: *Sediment transport, *Heavy metals, Oil spills, *Ecosystems, Baseline studies, *Sedimentation, Resources development, Water pollution effects, Environmental effects, Arctic, Alaska, Lagoons, Marine environment, *Outer Continental Shelf, Beaufort Sea, Petroleum development.

The major objectives of this program are to understand the dynamics of sedimentation, to characterize benthic substrate habitats, and to elucidate the sources and depositional sites of terrigenous particles in the lagoon and adjacent shelf area of north arctic Alaska. Additional goals include completion of collection of baselines of a suite of heavy metals relative to sediments of the Beaufort Sea, understanding of the geochemical partitioning of the heavy metals in various sediment phases, and estimation of the rate of sedimentation. Compilation of all available data on textural attributes of surficial sediments of the Beaufort Sea has been completed. Maps generated to display regional variations in the gross lithology and the various statistical grain size parameters will be useful to biologists interested in characterizing the benthic habitats of the Beaufort Sea, as well as to geologists who are concerned with elucidation of Holocene depositional history of the Beaufort Sea. The baseline data on heavy metals in sediments should help in detection of any large scale perturbations in environments that might result from discharge of chemical pollutants into the nearshore areas. The baseline lithology maps should serve a useful purpose in detecting any changes in sediment budgets (and by implication benthic habitats) resulting from petroleum-related activities such as dredging, causeway construction and possible gravel/sand exploitation. (Sinha-OEIS)

5D. Waste Treatment Processes

EVALUATION OF MEMBRANE PROCESSES AND THEIR ROLE IN WASTEWATER RECLAMATION,
Orange County Water District, Fountain Valley, CA.
D. G. Argo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-185754, Price codes: A12 in paper copy, A01 in microfiche. Final Report prepared for the Office of Water Research and Technology, November 1979. 234 p. OWRT C-80159-R (No 8520)(1).

Descriptors: *Advanced wastewater treatment, *Water reuse, *Facilities, Water reclamation, Trace organics, Reverse osmosis, Demineralization, Biological treatment, Orange County Water District(California), Costs, Facilities, Design.

Water Factory 21 (WF-21) in Orange County, California, is a 15 mgd advanced wastewater treatment (AWT) plant designed to reclaim biologically treated municipal wastewater for injection into a seawater barrier system. Processes included are lime treatment, air stripping, filtration, activated carbon adsorption, reverse osmosis (RO), and chlorination. The effectiveness of each process is presented, with emphasis on demineralization, ozone and biologically activated carbon, and ultrafiltration. The data show that the combination of processes used at WF-21 is capable of producing a very high quality water. All contaminants were reduced below national interim primary drinking water regulation maximum contaminant levels at least 98% of the time. Over 100 trace organic substances were found in the influent to WF-21, and of these about 30 were regularly monitored. The two processes found most effective in removal of specific organics were air stripping and activated carbon adsorption. Overall removals generally exceeded 90%. Viruses were routinely found in WF-21 influent. On two occasions viruses were detected in the activated carbon effluent during upflow operation of the columns. Following modifications, no viruses have ever been found in the effluent from the activated carbon columns or that from the RO system. AWT cost at WF-21 is $665/mil gal and the additional cost of RO demineralization is $621/mil gal. These figures include all operation and maintenance costs as well as amortization of capital.
W80-05105

VIRUS REMOVAL BY ADVANCED WASTEWATER TREATMENT.
Orange County Water District, Fountain Valley, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-188386, Price codes: A09 in paper copy, A01 in microfiche. Final Report, Prepared for the Office of Water Research and Technology, October 1979. 139 p, 36 Fig, 60 Tab, 45 Ref, 5 Append. OWRT C-80159-R (No 8520)(2), 14-34-0001-8520.

Descriptors: *Viruses, *Waste water treatment, *Chlorination, *Reverse osmosis, Lime, Aluminum, California, Activated carbon, Water purification, Assay, Analytical techniques, Sewage effluents, Diseases, Public health, Orange County Water District(Cal).

An enteric virus monitoring program was performed during 1975-1979 at Water Factory 21 in the Orange County Water District in California to develop sensitive quantitative determination methods for enteric viruses, to monitor the plant's chlorinated effluent for enteric viruses, and to evaluate the effectiveness of the plant's individual unit processes. Water Factory 21 represents the state-of-the-art technology in water reclamation and incorporates a 5 mgd reverse osmosis plant. Eleven experiments were performed to develop an optimized methodology for concentrating enteric viruses from plant effluents. An adsorption procedure was selected that involves adjusting the sample to a pH of 3.5 and adding Al(III). The Filterite filter, found to be the best of four studied adsorbents, was used in calibration tests at the various sites to determine the volume that could be processes by the adsorbent. The liquid culture assay system using cytopathic effects with Buffalo Green monkey kidney cells and human carcinoma cells was found to recover the largest number of isolates. Assays were performed on 207 samples from various treatment processes. Lime treatment was found to have a 98 to 99.9% removal capability. No positive samples were found in the reverse osmosis influent or effluent or in the granular activated carbon unit. Of 122 chlorinated effluent samples assayed, 2 were positive and both were associated with atypical operating conditions. (Seigler-IPA)

WASTEWATER TREATMENT IN COLD REGIONS BY OVERLAND FLOW,
Cold Regions Research and Engineering Lab., Hanover, NH.
C. J. Martel, T. F. Jenkins, and A. J. Palazzo.
CRREL Report 80-7, February 1980. 18 p, 6 Fig, 10 Tab, 16 Ref.

Descriptors: *Cold regions, *Overland flow, *Waste water treatment, Sewage treatment, Biochemical oxygen demand, Seasonal, Winter, Forages, New Hampshire, Subsurface runoff, Water pollution, Snowmelt, Nitrogen, Water storage.

Three types of water, primary effluent, secondary effluent, and tapwater, were applied to separate sections of a pilot-scale overland flow site in Hanover, New Hampshire, to evaluate the performance of overland flow waste water treatment in cold regions. The study area has a mean annual temperature of 7C and the temperature falls below 0C approximately 160 days/year. The test site was 30.5 m long, 8.8 m wide, with a 5% slope. Primary and secondary waste water were obtained from pilot plant units and tapwater was supplied by the Hanover water supply system. Applications were made daily at 0.25 cm/hr for an average weekly application rate of 5 cm/week. Measurements were taken for one year of surface runoff, subsurface flows, precipitation, evaporation, percolation, soil temperature, and meteorological parameters. Results show that overland flow is a successful treatment method for primary and secondary effluent during all seasons of the year except winter. Runoff from the primary section exceeded the 30-mg/liter BOD standard for 82 days during winter, however, runoff from the secondary section did meet standards for the same period. The tapwater section, used as a control, showed no pollutants. Nitrate was the most difficult form of nitrogen to remove while ammonia was the easiest. Excellent forage yield was observed for both of the waste water sections and winter applications caused only minor injury. Storage prediction times from the EPA-1 computer program appear to be adequate. (Seigler-IPA)

ULTRAFILTRATION TREATMENT OF POULTRY PROCESSING WASTEWATER AND RECOVERY OF A NUTRITIONAL BY-PRODUCT,
North Carolina State Univ. at Raleigh. Dept. of Poultry Science.
J. C. H. Shih, and M. B. Kozink.
Poultry Science, Vol 59, No 2, p 247-252, Feb 1980. 4 Fig, 3 Tab, 12 Ref. OWRT A-100-NC(2), 14-34-0001-8035.

Descriptors: *Poultry processing, Water reuse, By-product recovery, Membrane flux, *Waste water treatment, *Industrial wastes, Wastewater reuse, Membrane ultrafilter, Poultry industry.

A lab-scale membrane ultrafilter was constructed with one pair of tubular membranes, a circulation pump, and a storage tank. It was devised to treat the poultry processing wastewater in the laboratory and, simultaneously, to recover a by-product which was found to have nutritional value for its protein and fat contents. The wastewater collected from the poultry processing plant was circulating at 2.8 kg/cm2 (40 psi) and 57 liter/min (15 gal/min) around the membrane to perform an average membrane flux of 407 liter/day/m2 (10 gal/day/ft2). The original wastewater and the resulted permeate and concentrate were analyzed for chemical oxygen demand (COD), total solids (TS), nitrogen, fat and protein. The permeate, which contained only 240 mg/liter TS and 131 mg/liter COD, was believed to be safe for direct discharge or potential reuse. The by-product, which was generated from the drying of the concentrate, contained 30 to 35% of true protein and 24 to 45% of fat. The chemical score based on amino acid analysis was comparable to that of soybean protein. The results indicated that this new method may have great potential for application to the treatment of poultry processing wastewater. The by-product with its nutritional value could make it possible to generate an economic return for the processing industry to reclaim the operating cost and, perhaps, a part of the facility investment. PHOSPHORUS CONTROL STRATEGIES AT MUNICIPAL WASTEWATER TREATMENT PLANTS IN THE U.S. GREAT LAKES BASIN,
Great Lakes Basin Commission, Ann Arbor, MI.
T. J. Monteith, R. A. Sullivan, and W. C. Sonzogni.
Great Lakes Environmental Planning Study, Contribution No 14, February 1980. 38 p, 12 Tab, 24 Ref.

Descriptors: *Phosphorus, *Sewage treatment, *Great Lakes, *Phosphorus removal, Detergent control, Great Lakes Environmental Planning Study, State phosphorus control programs, Point source inputs, Phosphorus loads, Municipal discharges.

Discharges from municipal wastewater treatment plants are the major source of total phosphorus (P) entering the Great Lakes. This report documents the current status of municipal P control programs in the Great Lakes basin. Thus, state policy on reducing P from municipal wastewater treatment plants within the Great Lakes basin and the present rate of compliance with this policy was examined. Information on the current technologies in use for controlling P at municipal wastewater treatment plants was also compiled. Finally, reductions in municipal P loads to surface water are presented. Each of the eight Great Lakes states has established P effluent limitations for sewage treatment plants. All plants discharging to Great Lakes surface waters, with a design flow of 1 million gallons per day (mgd) or greater, must limit the total P concentration in their effluent to 1 milligram per liter (mg/l). Most of the plants in the U.S. basin with P removal utilize a chemical precipitation process. Some use land application and others use tertiary advanced treatment processes, such as chemical treatment followed by special filtration. Five of the Great Lakes states currently limit P content to 0.5% by weight in home laundry detergents. Limiting P in these detergents is designed to reduce the amount of P entering municipal plants and reduce P discharges from combined sewer overflows.

5E. Ultimate Disposal Of Wastes

LIMESTONE LINER FOR LANDFILL LEACHATES CONTAINING BERYLLIUM, CADMIUM, IRON, NICKEL, AND ZINC,
Arizona Univ., Tucson. Dept. of Soils, Water, and Engineering.
J. Artiola, and W. H. Fuller.
Soil Science, Vol 129, No 3, p 167-179, March 1980. 6 Fig, 5 Tab, 33 Ref.

Descriptors: *Landfills, *Linings, *Limestones, *Leachate, *Heavy metals, Beryllium, Cadmium, Iron, Nickel, Zinc, Soil chemistry, Movement, Ion transport, Laboratory tests, Soils, Solid wastes,

Waste disposal, Adsorption, Ion exchange, Flue gas scrubbing.

The influence of crushed agricultural limestone, placed in a layer over six soils, on the rate of migration of beryllium, cadmium, iron, nickel, and zinc contained in municipal, solid-waste, landfill leachate, was evaluated. The limestone was highly effective in slowing the rate of migration of beryllium, cadmium, nickel, and zinc in all six soils, which represent five major soil orders of the United States. Not only breakthrough (C/C sub 0 = 0.5) but also final breakthrough (C/C sub 0 = 1) values were significantly delayed (twofold to threefold) over soil alone. The limestone effect was considerably more than additive, i.e., several times more than the sum of soil alone plus limestone alone. The limestone effects were not the same for the individual metals. Attenuation effects were greatest for beryllium and least for cadmium. The migration rate of iron, indigenous to the landfill leachate, also was favorably slowed by the limestone barrier layered over the soils. (Visocky-ISWS)

HAWAIIAN WASTE INJECTION PRACTICES AND PROBLEMS,
Hawaii Univ., Honolulu. Water Resources Research Center.
S. Petty, and F. L. Peterson.
Technical Report No 123, January 1979. 104 p, 3 Tab, 4 Fig.

Descriptors: *Waste disposal wells, *Injection wells, *Sewage effluents, Clogging, Suspended solids, Microorganisms, Hawaii, Construction, Evaluation, *Ghyben-Herzberg lens, Rehabilitation, Oahu, Maui, Kauai.

In recent years in Hawaii numerous shallow waste injection wells, constructed for the disposal of domestic sewage effluent, have failed to operate as designed. A field reconnaissance of all the known waste injection wells on Oahu and Kauai, and approximately half of those on Maui, was made and their methods of operation and injection problems evaluated. The results of this study indicate that injection well problems are primarily due to physical and biological, and probably to a much lesser extent, chemical clogging phenomena at the well face. The clogging in a large part results from improper treatment plant operation, improper injection well operation and maintenance, and poor well site selection. Improper well construction practices also contribute to a much lesser degree. Furthermore, the results of this study indicate that inadequate data collection, both prior to and after injection has begun, makes early detection and solution of the injection problems more difficult. Recommendations for more adequate data collection and treatment plant and injection well operation and maintenance are made which hopefully will avoid or at least alleviate many of the injection well problems encountered in this study.

THE SILURIAN SALT DEPOSITS IN EASTERN LAKE, NORTHWESTERN ASHTABULA, AND NORTHEASTERN GEAUGA COUNTIES, OHIO,
Geological Survey, Columbus, OH. Water Resources Div.
S. E. Norris.
Geological Survey open-file report 79-269, December 1978. 15 p, 8 Fig, 2 Tab, 2 Ref.

Descriptors: *Salts, *Ohio, *Aggregates, *Sedimentary rocks, *Carbonate rocks, Inorganic compounds, Sites, Drilling, Test wells, Subsurface investigations, *Radioactive waste disposal, *Silurian salt deposits, *Northeast Ohio.

Five salt zones, comprising single or multiple salt beds interbedded with dolomite, dolomitic shale and anhydrite, occur in a 250-square-mile area in eastern Lake, northwestern Ashtabula, and northeastern Geauga Counties, Ohio. The aggregate thickness of salt-bearing rocks, from the base of the lowest salt to the top of the highest salt, ranges from about 300 feet in the northern part of the area to more than 450 feet in the southern part. The aggregate thickness of salt, exclusive of the intervening rocks, also increases southward, from about 100 feet to more than 200 feet. The thickest salt bed, the F1A salt, is 35 to 38 feet thick in northeastern Geauga and southeastern Lake Counties. (Kosco-USGS)

5G. Water Quality Control

WATER QUALITY TRAP EFFICIENCY OF STORM WATER MANAGEMENT BASINS,
Maryland Univ., College Park. Dept. of Civil Engineering.
R. H. McCuen.
Water Resources Bulletin, Vol 16, No 1, p 15-21, February 1980. 4 Fig, 7 Tab, 11 Ref.

Descriptors: *Detention reservoirs, *Water quality, *Urban runoff, *Water quality control, Water pollution, Water pollution sources, Water pollution control, Sediments, Chemicals, Pollutants, Urban hydrology, Storm runoff, Storage, Water management(Applied), On-Site investigations, Data collections, Biochemical oxygen demand, Chemical oxygen demand, Metals, Nutrients.

While the quality of rivers has received much attention, the degradation of small streams in upland areas of watersheds has only recently been recognized as a major problem. A major cause of the problem is increases in nonpoint source pollution that accompany urban expansion. A case study was used to examine the potential for storm water detention as a means of controlling water quality in streams of small watersheds. The storm water management basin, which is frequently used to control increases in discharge rates, can also be used to reduce the level of pollutants in inflow to receiving streams. Data collected on a 148-acre site in Maryland showed that a detention basin can trap as much as 98% of the pollutant in the inflow. For the 11 water quality parameters, most showed reductions of at least 60%, depending on storm characteristics. (Sims-ISWS)

ON THE SCALING OF LABORATORY OXYGENATION STUDIES,
Karlsruhe Univ. (Germany, F.R.). Inst. fuer Wasserbau III.
M. Markofsky.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 801-810, 1978. 7 Fig, 7 Ref.

Descriptors: *Model studies, *Oxygenation, *Water quality control, *Reaeration, Hydraulic models, Dissolved oxygen, Reviews, Laboratory tests, Weirs, Data collections, Diffusion, Methodology, Open channel flow, Bubble curtains, Diffusers.

Literature and laboratory studies on artificial aeration were undertaken. The work was divided into three phases: (1) A literature study of weir aeration: This was undertaken because the large amount of laboratory and field data available in the literature enables, through dimensional analysis, a detailed investigation of model-prototype behavior to be made. (2) Experimental studies of diffused air aeration in flowing water using two-dimensional bubble curtains: In these studies systematic variations were made of the primary variables affecting aeration efficiency per unit depth, i.e., air flow rate per unit width, ambient water velocity, and type of diffuser. The laboratory results were compared with published laboratory and field data. (3) Experimental studies of diffused air aeration in stagnant water-model family: In three different diameter pipes in which water depths of up to 2.1 m could be obtained, the effect of model dimensions on aeration efficiency using single port diffusers was investigated. In these experiments the air flow rate, water depth, pipe diameter, and air port diameter were systematically varied. The ability to scale from smaller to larger pipe diameters was investigated thus yielding insight into model-prototype behavior. A nomogram was presented for the prediction of oxygen transfer as a function of the weir nappe Froude and Reynold's numbers. (See also W80-05159) (Humphreys-ISWS)

IRRIGATOR INVOLVEMENT IN THE IMPLEMENTATION OF AGRICULTURAL NONPOINT SOURCE POLLUTION CONTROL PROGRAMS,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
R. G. Evans, W. R. Walker, and G. V. Skogerboe.
Water Resources Bulletin, Vol 16, No 1, p 133-136, February 1980. 1 Fig, 1 Tab, 8 Ref. EPA R-804672.

Descriptors: *Irrigation, *Water pollution control, *On-site investigations, *Colorado, Salinity, Salts, Water pollution, Water pollution sources, Pollutants, Farm management, Irrigation practices, Water management(Applied), Water users, Agriculture, Nonpoint water pollution sources.

Recently, Congress designated irrigated agriculture under the 'nonpoint source' category covered by Section 208 of P.L. 92-500 and involves the use of 'best management practices.' Generally, the most appropriate solutions for pollution abatement from irrigated agriculture involve the delivery and use of water rather than the treatment of irrigation return flows: (1) Technological alternatives should be utilized that are sensitive to local conditions and acceptable to the farmers. (2) Informational and educational programs to assist farm operators individually and collectively must be instituted prior to the start of the project; imaginatively conceived, and continuously modified and upgraded if motivation for change is to be encouraged. (3) Technical assistance personnel should be given short courses in skills needed for working effectively with irrigators. (4) Communication techniques used for working with farmers as individuals and groups should be designed into the implementation program and evaluated. (5) Credibility and trustworthiness of federal and state agencies in the eyes of the irrigators provide the important final ingredient in effectively implementing change and reducing nonpoint source pollution from irrigated agriculture. (Sims-ISWS)

EPA SETS RULES ON HAZARDOUS WASTES,
R. J. Smith.
Science, Vol. 207, No. 4436, p 1188, March 14, 1980.

Descriptors: *Waste disposal, *Regulations, *Hazardous wastes, Waste treatment, Water pollution treatment, Waste storage, Costs, Repairing, Environmental Protection Agency.

The EPA has published final rules requiring that generators, transporters, and disposers of hazardous wastes maintain records detailing exactly where the wastes are going. The cost of the resul-

tant paperwork is expected to be between $16 and $24 million annually. The EPA will also designate specific hazardous wastes and establish waste treatment, storage and disposal standards. The total cost of implementing these regulations has been estimated at about $1 billion annually. The cost of repairing damage done by improper disposal is estimated at 444 billion. Neither the states nor the federal government can afford the repair cost and numerous owners of substandard waste sites have threatened to walk away from their properly if the new regulations cost too much. The EPA is proposing a cleanup 'super-fund' which will draw its revenues from an annual contribution of 4700 million from the chemical industry. The fund will be used to clean up waste sites where a responsible party cannot be determined. (Purdin-NWWA)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

APPLICATIONS AND EVALUATION OF DECISION ANALYSIS IN WATER RESOURCES PLANNING,
Decision Science Consortium, Inc., Falls Church, VA.
D. A. Seaver, R. V. Brown, V. N. Campbell, J. W. Ulvila, and J. O. Chinnis, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-185481, Price codes: A04 in paper copy, A01 in microfiche. Technical Report 79-2, Prepared for Office of Water Research and Technology, December 1979. 67 p, 35 Ref, Append. OWRT C-80054-P (No 8406)(1).

Descriptors: *Planning, *Decision making, *Decision analysis, Cost-benefit analysis, Water supply development, Evaluation, Water resources development, Computer models.

Decision analysis is a systematic way of structuring the considerations that enter into a planning or decision making problem. It facilitates the planning or decision making process primarily by enabling attention to be directed selectively at different components in a complex problem, and by properly integrating the various components. As such, decision analysis may offer a comprehensive, consistent framework for water resources planning that fills some existing methodological and practical gaps in current planning approaches. The work reported here was undertaken to explore the applicability of decision analysis to water resources planning. Our approach was to use decision analysis in two ongoing problems, working closely with the responsible planning authorities in each case. These applications, and an evaluation of the usefulness of decision analysis, are reported here. We also have provided some additional description of the general techniques and uses of decision analysis that potentially may be particularly appropriate for water resources planning. Our work indicates that decision analysis generally is seen as appropriate and useful by planners, and does offer some technical improvements for planning. However, many organizational and institutional constraints must be overcome to expand the actual use of decision analysis. Some suggestions are made as to how institutional acceptance may be gained.

PROGRAMMABLE HAND CALCULATOR PROGRAMS FOR PUMPING AND INJECTION WELLS: II--CONSTANT PUMPING (INJECTION) RATE, SINGLE FULLY PENETRATING WELL, SEMICONFINED AQUIFER,
Missouri Univ. Rolla. Dept. of Geological Engineering.
D. L. Warner, and M. G. Yow.
Ground Water, Vol 18, No 2, p 126-133, March-April 1980. 3 Tab, 7 Ref, 2 Append. EPA R805039-01-1.

Descriptors: *Wells, *Pumping, *Injection wells, *Model studies, Mathematical models, Computer programs, Water wells, Oil wells, Aquifers, Pressure, Drawdown, Groundwater, Hydrology, Semiconfined aquifers, Hand calculator programs.

In a previous article, programmable calculator programs were given for the calculation of head or pressure changes resulting from the pumping of wells completely penetrating a fully confined aquifer. Aquifers are often only semiconfined. That is, they are confined by aquitards or leaky confining beds. Such aquifers are frequently referred to as leaky aquifers. In this article, programs were documented for the calculation of head or pressure change resulting from pumping from or injection into a semiconfined aquifer. The programs were for the Texas Instruments TI 59 card programmable calculator, and were given in water well and practical oilfield units. Listings of the programs were contained in the appendices. MODELS AND METHODOLOGIES IN MULTIOBJECTIVE WATER RESOURCES PLANNING,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
D. M. Mades, and G. Tauxe.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-185952, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Center, University of Illinois Research Report No 150, February 1980. 98 p. OWRT B-105-ILL(4), 14-34-0001-7154.

Descriptors: *Multiple objectives, *Planning, *Water resources, Optimization, River basins, Water quality, Reservoirs, Models, *Systems analysis, Linear programming, Dynamic programming, Non-linear programming, *Model studies, Evaluation, *Mathematical models.

The number of mathematical models used to represent complex water resource systems has grown with the advent of high-speed computers and the validation of empirical hydrologic and hydraulic relations. At the same time, algorithms for solving mathematical decision-making models have also experienced rapid growth and development in the field of operations research. More recently, the planner has been forced to consider multiple objectives, which often conflict, in designing water resource systems. This report discusses the application of multiple objective optimization algorithms to water resources related problems. A very intensive survey of previous research in this area is summarized under the areas of river basin planning, water-quality management and reservoir management. Multi-objective or vector-valued optimization algorithms are reviewed as an extension of the earlier single objective optimization algorithms. An extension of classical dynamic programming was formulated during this study. Multiobjective dynamic programming was applied to several planning problems to illustrate its useful potential. The algorithm was used to generate trade-off functions for hypothetical and case reservoir studies and a stream water quality problem. This report represents a general overview of existing multi-objective water resources planning models. The general strengths and weaknesses of the various multi-objective optimization algorithms are briefly discussed. This report is intended to illustrate the usefulness of mathematical modelling in water resources planning.

A PLAN TO STUDY THE AQUIFER SYSTEM OF THE CENTRAL VALLEY OF CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
G. L. Bertoldi.
Available from: OFSS, Box 25425, Fed Ctr, Denver CO 80225. Price codes: $6.50 in paper copy, $3.50 in microfiche. Geological Survey open-file report 79-1480, October 1979. 48 p, 3 Fig.

Descriptors: *Model studies, *Aquifer systems, *California, *Groundwater, *Water levels, Alluvial aquifers, Pumping, Drawdown, Agriculture, Irrigation, Computer models, Projections, Water utilization, Water quality, Energy, Groundwater management, Water management(Applied), Evaluation, Central Valley(Calif).

Unconsolidated Quaternary alluvial deposits comprise a large complex aquifer system in the Central Valley of California. Millions of acre-feet of water is pumped from the system annually to support a large and expanding agribusiness industry. Since the 1950's, water levels have been steadily declining in many areas of the valley and concern has been expressed about the ability of the entire ground-water system to support agribusiness at current levels, not to mention its ability to function at projected expansion levels. At current levels of ground-water use, an estimated 1.5 to 2 million acre-feet is withdrawn from storage each year; that is, 1.5 to 2 million acre-feet of water is pumped annually in excess of annual replenishment. The U.S. Geological Survey has initiated a 4-year study to develop geologic, hydrologic, and hydraulic information and to establish a valleywide groundwater data base that will be used to build computer models of the ground-water flow system. Subsequently, these models may be used to evaluate the system response to various ground-water management alternatives. This report describes current problems, objectives of the study, and outlines the general work to be accomplished in the study area. A bibliography of about 600 references is included. (Kosco-USGS)

A ONE-DIMENSIONAL, STEADY-STATE, DISSOLVED-OXYGEN MODEL AND WASTE-LOAD ASSIMILATION STUDY FOR SOUTH FORK WILDCAT CREEK, CLINTON COUNTY, INDIANA,
Geological Survey, Indianapolis, IN. Water Resources Div.
C. G. Crawford, W. G. Wilber, and J. G. Peters.
Available from: OFSS, USGS, Box 25425, Fed Ctr, Denver CO 80225. Price codes: $9.25 in paper copy, $3.50 in microfiche. Geological Survey open-file report 79-1074, July 1979. 66 p, 23 Fig, 11 Tab, 59 Ref.

Descriptors: *Model studies, *Dissolved oxygen, *Waste assimilation capacity, *Water quality, *Indiana, Streams, Forecasting, Streamflow, Low flows, Effluents, Water pollution, Water quality standards, Waste water disposal, Waste water treatment, Reaeration, Mathematical models, Biochemical oxygen demand, Nitrification, Ammonia, Nitrates, Nutrients, *Clinton County(Ind), *South Fork Wildcat Creek(Ind).

The Indiana State Board of Health is developing a State water-quality management plan that includes

establishing limits for wastewater effluents discharged into Indiana streams. A digital model calibrated to conditions in South Fork Wildcat Creek was used to predict alternatives for future waste loadings that would be compatible with Indiana stream water-quality standards defined for two critical hydrologic conditions, summer and winter low flows. Natural streamflow during the 7-day, 10-year low flow is zero, so no benefit from dilution is provided. The Indiana State Board of Health's projected ammonia-nitrogen concentration for the Frankfort wastewater-treatment facility will violate the instream total ammonia-nitrogen standard of 2.5 mg/l and 4.0 mg/l during summer and winter low flows, respectively. The model indicates that nitrification and algal respiration were significant factors affecting the dissolved-oxygen dynamics of South Fork Wildcat Creek during two water-quality surveys. Stream water quality during the two water-quality surveys was degraded by the discharge of wastewater receiving only primary treatment. Benthic deposits resulting from this wastewater discharge seem to exert a considerable oxygen demand. The discharge of partially treated wastewater should be eliminated when a new wastewater-treatment facility becomes operational in mid-1979. Therefore, benthic-oxygen demand due to benthic deposits should become negligible at that time. (Kosco-USGS)
W80-05299

CONTRIBUTION OF GROUNDWATER MODELING TO PLANNING,
Geological Survey, Reston, VA. Water Resources Div.
J. E. Moore.
Journal of Hydrology, Vol 43, p 121-128, 1979. 1 Tab, 15 Ref.

Descriptors: *Groundwater, *Computer models, *Analog models, *Planning, Digital computers, Groundwater availability, Forecasting, Water quality, Water supply, *Water resources development, Conjunctive use, Surface-groundwater relationships.

The consideration of ground water in water-resource planning frequently has been neglected because many planners believed that ground water could not be adequately evaluated in terms of availability, quality, cost of development, or effect of development on the surface-water supply. The development of predictive ground-water models now provides the water planner with tools to evaluate these problems. Highly sophisticated digital models can be used in planning the development of ground water and the conjunctive use of ground and surface water. The models are powerful tools for predicting the response of groundwater systems to stresses. They can also clarify the cause and progress of past stress. With this development it is now possible to integrate the utilization of ground water into water-resource planning with a high degree of confidence. (Kosco-USGS)

U.S. HEAVY METAL LOADINGS TO THE GREAT LAKES: ESTIMATES OF POINT AND NONPOINT CONTRIBUTIONS,
Great Lakes Basin Commission, Ann Arbor, MI
T. M. Heidtke, D. J. Scheflow, and W. C. Sonzogni.
Great Lakes Environmental Planning Study, Contribution No 12, January 1980. 35 p, 18 Tab, 19 Ref.

Descriptors: *Trace elements, *Sewage treatment, *Overland flow, *Great Lakes. Path of pollutants, *Heavy metals, *Municipal wastes, Copper, Zinc, Lead, Cadmium, Forecasting, Great Lakes Environmental Planning Study, Projected trace metal loadings, Municipal discharges, Point and nonpoint source inputs.

Estimates of current and future loadings of copper, zinc, lead and cadmium to the Great Lakes from municipal wastewater effluents and land drainage in the U.S. were generated using information provided by individual water quality management (208) plans, as well as other recent studies of point and nonpoint source pollution within the basin Projections indicate that by the year 1990 the U.S. municipal point source contribution will likely decrease by 20-30% from mid-1970 levels as a result of phosphorus control measures. In the absence of additional programs to control land drainage in the U.S., the annual lake input of these metals from rural runoff should exhibit a slight decrease (less than 5%) over the next 20 years, whereas loadings attributable to urban runoff should increase up to 20% over the same period. Land drainage in the U.S. portion of the Great Lakes basin appears to contribute a much higher input of metals than do municipal wastewater treatment plants. Hypothetical programs to control nonpoint source phosphorus loads within the basin were compared on the basis of their ability to reduce metals loads. Results indicate that low cost, voluntary measures to control rural runoff are not likely to significantly reduce metals loadings to the lakes, while remedial measures to control urban runoff, although costly, offer the potential for significant reductions in annual inputs of lead, zinc, copper and cadmium.

6B. Evaluation Process

THE ECONOMIC CONSEQUENCES OF IRRIGATING CORN ON FINE TEXTURED SOILS IN THE HUMID MIDWEST,
Purdue Univ., Lafayette, IN. Dept. of Agricultural Economics.
R. L. Clouser, and W. L. Miller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-185341, Price codes: A03 in paper copy, A01 in microfiche
Purdue University Water Resources Research Center Technical Report No 96, April 1980. 47 p, 15 Tab, 19 Ref, 1 Append. OWRT B-120-ILL(1).

Descriptors: *Irrigation, *Corn, *Economic feasibility, *Soil texture, Central United States, Irrigation practices, Supplemental irrigation, Farm ponds, Reservoirs, Wells, Humid areas, Irrigation systems, Soybeans, Farm management, Indiana, Illinois, Missouri.

Substantial research has been conducted on the economic profitability of irrigation on coarse textured soils in the humid Midwest. There has only been limited attention given to the irrigation of fine textured soils in the area. However, there is the potential for an economic response to irrigation on fine textured soils with a restricted zone for plant root development. A mathematical programming model of a micro farm unit was used in the study. The model maximizes net farm revenue by choosing production levels, subject to technical constraints between inputs and outputs, and an initial endowment of fixed resources. In addition to the basic model formulation, an investment model of alternative irrigation systems is incorporated. The model considers six alternative grain production activities including dryland corn, four alternative acreage levels of irrigated corn and soybeans. Irrigation application of six inches of water during July and August was an activity considered for irrigated cropland. The results indicated the average yield increase of corn of at least 40 bushels per acre per year or a discount rate of no more than 14 percent was necessary if an irrigation system was expected to provide a greater return than dryland corn production. AN APPRAISAL OF CULTURAL AND PALEONTOLOGICAL RESOURCES WITHIN SECTIONS 1 AND 2 OF THE PROPOSED MIRDAN CANAL PROJECT, GARFIELD AND VALLEY COUNTIES, NEBRASKA,
Nebraska Univ., Lincoln. Dept. of Anthropology.
N. S. King, and R. E. Pepperl.
Technical Report No 80-03, March 1980. Vol 1, 65 p, 1 Fig, 4 Tab, 74 Ref, 2 Append.

Descriptors: *Nebraska, *Archaeology, *Dating, *Surveys, Evaluation, History, Geologic history, Land use, Irrigation programs, Canal construction, Engineering, Inspection, Value.

Thirty-one locations of contemporary and early twentieth century material were identified in a cultural resources evaluation within sections 1 and 2 of the proposed Mirdan Canal project. The Mirdan Canal, designed to carry water from the Calmus Reservoir to the Davis Creek Reservoir, is part of a multi-purpose irrigation development within the North Loup Division, Nebraska. Steps involved in the survey included: (1) a records search, (2) a literature search, (3) National Register consultation, (4) paleontological records search and consultation, (5) county court records search, (6) field investigations, and (7) laboratory preparation and analysis of collected materials. Two separate field investigations were conducted, a reconnaissance level investigation of a one-acre seepage test and an intensive (100%) pedestrian survey of the entire area. In both surveys all accessible surface areas were systematically inspected and either zig-zag or straight line traverses were used depending on terrain and visibility. Some acreage was inaccessable but nearly 95% was completely surveyed. No paleontological or prehistoric Native American sites were located. In addition to the 31 contemporary and early twentieth century locations, 4 abandoned habitation sites and 23 isolated locations of discarded debris and dump areas were identified. Based on these results further investigations prior to construction are not recommended, however, construction crews should be made aware of the potential for encountering buried cultural resources. (Seigler-IPA)

FINAL REPORT ON SAMPLING AND EVALUATION OF ARCHAEOLOGICAL AND HISTORICAL SITES IN OR NEAR BUREAU OF RECLAMATION'S AUTHORIZED SALMON FALLS DIVISION, TWIN FALLS AND CASSIA COUNTRIES, IDAHO,
Idaho Museum of Natural History, Pocatello.
B. R. Butler, and P. R. Waite.
Archaeological Reports No 17, November 1978. 92 p, 42 Fig, 28 Tab, 15 Ref. 14-06-100-9135.

Descriptors: *Evaluation, *Archaeology, *Dating, *History, *Idaho, Human population, Land use, Surveys, Equipment, *Irrigation canals, Irrigation engineering, Irrigation programs, Diversion structures, Baseline studies.

Three seasons of archaeological survey and evaluation at the site of the proposed Salmon Falls Division irrigation project in Idaho identified eight aboriginal and four historical sites that may be damaged by the project. The project will involve the construction of a canal system running southwestward from the Milner Dam on the Snake River. The project will provide water to approximately 15,000 acres that are now dry. Only limited knowledge of the native people, the Shoshoni, is available. The eight aboriginal sites were all located within a 4 x 13 mile area across the northern end of the South Hills. These sites were evaluated by excavating a 1 m x 2 m pit in every 400 sq m sampling stratum mapped for each site. Data provided for each site include number of pits, number of cataloged artifacts, and number of waste flakes. At the sites lithic chipping debris strongly represents tool manufacturing and repair. From projectile point analysis two sites on Rock Creek were dated from the Early Archaic (5,800 B.C.-2,500 B.C.), while the other sites generally dated from the Middle Archaic (2,500 B.C.-A.D. 1,200-1,300). The four historical sites were evaluated by surface study only. Two of the historical sites are believed to be part of the many lateral tracks from the Oregon Trail. A third historical site was composed of broken glass along the bank of the irrigation canal and the fourth was the foundation of a turn of the century barn. While none of the sites are likely to yield much new information, disturbance of the sites should be avoided when possible. (Seigler-IPA)

WATER-MANAGEMENT PLANNING FOR ILLINOIS COMMUNITIES,
Illinois Univ. at Urbana-Champaign. Water Resources Center.
A. Weeks.
Report No UILU-WRC-79-0009, Special Report 9, July 1979. 97 p, 1 Fig, 6 Tab, 31 Ref. OSS 77-21209.

Descriptors: *Illinois, *Administration, *Water management(Applied), *Water utilization, Project planning, Soil erosion, Sedimentation, Water supply, Water rates, Water wells, Water resources development, Water policy, Land use, Economic feasibility.

Ten documents on water management and planning prepared as part of a series of community education programs in Illinois are presented as background material for community citizens and officials to provide a common denominator of knowledge. The documents presented are: (1) Introduction to Water-Management Planning, (2) Water Conservation, (3) Water Availability: Present Adequacy and Future Alternatives, (4) Water Quality and the Water System, (5) Management, Planning, and Maintenance of Municipally Owned Water Systems, (6) Economic Concerns and Financing of Water Systems, (7) Private Home Water Systems, (8) Areawide Options, (9) Soil Erosion, and (10) The Role of Water and Reservoirs in Economic Growth. Technical terms are avoided when possible and some costs are provided as a basis for comparisons. Five main aspects are involved in water-management planning: the quantity of water naturally available; the quality of available water; the adequacy, reliability, and maintenance of the water system; waste water treatment and reuse; and community needs and resources. Also, land use planning and water management must go together. Included at the end of each document is a list of questions to help a community find specifics about its own situation along with possible sources for answers. (Seigler-IPA)

OPTIMUM ALTERNATIVES FOR CONTROLLING COMBINED SEWAGE OVERFLOWS--A CASE STUDY,
Barr Engineering Co., Minneapolis, MN.
I. Yomtovian.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 129-146, 1978. 5 Fig, 2 Tab, 6 Ref. EPA C270831-2.

Descriptors: *Decision making, *Combined sewers, *Urban runoff, *Alternate planning, Overflow, Planning, Conveyance structures, Urban hydrology, Separated sewers, Bypasses, Water quality, Water pollution sources, Economics, Costs, Methodology, Analytical techniques, Dissolved oxygen, *Red Wing(MN), Case study, Sanitary sewage overflow.

The major concern of this study is the control and treatment of sanitary sewage overflows from the combined sewer systems located in Red Wing, Minnesota. Frequent high quantity untreated sanitary flows entering the Mississippi River (MR) at Red Wing are degrading the water quality of the river. The high rate of sanitary sewage overflow into the river is primarily due to the existence of the inadequate and poorly located sanitary sewer interceptors. The untreated sanitary sewage flow by-passes the existing treatment plant under the following three distinct conditions: (1) when the MR water elevation exceeds the invert elevation of the combined sewer systems; (2) when dry weather sanitary flows exceed the maximum intake capacity of the regulators; and (3) when the combined sanitary and storm runoff exceeds the maximum intake capacity of the regulators and the available storage capacity of the combined sewers. The optimum waste control measure is the combination of the most cost-effective alternatives which provide the most acceptable (desirable) waste control level. To facilitate the process of decision making in the selection of optimum alternatives, the following schemes were suggested: select the most cost-effective combination of alternatives based on the available budget, an acceptable percentage of waste control, and/or based on the waste control costs ($/MGY) spent in other cities comparable to Red Wing. EFFECTS OF RURAL WATER SYSTEMS ON LOCAL GOVERNMENT REVENUES AND EXPENDITURES IN SELECTED COUNTIES OF SOUTH DAKOTA,
South Dakota State Univ., Brookings. Dept. of Economics.
A. A. Lundeen, and L. L. Janssen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-188055, Price codes: A10 in paper copy, A01 in microfiche. South Dakota Water Resources Institute, South Dakota State University Completion Report 1979. 219 p, 2 Fig, 48 Tab, 25 Ref, 10 Append. OWRT B-056-SDAK(1), 14-34-0001-8118.

Descriptors: *Rural areas, *South Dakota, *Water distribution(Applied), *Government finance, Taxes, Economic analysis, Regression analysis, Surveys, Statistical methods, Population, Income analysis, Education, Mathematical models, Water systems.

Surveys and statistical analyses were used to evaluate the impact of the Brookings-Deuel Rural Water System on the revenues and expenditures of local governments in the area. Two mail surveys were used to gather demographic data and housing characteristics for the population and its subgroups in the area served by the water system. Chi-square, analysis of variance, and multiple regression tests were used to determine if significant differences existed. Personal interviews were conducted to gather information on housing, farming operations, consumer purchases, satisfaction with the water system, and perceptions of changes by the owners in their property value due to the water system. County officials, school district officials, realtors, and appraisers were also interviewed. Using the data collected a previously developed model was modified to simulate the effects of the rural water system on the public sector. The model can be used to estimate a range of impacts. Results show that farm or nonfarm employment and income orientation are related to system membership, rural user families are younger than nonuser families, users have higher income levels than nonusers, education levels of adults is not related to system use, and users have one or more children than nonusers. Approximately 40% of those surveyed felt that the water system increased the value of their land. Net positive gains were found for all but one unit of government. Gains in total property tax revenues from the increase in property value are not occurring and may not occur unless new assessments of property for tax purposes reflect this increase in value. (Seigler-IPA)

A DYNAMIC REGIONAL IMPACT ANALYSIS OF FEDERAL EXPENDITURES OF A WATER AND RELATED LAND RESOURCE PROJECT -- THE BOISE PROJECT OF IDAHO, PART II: SECONDARY ECONOMIC IMPACTS OF THE BOISE PROJECT OF IDAHO, 1947-1970,
Idaho Univ., Moscow. Dept. of Agricultural Economics.
R. B. Long, and C. J. Potratz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-191430, Price codes: A07 in paper copy, A01 in microfiche. Idaho Water Resources Research Institute, University of Idaho. Research Technical Completion Report, March 1979. Volume II of V. 118 p, 21 Fig, 6 Tab, 19 Ref, 7 Append. OWRT C-6276 (No 5226)(3).

Descriptors: *Idaho, *Economic impact, *Input-output analysis, *Irrigation systems, Economics, Mathematical studies, Food processing industry, Industries, Cost-benefit ratio, Cost repayment, Econometrics, Benefits, Annual costs, Financial analysis, Monetary benefits, Boise Project.

Secondary or induced economic impacts resulting from the Boise Project, an irrigation and power project in southwestern Idaho, are analyzed. The Project was built by the Bureau of Reclamation between 1910 and 1956 and is now managed for irrigation, power, recreation, and flood control. The Project has produced a thriving irrigated agricultural production area of approximately 340,000 acres as of 1970. This agricultural production in turn has resulted in the growth of supplying (input) industries and agricultural (output) processing industries. An aggregate economic input-output model is used to simulate the impact of the Boise Project on the Idaho economy. Results indicate that direct income impacts increased from $17.9 million in 1947 to $28.1 million in 1970. For the same time period indirect or secondary impacts increased from $45.9 million to $99.1 million. Since 1947 the total impact of the project on regional income has dropped from 41.4% to 22.1% which shows that the region is expanding more rapidly than the Project. The Project has had a major influence on the development and growth of the area's food processing industry. In 1970 the food processing industry's economic impact ($143.7 million) was greater than the Project's economic impact ($127.2 million). Also as of 1970, annual project impact both direct ($28.1 million) and indirect ($99.1 million) more than repay the annual Project costs of $5.5 million. (Seigler-IPA)

SECOND HOMES IN NORTH CAROLINA: AN ANALYSIS OF WATER RESOURCE AND OTHER CONSEQUENCES OF RECREATIONAL LAND DEVELOPMENT,
North Carolina Univ. at Chapel Hill. Center for Urban and Regional Studies.
R. J. Burby.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-190648, Price codes: A12 in paper copy, A01 in microfiche. Water Resources Research Institute of the University of North Carolina, Raleigh. Report No UNC-WRRI-79-150, December 1979. 278 p, 43 Tab, 137 Ref, 4 Append. OWRT A-092-NC(3).

Descriptors: *Land use, *North Carolina, *Recreation facilities, *Land development, Environmental effects, Recreational demand, Cost-Benefit analysis, Economics, Erosion, Septic tanks, Mountains, Coasts, Land management, Land resources, Recreation.

The environmental impact of recreational land development was studied in 18 mountain and 20 coastal counties in North Carolina. North Carolina has experienced a boom in second homes and recreational land development; however, 40% of this development is concentrated in only 5 of the 38 counties studied. Three sources of data were used for the study: (1) secondary data from the Office of Interstate Land Sales Registration; (2) original data from mail questionnaires returned by 71 development firms in the state; and (3) original data from two waves of personal interviews with a sample of 227 local officials. Environmental, social, fiscal, and economic consequences of development were identified. Local public officials of the developed areas overwhelmingly believe that development has been beneficial to their counties due to positive economic consequences. A conceptual model was developed to explain how the objective characteristics of the environmental impacts are associated with officials' perceptions of those atributes. Problems associated with development include septic tank failures, pollution, erosion, roadside litter, inadequate access, traffic congestion, and flooding. Adverse economic effects include steeply escalating land prices and increased demand for public services. Both coast and mountain officials feel that existing local and state institutions could do more to promote improved land development practices. Increased citizen awareness would also be a positive step. (Seigler-IPA)

LAKE SUPERIOR IN THE 21ST CENTURY,

Canada Centre for Inland Waters, Burlington (Ontario).
H. Shear.
Journal of Great Lakes Research, Vol 4, No 3-4, p 550-553, December 1978. 3 Tab, 7 Ref.

Descriptors: *Lake Superior, *Projections, *Population, *Economics, Land use, Phosphorus, Waste disposal, Water pollution sources, Fisheries, Agriculture, Industries, Mining, Forestry, Twenty-first century.

Projections of population, industrial growth, phosphorus inputs, changes in land use patterns and waste disposal are given. Phosphorus loadings to Lake Superior from point sources are projected to increase only slightly by the year 2020, assuming all large sewage treatment plants meet a 1 mg/l effluent limitation. Increases in industrial and mining activities could have significant negative impacts on the lake, but these impacts have not been quantified. The Great Lakes community has adopted a philosophy of no further degradation of Lake Superior. In order to achieve this, more efficient and innovative methods will have to be employed to ensure that pollutants do not enter the lake from industrial discharges, municipal sewage treatment plants, urban runoff, and runoff from waste disposal sites. (Humphreys-ISWS)

FRANCE: WHERE THE METER IS 'UNIVERSAL',
L. Freeman.
Water, No 31, p 43-44, March 1980. 4 Fig.

Descriptors: *France, *Water supply, *Water costs, *Water rates, Water distribution(Applied), Potable water, Water purification, Ozone, Potable water, Environmental sanitation, Sewage disposal, Taxes, Costs, Water meters.

The French water industry continues to move forward with services, billing, and the supplying of potable water. The industry has used meters since its establishment in the early 19th century. The industry also provides all the sanitation services. Not only does the consumer pay for water and sanitation services, he also pays several taxes such as a value added tax (VAT) of 7%, a tax to subsidize services to rural communities, and local taxes. Approximately 40% of a customers bill is for water supplied while 60% goes for taxes. These taxes have approximately doubled the customer's cost in the last few decades. The average annual bill for a family of four is about 800 Francs. France has five major water companies that supply a total of 1,500 million cubic meters a year. The oldest company, Compagnie Generale des Eaux, provides approximately 5 million cubic meters daily. All the French water companies use ozone rather than chlorine for purification. A large ozonization plant at Choisy-le-Roi near Paris produces 800,000 cubic meters daily. Despite the current use of a metering system, the industry does have problems with reading them. Future developments include the use of remote reading using computers and cable television linkups. (Seigler-IPA)

6D. Water Demand

REPORT OF THE RIVER MASTER OF THE DELAWARE RIVER FOR THE PERIOD DECEMBER 1, 1977 -- NOVEMBER 30, 1978,
Geological Survey, Reston, VA. Water Resources Div.
F. T. Schaefer, and R. E. Fish.
Geological Survey Delaware River Master report, 1979. 94 p, 6 Fig, 1 Plate, 20 Tab.

Descriptors: *Delaware River, *Watershed management, *Available water, *Water delivery, *Water quality, Reservoir storage, Reservoir releases, Estuaries, Saline water intrusion, Monitoring, *Delaware River Master, Annual report.

This annual report of the River Master of the Delaware River is for the year December 1, 1977, to November 30, 1978. In terms of water supply, the year was above normal. The discharge of the Delaware River at Montague, New Jersey, adjusted for diversions and changes in reservoir storage, was 14 percent above median. Total combined storage in Pepacton, Cannonsville, and Neversink Reservoirs was 98.0 percent of capacity on December 1, 1977, as compared with 87.9 percent a year earlier. This was the highest total storage at the beginning of any report year since the construction of the reservoirs. Diversions for water supply for New York City and releases to maintain the flow of the Delaware River at Montague were made under the supervision of the River Master, as provided in the terms of the Amended Decree of the Supreme Court, June 7, 1954. Diversions through the Delaware & Raritan Canal in New Jersey did not exceed the limits imposed in Section V of the Decree. Data from the Water-quality monitoring program carried out by the U.S. Geological Survey in the Delaware River Estuary are included. (Kosco-USGS)
W80-05292

AVAILABILITY OF SUPPLEMENTAL WATER SUPPLIES AT SALMONID FISH-PROPAGATION STATIONS IN WISCONSIN,
Geological Survey, Madison, WI. Water Resources Div.
C. A. Harr, and R. P. Novitzki.
Available from: OFSS, Box 25425, Fed Ctr, Denver CO 80225. Price codes: $2.00 in paper copy, $4.00 in microfiche. Geological Survey open-file report 79-1170, October 1979. 13 p, 5 Fig, 4 Tab, 3 Ref.

Descriptors: *Groundwater availability, *Surface water availability, *Water supply, *Fish hatcheries, Streamflow, Flow characteristics, Diversion, Impoundments, Aquifers, Wells, Water yield, Pumping, Estimating, Digital computers, Drawdown, Water quality, Wisconsin, *Salmonid fish-propagation stations, Supplemental water supplies.

Supplemental water supplies are available at all the 12 fish-propagation stations. At seven of the stations water may be obtained by diverting or impounding streams. Ground water is available from glacial sand-and-gravel aquifers at all the stations and from sandstone aquifers at 7 of the 12 stations. Probable well yields range from 100 to 1,000 gallons per minute from the sand and gravel and from 50 to 1,000 gallons per minute from the sandstone. The response of pumping 1,600 gallons per minute from a ground-water source at Crystal Springs, Langlade, Nevin, and Osceola was estimated by a digital model. Estimated drawdown after 10 years of pumping ranged from 10 to 28 feet (6 to 35 percent of the saturated thickness of the aquifers). (Kosco-USGS)

6E. Water Law and Institutions

AN EVALUATION OF ILLINOIS LAWS AND REGULATIONS RELATED TO THE QUALITY OF GROUND WATER.
Illinois Univ. at Urbana-Champaign.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-183528, Price codes: A06 in paper copy, A01 in microfiche. Report, June 1979. 110 p, 2 Tab.

Descriptors: *Illinois, *Reviews, *Groundwater, *Legislation, *Water law, Water pollution control, Water quality, Legal review, Regulation, Administration, Water utilization, Water policy, Water pollution sources, Water quality standards, Institutions, Water permits, Permits, Waste water disposal, Waste disposal wells, Waste disposal.

This study contains an analysis of existing Illinois statutes, administrative regulations, and policies and practices affecting the quality of groundwater, together with recommendations for changes needed to establish a comprehensive groundwater protection program for the state. Some principal tasks of the research were to: (1) identify regulatory deficiencies, gaps, and overlaps, (2) examine federal laws, regulations, and court decisions to determine requirements applicable to state control of groundwater pollution, and (3) recommend modifications of Illinois statutes, regulations, policies, and implementation practices to achieve a comprehensive and effective program. The following eight proposals were made: (1) adopt a policy to protect groundwater quality, (2) designate an agency with primary responsibility for groundwater quality, (3) develop a groundwater data base, (4) develop a groundwater quality monitoring program, (5) establish groundwater quality standards, (6) regulate water use to control groundwater quality, (7) control surface water quality, and (8) develop specific standards, permits, and management practices for specific activities causing groundwater pollution. Recommendations were also made for control of specific pollution sources, with priority rankings, for the form of the proposed control, e.g., legislation, regulation, or administrative practice, and for the identity of agencies whose authority would be exercised, increased, or decreased if the proposal were implemented. TURN THIS WATER INTO GOLD THE STORY OF THE NEWLANDS PROJECT,
Nevada Historical Society, Reno.
J. M. Townley.
1977, 160 p, Nevada Historical Society, Reno. OWRT A-074-NEV(4), 14-34-0001-7060.

Descriptors: *Irrigation districts, *History, *Federal reclamation law, *Nevada, Water resources development, Land resources, Irrigation systems, U.S. Bureau of Reclamation, *Truckee-Carson Irrigation District(NV), Churchill County(NV), Federal Reclamation Act of 1902.

This book is primarily a biography of the first federal reclamation district in the U.S. The Truckee-Carson Irrigation District is a cooperating organization composed of members, geographical areas, numerous dams, canals, reservoirs and electrical plants, farms, dairies, cattle feeding operations, residential communities and recreation-wildlife sanctuaries. The year 1976 marked the 50th anniversary of self-rule for this district. In 1926 the U.S. Bureau of Reclamation transferred control to the newly formed TCID (Truckee-Carson Irrigation District). The book, replete with photographs, traces the history of the area from the 1800's to 1976 and documents the many problems faced by the irrigation district since the National Reclamation Act of 1902. (Smith-Nevada)

RECLAMATION AND THE RED MAN: RELATIONSHIPS ON THE TRUCKEE-CARSON PROJECT, NEVADA,
Nevada Historical Society, Reno.
J. M. Townley.
The Indian Historian, Vol 11, No 1, p 21-28, 1978.
OWRT A-074-NEV(3), 14-34-0001-7060.

Descriptors: *Paiute Indians, *Indian reservations, *Reclamation, *Irrigation, *Water rights, Legal aspects, Nevada, Truckee-Carson Irrigation District(NV), U.S. Reclamation Service.

This article traces the developing relationships among the U.S. Reclamation Service (USRS), formed in 1902 as a progressive measure, the white entryman, and the Indian during the period 1903 to 1926, at which time operational control of the federally funded reclamation project passed to the locally-directed TCID (Truckee-Carson Irrigation District), Nevada. The Indians of Lahontan Valley, as well as those around Pyramid Lake, were very much affected by the Truckee-Carson Project, and a series of court cases followed. Between 1903 and 1926 decisions imposed by USRS and Congress took about 30,000 acres from Paiute allottees in exchange for ten-acre plots within a reservation composed of only seven sections. The history of attempts to settle the Indians on the reservations and the conditions therein are described. (Smith-Nevada)

THE URBAN COAST FROM A NATIONAL PERSPECTIVE,
National Oceanic and Atmospheric Administration, Office of Coastal Zone Management.
A. B. Cowey.
Coastal Zone Management Journal, Vol 6, No 2/3, p 135-165, 1979. 2 Maps.

Descriptors: *Coasts, *Shore protection, *Public access, *Urbanization, Federal government, Environmental effects, Administrative agencies, Resources development, Legislation, Ecology, Management.

Nearly 40% of the United States population is concentrated in coastal urban centers whose populations exceed 500,000. The pressures for new housing, tourist, and recreational facilities, as well as environmental concerns, have contributed to intra-urban conflict over the direction and appropriate mix of waterfront uses. To date, no one federal agency or program has been specifically charged with overseeing the urban coastal resource as an entity, nor is it likely that one will. However, national concern for various aspects of the urban coastal issues has been expressed. In 1972, the Coastal Zone Management Act declared a national interest in the effective management, beneficial use, protection and development of the coastal zone. A national involvement can also be traced through a number of federal activities. These include the Urban Recreation Study, the Urban Waterfront Study, the Maritime Preservation Program, shorefront access and planning, and the implementation of State Coastal Zone programs. (Wilson-Florida)

THE LOST WATERFRONT OF NEW YORK,
New York Univ., NY. Graduate School of Public Administration.
M. L. Moss.
Coastal Zone Management Journal, Vol 6, No 2/3, p 167-185, 1979. 2 Tab.

Descriptors: *New York, *Shore protection, *Local governments, Urbanization, Water law, Land use, Programs, Administrative agencies, Public access, Planning, Management.

The New York City (NYC) waterfront differs dramatically from most urban coastal areas in the United States. In size its shoreline is far more extensive than any other city's. Municipal ownership of much of the waterfront gives the city direct control over the use of substantial portions of abutting land. No integrated policy exists for managing the NYC waterfront. Municipal government has done little to improve the shoreline. Citizens' groups and other organizations have made the greatest effort to improve the use of the city's coastal resources. NYC needs a well-defined policy for formulating and implementing programs in the coastal zone. An initial step for the city is to establish an accurate, reliable and up-to-date information system for the waterfront property it owns. Second, the city needs to develop a program for increasing public access to the waterfront. Third, more attention and assistance must be given to local groups. Finally, the city must press for an urban perspective in coastal management with external agencies. (Wilson-Florida)
W80-05364

ENERGY FACILITY SITING IN THE URBAN COASTAL ZONE: COMPATIBLE OR NOT,
Princeton Univ., NJ.
D. L. Morell.
Coastal Zone Management Journal, Vol 6, No 2-3, p 215-232, 1979. 2 Fig.

Descriptors: *Energy, *Facilities, *Coasts, *Shore protection, Water law, Environmental effects, Sites, Power operation and maintenance, Cooling water, Public access, Oil industry, Water pollution.

In recent years a rural/urban coastal dichotomy has emerged. This has been especially prominent in the siting of energy facilities since these operations are often water dependent. Power plants need huge amounts of cooling water. Offshore oil and gas extraction requires onshore support facilities. Recently, this issue has gaines special prominence on the East Coast with the commencement of offshore oil and gas exploration. A case study was conducted in Hudson County, New Jersey, in New York harbor, where five oil-related facility proposals were rejected from 1972 to 1976, primarily due to citizen opposition. Citizen activists now see the urban waterfront as a special place to which they want access. Amenity uses are preferred over a continuation of past, almost exclusive, industrial development. Citizen opposition is primarily concerned with pollution and safety. Innovative siting which utilizes inland, rather than coastal, locations is suggested as one way to lessen urban/rural siting controversy. (Wilson-Florida)
W80-05365

COASTAL ZONE MANAGEMENT: THE FIRST FIVE YEARS AND BEYOND,
National Oceanic and Atmospheric Administration, Washington, DC.
R. W. Knecht.
Coastal Zone Management Journal, Vol 6, No 4, p 259-272, 1979.

Descriptors: *Coasts, *Shore protection, *Federal government, State governments, Wetlands, Resources development, Public access, Inter-agency cooperation, Administrative agencies, Legislation, Environmental control, Management.

More than five years have passed since the Office of Coastal Zone Management issued the first coastal zone management (CZM) program development grants. Since then, all 35 coastal states and territories have participated in the program. By spring 1980, more than 75% of the country's shoreline will be covered by federally approved management plans. Any examination of the national CZM program involves consideration of the record at the state and local levels. Substantive results are expected in four major areas. First, and foremost, is protection of such natural resources as wetlands, beaches, dunes, and barrier islands. Second is the concern for more effective coastal development management. A Third area is increasing recreational access to the coast. Fourth is an emphasis on increasing intergovernmental cooperation and coordination. Today the emphasis of the CZM program is shifting from planning to implementation. A proposed amendment to section 303(b) of the Coastal Zone Management Act will clearly incorporate full consideration of national needs during the implementation of CZM programs. (Wilson-Florida)

A PETROLEUM INDUSTRY PERSPECTIVE ON FEDERAL COASTAL ZONE MANAGEMENT,
American Petroleum Inst., Washington, DC.
S. P. Chamberlain.
Coastal Zone Management Journal, Vol 6, No 4, p 281-294, 1979.

Descriptors: *Oil industry, *Federal government, *Land use, *Shore protection, Coasts, Programs, Administrative agencies, Legislation, State governments, Regulations, Environmental control, Energy.

Two of the most ambitious provisions of the Coastal Zone Management Act (CZMA) require consideration of national interests in facility siting and federal consistency with approved state programs. The petroleum industry is most concerned with the federal consistency requirement which allows state coastal management policies to assume the force of federal law by virtue of the National Oceanic and Atmospheric Administration's (NOAA) approval of a state coastal zone management program. Moreover, the comples federal consistency procedures under CZMA are counter-productive to the expressed purpose of the Outer Continental Shelf Lands Act. The petroleum industry's secondary concern is NOAA's interpretive changes of the Act and its regulations which allow state programs approval based on inadequate state statutory and regulatory frameworks. This has occured where states give inadequate consideration to the national interest, unwilling to adopt stronger oversight control over local land-use decisions as required by the CZMA. Strong Congressional reaffirmation of CZMA's intent is needed to redirect NOAA's implementation of the Act. (Wilson-Florida)
W80-05367

UNRESOLVED ISSUES OF COASTAL ZONE MANAGEMENT,
Rose, Schmidt, Dixon, Hasley, Whyte and Hardesty, Washington, DC.
J. R. Spradley, Jr.
Coastal Zone Management Journal, Vol 6, No 4, p 303-310, 1979.

Descriptors: *Energy, *Shore protection, *Facilities, *Resources development, Coasts, Administrative agencies, Oil industry, Sites, Programs, Planning, Land use, Legislation.

The Coastal Zone Management Act (Act) has been subjected to conflicting claims of inadequacy, by both governmental agencies and private users of the coastal zone, such as the electric utility and petroleum industries. Electric energy facilities are of national and state interest but of regional and local benefit. Once the need for a facility has been determined, industry is concerned with management of environmental impacts from these facilities. Section 307 of the Act covers federal agency activities and development projects, requiring federal agency actions be consistent. Coastal interests have differing concerns regarding federal consistency. The most immediate impact of federal consistency on the electric utility industry is its application to existing facilities. Section 306(c) (8) of the Act requires that each state program give adequate consideration to national interests in planning and siting energy facilities. However, regulations of the National Oceanic and Atmospheric Administration discourages consideration of the national interest in energy facilities. Congressional clarification or amendment is necessary to limit application of federal consistency to new facilities and to properly balance coastal resources with the need for energy facilities. (Wilson-Florida)

INDIAN RESERVED WATER RIGHTS: THE WINTERS OF OUR DISCONTENT.
Yale Law Journal, Vol 88, No 8, p 1689-1712, July 1979.

Descriptors: *Water rights, *Indian reservations, *Reservation doctrine, Prior appropriation, Judicial decisions, Water users, Water shortage, Economic impact, Regional development, Resource allocation, Resources development.

Enormous Indian water claims will strikingly affect the economic futures of both the Indians and the western states. Unfortunately, legal uncertainty about Indian water rights impedes future western growth and threatens Indian aspirations for economic improvement. The Supreme Court in 1908 recognized an implied water right, independent of state law, associated with Indian reservations. Most Indian reserved rights have never been officially quantified. Indians are now demanding larger amounts of water than previously used, extending claims beyond available supplies and threatening the rights of current non-Indian water users. The legal uncertainty of Indian water rights impairs public water planning, distorts water investment decisions and handicaps negotiations important to Indian economic development. Possible avenues for defining the scope of Indian reserved rights - administrative, legislative, and judicial decision-making- are evaluated. As a first step in resolving the Indian water dilemma, the federal courts must define the scope of Indian reserved water rights. (Daniels-Florida)

MANAGING A LIMITED RESOURCE: THE POLITICAL CONSTRAINTS ON WATER POLICY IN THE FOUR-CORNERS STATES,
Arizona Univ., Tucson.
H. Ingram, N. Laney, and J. R. McCain.
Utah Law Review, Vol 1979, No 4, p 719-745, 1979. 17 Tab.

Descriptors: *Water allocation(Policy), *Political aspects, *Water policy, *Federal-state water rights conflicts, Surveys, Energy, Federal government, State governments, Reclamation, Water rights, Public rights, Federal project policy.

Westerners feel abundant water is the key to economic prosperity, and so important to the quality of life that it must be made available to everyone. Such views underlie the distributive water politics that have resulted in Congress' authorizing and funding of scores of large-scale reclamation projects through a process of log-rolling and mutual accomodation. If past practices of federal dominance in planning and financing of projects is to change, the role of state governments will be crucial. Data reveals that both voters and state legislators tend to favor future water allocation on the same basis as the present. Some differences between senators' and voters' opinions about water emerge. Legislators are more willing to change water allocations among users. However there is little constituency incentive for legislators to take positive action in water policy. If the direction of water politics is left to the residents of western states and their elected state representatives, there may be little change from past policy. (Wilson-Florida)
W80-05370

COASTAL ENERGY IMPACT PROGRAM BOUNDARIES ON THE ATLANTIC COAST: A CASE STUDY OF THE LAW APPLICABLE TO LATERAL SEAWARD BOUNDARIES,
D. R. Christie.
Virginia Journal of International Law, Vol 19, No 4, p 841-882, Summer 1979. 2 Fig.

Descriptors: *Boundaries(Property), *State jurisdiction, *Oceans, *Boundary disputes, State government, Federal government, International law, Law of the sea, Legal aspects, Legislation, Judicial decisions, Monetary benefits.

Interstate seaward boundaries are important in questions of conflicts of law and in allocation of funds under the Coastal Energy Impact Program (CEIP). If no state seaward boundary exists, a state's adjacent continental shelf acreage is determined according to applicable principles of law. These include specifically the Convention on the Territorial Sea and the Contiguous Zone and, generally, international law, United States (U.S.) statutory and case law, and conventions. International, national and the individual states legal positions concerning the extension of state boundaries are discussed with possible solutions to the boundary dilemma included. Inconsistencies might arise between boundary delimitations for CEIP allocations and for state law under the Outer Continental Shelf Lands Act.Boundary drawing as a method for allocating CEIP funds is analyzed. This method is inadequate to meet the stated purposes of the CEIP and has created needless administrative confusion. (Daniels-Florida)

GEOTHERMAL DEVELOPMENT AND WESTERN WATER LAW,
O'Melveny and Myers, Los Angeles, CA.
O. Olpin, A. D. Tarlock, and C. F. Austin.
Utah Law Review, Vol 1979, No 4, p 773-887, 1979. 7 Fig.

Descriptors: *Geothermal studies, *Energy, *Resources development, *State governments, Groundwater resources, Mining, Subsurface investigations, Federal Government, Legal aspects, Energy conversion, Geology.

Geothermal resources currently occupy a small place in United States energy policy. Various estimates of the geothermal potential state that geothermal resources could provide as much as 100,000 megawatts of electrical power for thirty years. Geothermal resources are located primarily in the far west. To exploit a natural resource, some property right in the resource must be established. The laws of hard rock minerals, oil and gas, and water do not provide suitable analogies, because the geothermal resource is direct heat energy ready to be put to use. Several surface owners may be able to tap a common supply, but the supply may be interconnected with other natural resources. It will be undesirable to regulate geothermal resources merely as groundwater resources. The federal government and thirteen western states have some regulation of geothermal development. Applicable state property law for geothermal resources will apply to development on state and privately held land. Conflicts between federal geothermal leases and conventional water users raise more difficult issues. (Wilson-Florida)

CARACAS, 1974: INTERNATIONAL REGULATION OF OCEAN ECOLOGY.
Golden Gate Law Review, Vol 5, No 2, p 325-365, Spring 1975.

Descriptors: *Water Pollution Control, *Law of the sea, *Oceans, *Oil pollution, Water pollution sources, Sea water, United Nations, International waters, Waste disposal, International law, Treaties.

The purpose of the 1974 Third United Nations Law of the Sea Conference was to achieve international implementation and agreement for dealing with marine pollution. To define the scope of marine pollution problems, previous attempts at effective control are analyzed. During the 1974 Conference, various draft texts were prepared by subcommittees to form the basis for international agreement on marine environment preservation. No consensus was reached, and the likelihood of a meaningful agreement on pollution control is remote. Nations wishing to act affirmatively must rely on existing conventions and general principles of international law. Increased unilateral action may result with marine pollution control falling victim to expanded claims of ocean jurisdiction by individual nations. This and other possible results of a sluggish international authority are discussed. Alternatives to a world oceans treaty are suggested. (Schwerer-Florida)

FEDERAL CONTROL OF WATER POLLUTION - AN OUNCE OF PREVENTION IS WORTH A POUND OF CURE,
Levine and Krom, Beverly Hills.
S. B. Levine.
Beverly Hills Bar Association Journal, Vol 9, No 3, p 34-39, May-June 1975.

Descriptors: *Federal Water Pollution Control Act, *Economic impact, *Water pollution control, Economic efficiency, Industrial wastes, Legislation, Water pollution, Water pollution sources, Water quality control, Effluents, Regulation.

The decade of the 1970's may be considered a pivatal period for improving the environment through the 1972 Federal Water Pollution Control Act Amendments (Act). Major provisions of the new amendments are: (1) a national goal to eliminate pollutant discharge by 1985; (2) construction of publicly-owned waste reatment facilities; (3) limitations on point source effluents; and (4) mandatory permits for pollution sources. As regulations are issued and legal action instituted pursuant to the amendments, there is increased concern about the need for reliable information on the economic costs of implementing the Act. For example, what are the costs in terms of consumer prices, job losses, relocation and inflation: The issue is whether achieving enhanced water quality is commensurate with the investment of public and private funds. Although management will be somewhat hampered by government involvement in industry and pollution control will obviously cost money, there is no viable alternative to an effective effort to clean up our environment. (Wilson-Florida)

COMMENTS ON 'FEDERAL RESERVED WATER RIGHTS',
Debevoise and Liberman, Washington, DC.
J. C. Muys.
Denver Law Journal, Vol 54, No 3-4, p 493-498, 1977.

Descriptors: *Reservation doctrine, *Federal-state water rights conflicts, *Water resources development, Planning, Administrative agencies, State governments, Water rights, Water resources, Water allocation(Policy), Water demand.

In its 1970 report to Congress and the President, the Public Land Law Review Commission evaluated the problems posed by the federal water rights reservation doctrine. The doctrine may disrupt established water right priority systems and destroy vested water rights under state law. Moreover, the uncertainty generated is an impediment to sound planning for future water resources development. Legislative action is needed to dispel this uncertainty and provide the basis for cooperative water resources development planning between the federal government and the state with federal lands. This legislation should include: (1) a requirement that federal land agencies ascertain and give notice of their projected water requirements for the next forty years; (2) establishment of a procedure for determining the reasonableness of diverted water quantities; (3) require, as a condition to claims of reserved water rights, a statement of prospective water requirements, and (4) compensation where utilization of the implied reservation doctrine interferes with vested state water rights. (Wilson-Florida)

A REAL LIVE PROBLEM OR TWO FOR THE WANING ENERGIES OF FRANK J. TRELEASE,
Washington Univ., Seattle.
C. Corker.
Denver Law Journal, Vol 54, No 3-4, p 499-505, 1977.

Descriptors: *Reservation doctrine, *Water allocation(Policy), *Federal-state water rights conflicts, Legal aspects, Federal government, Water policy, Diversion, Administrative agencies, State governments, Federal reservations.

All the water diverted as a reslt of the reservation doctrine, excluding Indian water rights, is minimal. The reservation doctrine is essentially mythical for two reasons. First, all water rights have to be administered. Federal officials and agencies have never been created to administer water rights. Federal judges cannot administer water rights without a federal administrator. On the other hand, every state where water is scarce has adopted and administered such a system. Second, water law is not a discrete and separate branch of the law, but is a part of real property law. Most transfers of water rights are accompanied by transfers of land. Practically, if not conceptually, real property law is far beyond the power of Congressional preemption. Moreover, there is no general federal common law. There is no direct danger to water rights as a result of the reservation doctrine. There may be danger instead to the federal system. (Wilson-Florida)
W80-05376

SAVING THE COAST: THE CALIFORNIA COASTAL ZONE CONSERVATION ACT OF 1972.
Golden Gate Law Review, Vol 4, No 2, p 307-352, Spring 1974.

Descriptors: *California, *Shore protection, *Conservation, *Zoning, Shores, Land development, Resources development, Seashores, Coastal plains, Legislation, Permits.

The 1972 California Coastal Zone Conservation Act (CCZCA) is a public response to widespread construction along the California coastline. Although most of the coastline is privately held, California citizens and the courts are recognizing a valid public interest in coastal resources. To protect coastal resources until a comprehensive plan can be developed, an interim permit procedure has been established. Analyzed are the interim permit control provisions of the CCZCA, with particular emphasis on: (1) the necessity of compliance with permit provisions; (2) types of permits required; (3) criteria for approval or disapproval of permit applications; and (4) constitutional issues raised by the CCZCA. At the end of the planning phase a permanent coastal commission will be established to monitor development and update plans. The final coastal regulation plan should withstand judicial scrutiny. (Schwerer-Florida)

COASTAL LAND MANAGEMENT IN CALIFORNIA,
Houston Univ., TX.
G. L. Finnell, Jr.
American Bar Foundation Research Journal, Vol 1978, No 4, p 647-750, Fall 1978.

Descriptors: *California, *Land use, *Coasts, *Shore protection, Legislation, State governments, Coastal engineering, Management, Administrative agencies, Local governments, Regulation.

The nation's most significant experiment in coastal land management, the one likely to affect the most people's lives, is now under way in California. The program will most likely have national, and perhaps even international, consequences. The 1976 California Coastal Act (1976 Act) continues a coastal planning and regulatory process that began in 1972 when California's citizens approved Proposition 20. Proposition 20 resulted in the creation of the California Coastal Zone Conservation Commission and six regional commissions to accomplish two major objectives: (1) study the coastal zone and prepare the California Zone Conservation Plan; and (2) regulate development by permit in the coastal zone during the studying and planning period. The 1976 Act continues the two functions of coastal plan preparation and interim regulation started in 1972. But local governments are given a stronger role under the 1976 Act, which only sets forth general policies, directing local governments to prepare a local coastal program. The completed local coastal program is submitted to the regional commission that certifies program conformity with the policies of the 1976 Act. (Wilson-Florida)

PROBLEMS AND PROSPECTS OF COASTAL ZONE MANAGEMENT: AN ENVIRONMENTAL VIEWPOINT,
Natural Resources Defense Council, New York.
S. Chasis.
Coastal Zone Management Journal, Vol 6, No 4, p 273-280, 1979.

Descriptors: *Coasts, *Shore protection, *Land use, Federal government, Legislation, Decision-making, Environmental effects, Administrative decisions, Administration, State governments, Local governments.

The 1972 Coastal Zone Management Act (Act) is not effectively addressing the problems Congress recognized when the law was passed. It is not ensuring protection of our valuable coastal resources, mainly because the Act has been interpreted as a neutral planning process which emphasizes decision-making procedures at the expense of policy substance. Planning and management do not exist for their own sakes; procedures without substantive content are meaningless. Many states structures now exist that begin to deal with coastal problems. Current management problems are discussed, and recommendations to strengthen coastal zone management programs are presented. One source of the problems is the statute itself - the stated purposes are too broad. Also, implementation at the federal and state level has not been as vigorous as it should have been. More vigorous implementation is necessary to ensure the original goals of the Act are met. A national policy must be established and implemented. The principles on which such a policy should be based are listed. (Daniels-Florida)

PROLEGOMENA TO THE DISPUTES SETTLEMENT PART OF THE LAW OF THE SEA CONVENTION,
A. O. Adede.
New York University Journal of International Law and Politics, Vol 10, No 2, p 253-393, Fall 1977. 2 App.

Descriptors: *Law of the sea, *United Nations, *Remedies, Treaties, Conferences, Decision-making, International law, International waters, Water law, Negotiations.

Most of the substantive treaty negotiations before the United Nations Conference (Conference) on the Law of the Sea have been undertaken in informal meetings of the Conference committees. This article provides an analysis of Part XV of the current draft Law of the Sea Convention (The Informal Composite Negotiating Text) which deals with disputes settlement. Documents containing draft articles on the subject of disputes settlement produced by each session of the Conference are analyzed. The key issues are identified, and their treatment is analyzed at the various stages of the negotiations. Disputes settlement was dealt with in two stages at the Conference. First was the work of the Informal Working Group. The second stage was the informal meetings of the plenary Conference representing the official treatment of the subject. The Informal Working Group made a significant contribution to the development of the disputes settlement treaty articles. (Daniels-Florida)

STATE-LOCAL RELATIONS IN COASTAL ZONE MANAGEMENT IMPLICATIONS FOR CHANGE,
California Univ., San Diego. Inst. of Marine Resources.
J. Sorensen.
Coastal Zone Management Journal, Vol 6, No 4, p 295-302, 1979.

Descriptors: *State governments, *Local governments, *Governmental interrelations, *Shore protection, Federal government, Legislation, Coordination, Coasts, Planning, Management, Land use.

Changes in intergovernmental relations have been one of the main effects of the Coastal Zone Management Act (Act). A rearrangement in state-local government relations is one of the Act's major achievements. However, state-local relations could be improved by legislative amendments. One type of arrangement dominates the state-local relationships: Collaborative Planning Process (CPP). The CPP is not the most appropriate coastal management implementation arrangement for all states. The Act should be redrafted to clarify Congressional intent in coastal zone management. The Act should recommend to states using or considering CPP that the process incorporates three additional state powers. Additional amendments should require the Office of Coastal Zone Management to review substantial changes in local coastal plan components of a state's approved program. The Act's two greatest impacts, in states with CPP, have been to improve local governments planning capabilities and improved communication between state and local governments. (Daniels-Florida)

MANAGEMENT OF LIVING RESOURCES IN THE NORTHEAST PACIFIC AND THE UNILATERAL EXTENSION OF THE 200-MILE FISHERIES ZONE,
Washington Univ., Seattle. Inst. for Marine Studies.
D. Fluharty, and C. Dawson.
Ocean Development and International Law Journal, Vol 6, p 1-72, 1979. 19 Tab, 1 Bib.

Descriptors: *Jurisdiction, *Resources development, *Fisheries, *Law of the Sea, Resources allocation, International waters, International Law, Regional analysis, Regional development, Management, Resources, Oceans.

The emergence of a 200-mile economic zone, within which coastal states have exclusive control over marine resources, scientific research and pollution, will produce immediate and interacting effects. The need will intensify for increased bilateral and multilateral consultations, and a new level of coordination to cope with impending changes in use patterns. Recent demands for expanded jurisdiction seldom consider the policies and organizational networks needed for coordinated management and conflict resolution on regional or subregional levels. The need for a policy-oriented approach to multiple usage problems is addressed, with the world's oceans divided into marine regions. A marine regiona is a marine area in which the pattern of management problems posed by different activities is at least analytically separable from the rest of the world ocean. With the North Pacific Ocean as an example, the different approaches are analyzed which coastal states within marine regions can use to determine 'net benefit', corrdinate management, and resolve regional conflicts. (Daniels-Florida)

LIQUEFIED NATURAL GAS TERMINAL SITING IN THE CALIFORNIA COASTAL ZONE: THE SCOPE OF PERMISSIBLE STATE AUTHORITY,
J. C. Arnold.
Pacific Law Journal, Vol 9, No 2, p 1069-1113, July 1978.

Descriptors: *California, *Natural gas, *Sites, *Shore protection, Liquids, Energy, Facilities, Coasts, Legal aspects, State governments, Environmental effects, Federal government.

With the enactment of the 1977 Liquefied Natural Gas Terminal Act (Act) California has committed itself to the importation by sea of liquefied natural gas as a primary energy source for the foreseeable future. Further siting criteria are necessary to govern construction of additional liquid natural gas facilities in the California coastal zone. Regardless of whether the state or federal government has the power to establish ultimate siting criteria for import terminals, the nature of liquid natural gas and the potentially disastrous impact of a massive accident compel governmental consideration of the siting issue. Onshore as opposed to offshore siting,

and remote as opposed to populated site locations, are topics of current and continued public concern that must eventually be dealt with at the federal or state level. The Act raises the question of whether the state may constitutionally enforce the statute in the face of federal preemption. The present federal statutory scheme indicates an intent that states retain a significant degree of control over liquid natural gas facility siting. (Daniels-Florida)

COASTAL ENERGY IMPACT PROGRAM: REGULATIONS TO ESTABLISH THE OUTER CONTINENTAL SHELF (OCS) STATE PARTICIPATION GRANT PROGRAM (FINAL RULES).
Department of Commerce, Washington, DC.
Federal Register, Vol 45, No 14, p 4306-4311, January 21, 1980.

Descriptors: *Grants, *Continental shelf, *Resources development, *Governmental interrelations, State governments, Oil, Leases, Government finance, Management, Planning, Environment.

These final regulations describe administrative procedures for implementing section 308(c) (2) of the 1972 Coastal Zone Management Act. The Outer Continental Shelf State Participation Grant Program is established which provides financial assistance for coastal state participation in policy, planning, and managerial decisions related to continental shelf oil and gas resources management. The Assistant Administrator is authorized to make grants to coastal states likely to be affected by Outer Continental Shelf energy activity, provided these states are eligible to receive Coastal Energy Impact Program assistance. These grants are intended to pay for state participation in formulating leasing programs, reviewing environmental impact statements, making recommendations for exploration and development, and analyzing program data. Each state receives an equal minimum share. After this, remaining funds are alloted according to a formula. Each state has thirty days to comment upon the formula applied to it. The regulations also set out the proper contents of a grant application. Each state has 120 days to apply for its allotment, or it reverts back to the Assistant Administrator for redistribution. (Tabano-Florida)

FISHERMEN'S CONTINGENCY FUND (FINAL REGULATIONS).
Department of Commerce, Washington, DC.
Federal Register, Vol 45, No 17, p 6062-6078, January 24, 1980.

Descriptors: *Compensation, *Continental shelf, *Damages, *Commercial fishing, Fishing gear, Governments, Assessments, Leases, Easements, Permits.

The regulations establish procedures for administering the Fishermen's Contingency Fund. This Fund compensates fishermen for eligible claims for actual and consequential damages. Lost profits due to damages to, or loss of, fishing vessels or gear by activity associated with oil and gas exploration, development, or production on the Outer Continental Shelf are recoverable. The Fund is set up in the United States Treasury and consists of nine area accounts. Assessments are made against leases, easements, and exploration permits relating to the Outer Continental Shelf in order to fund each area account. Eligibility for compensation requires that the claimant be a commercial fisherman. The procedure for computation of damages is set forth. The regulations also set forth instructions for filing claims. The chief of the Financial Services Dicision and the Secretary of the Interior both take part in processing claims. The burden of demonstrating eligibility for, and the amount of, compensation is upon the claimant. Costs of the proceeding are paid by the person responsible for the damage. The government is subrogated to any other rights the claimant may have against any person in another proceeding. (Tabano-Florida)

RATIONAL DEVELOPMENT OF OUTER CONTINENTAL SHELF OIL AND GAS,
Senate, Washington, DC.
H. M. Jackson.
Oregon Law Review, Vol 54, No 4, p 567-581, 1975.

Descriptors: *Continental shelf, *Resources development, *Oil, *Gases, Exploration, Legislation, Federal government, Environmental effects, State governments, Energy, Programs.

The United States domestic energy production effort should be directed toward increasing the rate of exploration and development on the Outer Continental Shelf (OCS). Obstacles to OCS gas and oil development are technological, economic, environmental, legal and administrative. Policy issues are: (1) development rate and location; (2) environmental safeguards; (3) role of and impact on coastal states; (4) extent of federal government participation; (5) access to industry information; and (6) resource allocation. Congress must update the 1953 Outer Continental Shelf Lands Act to provide authority and guidelines for development activity. The history of the OCS Act and OCS resource development is examined. The OCS contains large amounts of undiscovered oil and gas resources, and demonstrated reserves of almost one billion barrels of oil and one trillion cubic feet of gas. The major provisions of the proposed 1975 Energy Supply Act are discussed. This Act contains needed changes in the law that allow people to retain control over their resources. (Daniels-Florida)

TRENDS IN ENVIRONMENTAL LITIGATION: A SURVEY OF 1976 NEW JERSEY JUDICIAL DECISIONS,
L. Goldshore.
Rutgers Camden Law Journal, Vol 9, No 1, p 21-59, Fall 1977.

Descriptors: *New Jersey, *Shore protection, *Water resources, *Land use, Environmental effects, Coasts, Wetlands, Legislation, Regulation, Public access, Environmental control, Administrative agencies, Judicial decisions.

In 1976, New Jersey courts dealt with a variety of environmental issues: (1) the balancing and integration of environmental goals with other societal needs; (2) cost allocation for attaining governmental objectives; (3) the validity of environmental protection statutes and regulations; and (4) the application of general statutes to specific environmentally-related factual contexts. The Department of Environmental Protection (DEP) wetlands hearing regulations were upheld against attack by a conservation group. The state's supreme court decided that the public trust doctrine prohibited a municipality from discriminating between residents and non-residents. As to water resources issues, the New Jersey courts heard cases dealing with thermal pollution, oil spills, flooding and sewerage authorities. There were several exclusionary zoning cases, in which municipalities argued that environmental considerations prohibited development of low-cost housing. As to outdoor recreational issues, the constitutionality of statutory provisions for selecting members of the Fish and Game Council were upheld. Statutes were interpreted dealing with out-of-state solid waste, the Solid Waste Management Act, and the Solid Waste Utility Control Act. (Wilson-Florida)

GEOTHERMAL LEASING,
R. J. Werner.
Oregon Law Review, Vol 54, No 4, p 623-641, 1975.

Descriptors: *Water resources development, *Leases, *Geothermal studies, *Steam, Legislation, Federal government, Legal aspects, Resources, Public lands, Energy, Water resources.

Geothermal steam has tremendous electrical energy potential. Concentrations of geothermal energy, economically feasible to extract, are in geothermal reservoirs. There are three requirements geothermal reservoirs must meet for economical exploitation. By 1985, ten percent of the United States (U.S.) energy needs could be produced from these reservoirs. Exploration presently is occuring in some western states. Before 1970, no statutory authority permitted the disposition of geothermal resources on public lands, where much geothermal potential exists. The 1970 Geothermal Steam and Associated Geothermal Resources Act (Act) encouraged development through a system of privately held leases. The Act provides guidelines to what lands are subject to leasing. Lease holders are limited to U.S. citizens, associations of citizens, corporations and governmental units. A 'grandfather' clause is included. Certain aspects of the Act's regulatory provisions are discussed: extraction of by-products; minerals excepted from leases; mineral lease conversion; effect on state water laws; surface use; and lease procedures and assignment. Certain lease terms are discussed: duration; leasehold area; rents and royalties; readjustment; and other miscellaneous terms. It is unclear whether minerals reserved to the U.S. in patents previously issued apply to geothermal resources. (Daniels-Florida)

CONTROLLING MARINE POLLUTION - WORLD TASK OR NATIONAL.,
Texas Univ. at Austin.
W. L. Butte.
Stanford Journal of International Studies, Vol 8, p 99-112 Spring 1973.

Descriptors: *Oceans, *Pollution abatement, *International waters, *Law of the sea, United Nations, United States, International law, Legislation, Conferences, Regimes, Negotiations.

An international solution to ocean pollution will create problems of indefinite delay and inconclusive results. The language used in Article 25 of the 1958 Geneva Convention on the High Seas is an example of the problems inherent in looking for an international solution. The 1972 United Nations (U.N.) Conference on the Human Environment in Stockholm attempted to deal with marine pollution. It could not agree on anything specific or concrete. Its Declaration is not binding on any states. The preparatory work undertaken for the 1973 U.N. Conference on the Law of the Sea indicates problem-solving will be attempted by creating new committees and agencies. Direct confrontations will be avoided. Generalized objectives would not be binding. Alternative methods to the U.N. machinery to solve ocean pollution are compared. These include multilateral, bilateral or unilateral action. Developed nations must solve ocean pollution, either alone or through negotiations among the industrialized states. (Daniels-Florida)

U.S. POSITION ON NEGOTIATIONS CONCERNING THE GREAT LAKES,
Department of State, Washington, DC.
D. Burns.
Syracuse Journal of International Law and Commerce, Vol 1, No 2, p 199-204, Fall 1973.

Descriptors: *Great Lakes, *United States, *Canada, *Boundary disputes, International Joint Commission, Negotiations, Boundaries(Surface), Water pollution, Treaties, Water pollution control, Water quality control, Monitoring.

Attempts at resolution of boundary water problems have played a dominant role in United States-Canadian relations over the years. In 1909, the two countries concluded the Boundary Waters Treaty (Treaty). The 1909 Treaty created the International Joint Commission (Commission), which has the principle function of passing on applications to use, divert, or obstruct waters covered by the Treaty. Article IV of the Treaty provides that the waters covered therein shall not be polluted by either side. Shortly after its establishment, the Commission was requested to look into questions of water pollution. The Commission has made recommendations to both governments with respect to various questions of boundary waters pollution. Both par-

ties have agreed that the Commission should monitor water pollution. The Commission's 1970 report is the basis on which the Great Lakes Duality Agreement has been negotiated. The principle recommendations of the Commission are: (1) adoption of common water quality objectives; and (2) continued Commission monitoring. (Daniels-Florida)
W80-05390

COMPARATIVE NATIONAL LEGISLATION ON OFFSHORE POLLUTION,
United Nations Secretariat. Office of Legal Affairs.
M. Hayashi.
Syracuse Journal of International Law and Commerce, Vol 1, No 2, p 250-256, Fall 1973.

Descriptors: *Foreign countries, *Oil pollution, *Continental shelf, Water pollution, Environmental control, Legal aspects, International commissions, Water pollution control, International law, Oil spills.

National legislation on marine pollution can be classified into four types: (1) provisions concerning the development of continental shelf resources; (2) laws enacted pursuant to the 1954 London Convention for the Prevention of Pollution of the Sea by Oil (London Convention); (3) those containing the elements covered by the London Convention and the 1969 Brussels Convention on oil pollution casualties; and (4) laws which do not fall into the above three categories. In the first category, most of the provisions are based on the Geneva Convention on the Continental Shelf. This states that continental shelf exploration must not result in unjustifiable interference with navigation, fishing or conservation. Nations with this type of legislation include Italy, Sweden, Venezuela, and the United States. The United States also has legislation that compacts with the London Convention. Similar laws are in effect in France, Ghana, Kuwait, and Spain. The third category consists of more comprehensive laws, such as the British Oil in Navigable Waters Act of 1971. Lastly, some national laws have unique features not present in the other categories. An example is the Australian Navigation Act. (Wilson-Florida)
W80-05391

THE RIGHTS AND LIABILITIES OF A MINERAL OWNER CONCERNING THE USE OF WATER,
K. C. Raney, Jr.
South Texas Law Journal, Vol 17, No 3, p 510-524, 1976.

Descriptors: *Texas, *Mineral industry, *Water rights, *Water allocation(Policy), Water demand, Judicial decisions, Mining, Subsurface waters, Surface waters, Mine water, Water law.

The increased mining of hard minerals in Texas has created great conflict between the rights of mineral owners and other water users involving the same supply of water. The use of water by mineral producers has created some novel situations that past legislatures and courts could not have anticipated. A mineral owner's right to use water can be determined by classifying water into two categories, either subterranean water or non-subterranean water. Subterranean water is either an underground stream or percolating water. This distinction is important with respect to claims of water ownership. With percolating water, the problem is one of determining rights between users. As a general rule, a surface owner has the right to use the surface water on his property. The issue remains whether a mineral lessee has the right to use or drain surface water as a reasonable use of the surface estate in mining his claim. The right to mine and the right to use water must be reconciled where conflicting to provide an effective water policy. (Wilson-Florida)
W80-05392

JUDICIAL DEFERENCE IN THE SUBMERGED LANDS CASES,
Vanderbilt Univ., Nashville, TN.
J. I. Charney.
Vanderbilt Journal of Transnational Law, Vol 7, No 2, p 383-455, Spring 1974.

Descriptors: *Judicial decisions, *Beds under water, *Legal aspects, Constitutional law, Constraints, Adoption of practices, Adjudication procedure, Legal review, Jurisdiction, Water law.

In many areas of foreign relations, the United States (U.S.) Supreme Court has determined the judiciary should exercise restraint and defer to the wishes of the Executive Branch. This judicial restraint and deference may be appropriate in submerged lands cases. The Supreme Court has failed to identify factors that require judicial restraint. The primary subject matter areas in which judicial restraint has been exercised are recognition, sovereign immunity, state acts, treaty interpretation and territorial questions. Twelve significant court decisions in the submerged lands dispute are reviewed. Initially, the Supreme Court exercised restraint in submerged lands disputes, believing their decisions might affect the U.S. territorial boundary. This restraint became tempered; most recent decisions minimize deference to the Executive branch. A review of the submerged lands issues indicates deference should play no role in submerged lands cases. (Daniels-Florida)

INTERNATIONAL STRAITS, GLOBAL COMMUNICATIONS, AND THE EVOLVING LAW OF THE SEA,
W. G. Grandison, and V. J. Meyer.
Vanderbilt Journal of Transnational Law, Vol 8, No 2, p 393-449, Spring 1975.

Descriptors: *Law of the Sea, *Communication, *Straits, International law, International waters, Navigation, Legal aspects, Oceans, Jurisdiction, Regimes.

Extending territorial seas to twelve miles will cause over 100 straits to be overlapped by the territorial sea. Existing international legal norms preserving navigational freedom and overflight between ocean areas will be altered. Controversy ensues over what legal regime should govern the traffic in these straits. Communications issues raised by the proposed extention are focused on. A legal regime is suggested to resolve current legal controversies, and to provide continuity in the law governing international communications within these straits. The evolving law of the sea and the events leading to the straits controversy are examined. The role of straits in ocean communications, the interests of states relying on the use of straits for communications and the interest of coastal states bordering straits are explored. There are general legal trends supporting global communications. Different legal approaches to the control and regulation of communication and to the allocation of authority to control communication in straits are examined. A new straits regime must guarantee to all nations use of and access to communications media in straits. (Daniels-Florida)

CANADA'S INTERESTS AS REGARDS PROTECTION AND REGULATION OF THE GREAT LAKES,
Department of External Affairs, Ottawa (Ontario). Bureau of Economic and Scientific Affairs.
K. Wardroper.
Syracuse Journal of International Law and Commerce, Vol 1, No 2, p 205-222, Fall 1973.

Descriptors: *Canada, *Great Lakes, *Water pollution control, *United States, International Joint Commission, Water pollution, Boundaries(Surfaces), United States, Negotiations, Treaties, Environmental control.

In 1964 the Boundary Waters Treaty launched the International Joint Commission into an intensive examination of the water conditions in the lower Great Lakes. In 1970 the Commission reported there was extensive tran-boundary pollution in the area. This report also proposed five general objectives to which both the United States and Canada should address themselves. These objectives state that the waters of the Great Lakes should be: (1) free from substances or solids attributable to municipal discharges; (2) free from floating debris and other discharges in unsightly or deleterious amounts; (3) free from odor-producing material attributable to municipal discharges; (4) free from nutrients; and (5) free from hazardous and toxic substances. These general objectives, in order to be translated into meaningful intergovernmental undertakings, have been presented as numerous specific objections. Under a proposed agreement, the governments concerned would exchange commitments to carry out a variety of pollution control programs. These programs include: (1) construction of treatment facilities; (2) reduction of phosphorus discharges; (3) elimination of mercury from discharges; and (4) control of pesticide pollution. (Wilson-Florida)
W80-05395

ENVIRONMENTAL LAW - A SURVEY OF INTERNATIONAL MARINE POLLUTION CONTROL: PRELUDE TO GENEVA,
P. B. Barr, Jr.
Vanderbilt Journal of Transnational Law, Vol 8, No 2, p 477-492, Spring 1975.

Descriptors: *Water pollution control, *International commissions, *Law of the sea, *United Nations, International law, Treaties, Environmental control, International waters, Water pollution, Foreign countries, Oceans.

Treaties, conventions, and agreements relative to marine pollution are myriad. Summaries of modern international efforts to prevent pollution begin with the 1954 Convention for the Prevention of Pollution of the Sea by Oil. Several United Nations Conventions drafted at the First Law of the Sea Conference, now in force, incorporate provisions designed to protect the marine environment. Nations that share marine resources because of geographical proximity have begun to recognize common pollution problems. An example of such a regional agreement is the Committee on the Challenges of a Modern Society established the North Atlantic Treaty Organization in 1969. Marine pollution has recently become an area of cooperation between the United States and the Soviet Union. A 1972 agreement anticipates joint study and development of coordinated projects in basic and applied sciences. Non-governmental bodies, such as the International Council of Scientific Unions, have also become involved in prevention of marine pollution. Recent United Nations approaches include the 1972 Stockholm Conference on the Human Environment and the 1974 Conference on the Law of the Sea. (Wilson-Florida)

NATIONAL WATER POLICY IN THE WAKE OF UNITED STATES V. NEW MEXICO,
New Mexico Water Resources, Santa Fe.
R. A. Simms.
Natural Resources Journal, Vol 20, No 1, p 1-16, January 1980.

Descriptors: *Federal reservations, *Federal-state water rights conflicts, *Reservation doctrine, *Water allocation(Policy), Judicial decisions, Water policy, Water rights, Federal government, Legal aspects, Water users, State governments.

In a 1978 decision, the United States (U.S.) Supreme Court limited federal reserved right claims to the Rio Mimbres drainage of the Gila National Forest. They were limited to an amount of water necessary to satisfy the purposes for which the forest lands were withdrawn from the public domain. The federal government has reacted by reassessing its posture in water rights litigation in various western states, and by creating a conceptually new basis upon which to assert its claims. The U.S. Solicitor General has asserted that the U.S. has always retained a residual right to use nonnavigable western waters for congressionally mandated purposes, independently of the reservation doctrine. This doctrine of 'non-reserved federal water rights' attempts to circumvent rather than adhere to the Court's decision. Moreover, President Carter has made assurances that his water policy reforms will not undermine state preroga-

tives in water rights administration. When acting on the President's water policy recommendations, Congress should not ignore the views of western water officials. (Wilson-Florida)

ABORIGINAL WATER RIGHTS,
Yegge, Hall and Evans, Denver, CO.
J. L. Merrill.
Natural Resources Journal, Vol 20, No 1, p 45-70, January 1980.

Descriptors: *Water rights, *Federal reservations, *Indian reservations, Federal government, State governments, Water demand, Water users, Legal aspects, Prior appropriation, Federal-state water rights conflicts.

An aboriginal water rights, one which was the first of its kind in a region, is based on the water use from earliest days. A water right which predates federal sovereignty is sufficient to render that right aboriginal vis-a-vis the United States. Aboriginal rights constitute a potentially great threat to present water users because they may displace federal water rights and those held under state prior appropriation law. Aboriginal water rights have greatest potential impact in the western states. Aboriginal rights were judicially decreed in a 1935 case and exist as pueblo water rights in California and New Mexico. Little else has been heard about them until recently. Native American Indian tribes have begun to claim they have always held and now hold aboriginal water rights. Several aspects of aboriginal water rights deserve exploration: (1) their relationship to the federal Winters Doctrine; (2) state court jurisdiction over aboriginal rights; (3) groundwater; and (4) the uses to which these waters might be put. (Wilson-Florida)

CONSIDERATIONS AND CONCLUSIONS CONCERNING THE TRANSFERABILITY OF INDIAN WATER RIGHTS,
J. D. Palma.
Natural Resources Journal, Vol 20, No 1, p 91-100, January 1980.

Descriptors: *Water rights, *Federal reservations, *Water transfers, *Indian reservations, Federal government, Federal-state water rights conflicts, Judicial decisions, Water allocation(Policy), Prior appropriation, Legal aspects, Water demand, Water users.

As a consequence of the United States (U.S.) Supreme Court decision in Colorado River Water Conservation District v. U.S., there has been intensified adjudication of Winters Doctrine water rights between the states and the U.S. and/or their Indian wards. Courts have applied various standards to determine the water quantity reserved under the Winters Doctrine. Regardless of what test is utilized to quantify these Indian water rights, the tribes will obtain prior and, in most cases, paramount rights to vast water quantities. An important issue is the transferability of Indian water rights to new uses within the Indian reservation boundaries. Since most of the water claimed under the Winters Doctrine has not yet been put to beneficial use, there is a question about the water quantity transferable to a new use. An additional issue concerning the transferability of Winters rights involves the rights of purchasers of land formerly a part of the reservation. (Wilson-Florida)

RES JUDICATA - WILL IT STOP INSTREAM FLOWS FROM BEING THE WAVE OF THE FUTURE.,
Department of the Interior, Albuquerque, NM. Field Solicitor's Office.
H. A. Ranquist.
Natural Resources Journal, Vol 20, No 1, p 121-151, January 1980.

Descriptors: *Prior appropriation, *Streamflow, *Water rights, Indian reservations, State governments, Streams, Judicial decisions, Water distribution(Applied), Legal aspects, Diversion.

The instream flows issue is arising in water rights litigation in the west. Until recently the western states have denied that instreams had any place in the appropriation system. As the move to establish instream flows increases, present water users are rising in opposition. A barrier which opponents of instream flows will erect is the claim that western streams are fully appropriated and adjudicated, leaving little or no room for the exercise of instream flows. They argue that the legal bar to further litigation under the doctrines of res judicata and collateral estoppel will shield against instream water claims. However, the unique nature of water and the water adjudication process, particularly quit title proceedings, results in many water uses not being subject to bars against further litigation. If diversion from streams is restricted to effective beneficial use, water will be available to establish instream flows in some streams despite the applicability of the bar to further action. 6G. Ecologic Impact Of Water Development

WATER AND THE ENVIRONMENT -- A SCOTTISH SOLUTION,
Cutherbertson (Rober H.) and Partners, Edinburgh (Scotland).
W. P. McLeish, and D. Mackie.
Water, No 31, p 11-14, March 1980. 5 Fig, 3 Ref.

Descriptors: *Environmental effects, *Scotland, *Water supply development, Water supply, Reservoirs, Water demand, Project benefits, Land use, Water sources, Aqueducts, Ecology, Impact studies, Evaluation, Analytical techniques, Classification.

The findings and methods used in a comparative environmental examination of the three preferred schemes for the treating of water from new sources and conveying it to selected distribution points in Scotland are discussed. The three schemes are: the Clyde scheme, based on a large regulating reservoir on an upper tributary; the fourth scheme based on two regulating reservoirs; and the Tay scheme based on direct abstraction from the river. The study was designed to gather information on the characteristics of the areas involved, the activities in those areas, the impacts of the proposals on these characteristics and activities, and the capability of the proposals for modification to elimanate environmental problems. The information gathered from various agencies was combined to form an 'impact matrix' for each subarea involved. Impacts were classified as long term benefit, short term benefit, no benefit or disbenefit, short term disbenefit, or long term irreversible disbenefit. Results show that in environmental terms, the Tay scheme is the most desirable plan due to the fact that it will not produce long-term deleterious irreversible effects. Results also show that the Clyde scheme would have the most damaging environmental effects. (Seigler-IPA)

ASSESSMENT OF EFFECTS OF ALTERED STREAM FLOW CHARACTERISTICS ON FISH AND WILDLIFE, PART A: ROCKY MOUNTAINS AND PACIFIC NORTHWEST, EXECUTIVE SUMMARY,
Enviro Control, Inc., Rockville, MD.
W. Nelson, G. Horak, M. Lewis, and J. Colt.
U.S. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS/-76/28. December, 1976. 14 p.

Descriptors: *Rocky Mountain region, *Pacific Northwest U.S., *Wildlife habitat, *Water resources development, Streamflow, Wildlife, Dams, Alteration of flow, Fisheries, Water resources, *Altered streamsflow, Environmental effects, Ecology.

A detailed summary, evaluation, and a series of recommendations is provided on the impacts of 109 instream flows distributed in nine western states. The introductory discussion explains the background, purpose, and methodology of the research. The more significant conclusions are summarized in the next section. These conclusions are utilized in the final section as the basis for key recommendations for improving the process of instream flow reservation and implementation. (Steiner-Mass)

ASSESSMENT OF EFFECTS OF ALTERED STREAM FLOW CHARACTERISTICS ON FISH AND WILDLIFE. PART B: CALIFORNIA, EXECUTIVE SUMMARY,
Jones and Stokes Associates, Inc., Sacramento, CA.
C. Hazel.
U.S. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-76/32. December, 1976. 14 p.

Descriptors: *California, *Wildlife habitat, *Water resources development, *Stream flow, Wildlife, Dams, Alteration of fflow, Fisheries, Water resources, Fish management, *Altered streamflow, Environmental effects, Ecology.

Forty-six projects were investigated and evaluated to identify the discernible effects of post-project flows on pre-project fish and wildlife and to evaluate the success and effectiveness of various methodologies used to predict project effects. Each project was reviewed and evaluated through a literature search, review of files, interviews with project biologists, and visits to the project site. Conclusions were: The methodology for obtaining instream flows for fish and wilflife in California are insufficiently documented and publicized. Information about the quantity of water potentially available for fish and wilflife was usually not made available to the fisheries agencies. Average monthly post-project flows of about 0.7 or less of the pre-project flow during critical periods are degrading to fisheries and decreases to 0.3 or less severly damage or lead to the extinction of the principal fisheries. Projects that divert water from the reservoir pool are most damaging to fish. On the other hand, projects that utilize the river channel to convey project water to users are most likely to maintain or improve the pre-project fishery. (Steiner-Mass)

7. RESOURCES DATA

7B. Data Acquisition

AN INVESTIGATION OF SATELLITE-RADAR CORRELATION FUNCTIONS,
Eddy (Amos) Inc., Norman, OK.
L. A. Hembree.
Available from the National Technical Information Service, Springfiled, VA 22151 as PB80-176001, Price codes: A11 in paper copy, A01 in microfiche.

Descriptors: *Radar, *Remote sensing, *Satellites(Artificial), *Rainfall, Montana, Model studies, Mathematical models, Storm structure, Meteorology, Methodology, Analysis, Infrared radiation, Rain gages, Weather data, Precipitation(Atmospheric), Weather patterns.

Space time correlation fields were used to combine radar and satellite data sets to improve estimates of surface precipitation. Data used in the study included rain gage, radar, and satellite observation derived from the HIPLEX (High Plains Cooperative Program) project at Miles City, Montana. The radar data consisted of digitized 5 cm radar returns from 5 minute scans of 12 elevation angles, however, only the 1 degree angle was used. Satellite data consisted of visible reflectance and IR radiance. Temperature gradients were calculated since the highest temperature gradient should be associated with higher rain rates. Four convective complexes were analyzed in detail using a multivariate optimal interpolation objective method of analysis. The correlation fields were used to represent the storm structures as implied by observed data. A four-dimensional Gaussian damped cosine function with parameters reflecting storm characteristics was used to model the correlation fields. Results show that suitable correlation fields can be obtained with respect to auto-correlation fields. For cross-correllation fields, which tend to be multimodal, a more general correlation model may be needed. Correlation values of 0.6 between satellite and radar rain data were reached at the appropriate space-time lags for maximizing pattern correspondence. The potential value of the multivariate objective analysis methodology is established. (Seigler-IPA)

USERS GUIDE FOR THE ANALYSIS AND INTERPRETATION OF SATELLITE IMAGERY ON THE HIGH PLAINS SUMMER CLOUD AND MESOSCALE SYSTEMS,
Water and Power Resources Service, Denver, CO. Div. of Research.
D. A. Matthews.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-175987, Price codes: A03 in paper copy, A01 in microfiche. Report, January 1980. 44 p, 17 Fig, 2 Tab, 17 Ref.

Descriptors: *Remote sensing, *Satellites(Artificial), *Cloud physics, *Precipitation(Atmospheric), Meteorological data , Weather data, Synoptic analysis, Weather modification, Cloud seeding, Storms, Montana, Texas, Kansas, Atmospheric physics, Air temperature, Air circulation.

Examples of typical cloud types and mesocale organized cloud systems which affect summertime precipitation on the High Plains are illustrated and discussed to aid in the interpretation of satellite imagery and to provide a guide for uniform classification. The examples are taken from conditions over the High Plains at the Water and Power Resources Service HIPLEX (High Plains Cooperative Program) field sites in Montana, Kansas, and Texas. Nine types of mesoscale organization visible in geosynchronous satellite imagery are illustrated: mountain orographic cumulus, convergence lines (lines of convective clouds), vorticity sheet (line of intense lateral shear), cloud street of cumulus, jetstream, cirrus bands, mesohigh associated with thunderstorms, cloud clusters, differential heating due to low stratus and fog, and upslope stratiform conditions. The cloud categories used are: clear, small cumulus (very small, wide spread, haze like), small cumulus (distinct cells), cumulus congestus, cumulonimbus, stratocumulus, stratus, altocumulus, altocumulus castellatus, and cirrus. Methods used to identify these categories are described to aid user interpretation of information available on visible satellite imagery. Three examples of synoptic characteristics inferred by cloud patterns are also illustrated and discussed. (Seigler-IPA)

BED LOAD: DEFINITION AND MEASUREMENT,
Cornell Univ., Ithaca, NY. Dept. of Environmental Engineering.
P. J. Murphy, and M. I. Amin.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 759-766, 1978. 7 Fig, 3 Ref. NSF ENG76-17263.

Descriptors: *Bed load, *Model studies, *Bed load samplers, Sediments, Movement, Particle size, Hydraulic models, Sampling, Bottom sampling, Sediment transport, On-site tests, Analytical techniques, Analysis.

The purpose of this paper was twofold: (1) to explain the difference between bed load and suspended load, and (2) to report the development of a compartmented pit sampler. A particle is defined to be in a turbulent suspension during the time it is carried beyond the bounce limit by the supportive turbulent velocity fluctuations. The rest of the time it moves as bed load. A depiction of this definition was given schematically. The compartmented trap is composed of a watertight box, its sliding cover, and a large number of removable compartments. During a test the compartments are filled with the sediment that moves along the bottom of the streambed. Since the compartments in the downstream end of the trap can catch only those particles that have jumped over the containers in the upstream end of the trap, the downstream compartments catch a smaller mass of moving sediment than do the upstream ones. This variation in the deposition of the sediment permited the calculation of the fraction of the total sediment sample with a particular jump length. (See also W80-05159) (Humphreys-ISWS)

SMOOTHED DATA AND GRADIENTS USING SLIDING POLYNOMIALS WITH OPTIONAL CONTROLS,
Science and Education Administration, Athens, GA. Southeast Watershed Research Program.
W. M. Snyder.
Water Resources Bulletin, Vol 16, No 1, p 22-30, February 1980. 10 Fig, 4 Tab, 11 Ref.

Descriptors: *Data processing, *Analytical techniques, *Analysis, Computer programs, Regression analysis, Climatic data, Weather data, Hydrologic data, Sliding polynomials, Smoothed data, Data smoothing.

Sliding polynomials differ from other piecewise interpolation and smoothing methods in their functional continuity at the nodes. This functional continuity was used to establish optional spacing of nodes and optional boundary controls in data smoothing while still maintaining mathematically continuous rates or gradients. Cyclic as well as noncyclic data can be smoothed. Variance of the individual nodal values, derived through least-squares optimization, can be calculated using the rigorously determined weighting coefficients between data points and nodes. Such nodal variances are estimates of localized uncertainty in the data which complement the localization of smoothing through use of piecewise functions. Choice of controls in smoothing and calculation of variance were incorporated in a computer program for user convenience. (Sims-ISWS)
W80-05140

THE EFFECT OF DATA INDEPENDENCE IN MODEL CALIBRATION AND MODEL TESTING,
Maryland Univ., College Park. Dept. of Civil Engineering.
M. L. Shrader, R. H. McCuen, and W. J. Rawls.
Water Resources Bulletin, Vol 16, No 1, p 49-55, February 1980. 13 Tab, 6 Ref.

Descriptors: *Model studies, *Mathematical models, *Calibrations, *Hydrology, Rainfall, Runoff, Rainfall-runoff relationships, Hydrographs, Unit hydrogrphas, Regression analysis, Analytical techniques, Hydrologic data, Peak discharge, Data processing, Equations.

With the increased use of models in hydrologic design, there is an immediate need for a comprehensive comparison of hydrologic models, especially those intended for use at ungaged locations (i.e., where measured data are either not available or inadequate for model calibration). But some past comparisons of hydrologic models have used the same data base for both calibration and testing of the different models or implied that the results of model calibration are indicative of the accuracy at ungaged locations. This practice was examined using both the regression equation approach to peak discharge estimation and a unit hydrograph model that was intended for use in urban areas. The results suggested that the lack of data independence in the calibration and testing of regression equations may lead to both biased results and misleading statements about prediction accuracy. Additionally, although split-sample testing is recognized as desirable, the split-samples should be selected using a systematic-random samplin scheme, father than random sampling, because random sampling with small samples may lead to a testing sample that is not representative of the population. A systematic-random sampling technique should lead to more valid conclusions about model reliability. For models like a unit hydrograph model, which are more complex and for which calibration is a more involved process, data independence is not as critical because the data fitting error variation is not as dominant as the error variation due to the calibration process and the inability of the model structure to conform with data variability. A GRAPHICAL COMPUTATION SYSTEM FOR THREE-DIMENSIONAL LAKE CIRCULATION AND CONTAMINANT DISPERSION,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
J. A. Liggett, R. H. Gallagher, J. Salmon, and G. Blandford.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 529-540, 1978. 6 Fig, 5 Ref, 1 Append. NSF ENG76-05029.

Descriptors: *Lakes, *Water circulation, *Path of pollutants, *Computer programs, Graphical meth-

ods, Equipment, Computers, Data processing, Mathematical models, Model studies, Finite element analysis, Analytical techniques, *Computer graphics, Graphical output, Display systems, Graphical input, Graphical computation.

As computer programs become larger, the major expense of calculation is often not the computer time but is the data preparation and interpretation of the output. A major liability of computer usage is the precise manner in which data must be supplied (cards or magnetic tape which generally are punched by hand in the first instance). The results usually appear as printed numbers, although computer-driven plotters have become common. Computer graphics alleviates these shortcomings by allowing the user to communicate with the computer--in both the input and output phases--in a quasi-analogue, operator-oriented fashion which seems more natural to the user. The computer itself takes on the primary function of data preparation, and it presents the results in a manner that can be interpreted easily and quickly. This paper described a graphics system which acts as a pre- and post-processor for the computation of three-dimensional circulation in homogeneous lakes. The convection and diffusion of a contaminant were included, which can lead immediately to an elementary pollution analysis. The full graphics capability was presented on a video tape which leads the viewer through the input, analysis, and results of an example. A description of the graphics system hardware was presented in the appendix. (See also W80-05159) (Sims-ISWS)

CURRENT COMPUTER PRACTICES WITHIN CIVIL ENGINEERING,
Maryland Univ., College Park. Dept. of Civil Engineering.
D. R. Schelling.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 791-799, 1978. 3 Fig, 1 Tab, 14 Ref.

Descriptors: *Computers, *Civil engineering, *Computer programs, Programming languages, Management, Soils, Hydraulics, Bridges, Documentation, Reviews, Structures, Computer practices, Computer uses, Software.

The current status of computer utilization within the civil engineering field was examined. Specific information pertaining to existing engineering computer programs, program sources and needs, computer hardware, language, documentation standards and practices were presented in condensed tabular form. The use of the computer within the practice of civil engineering is widespread and extremely diverse. The proliferation of computer programs and the associated duplication of effort is at least partially due to the incompatibilities between computer systems and the multilanguage environment. Coupled with this, the lack of adequate documentation on existing software effectively negates the usefulness of many existing programs. (See also W80-05159) (Humphreys-ISWS)

MAPPING MODEL FOR DETERMINING LAND SUITABLE FOR IRRIGATION,
Nebraska Univ., Lincoln. Dept. of Industrial and Management Systems Engineering.
R. O. Hoffman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-188683, Price codes: A02 in paper copy, A01 in microfiche. Nebraska Water Resources Center, University of Nebraska Final Report, April 28, 1980. 23 p, 3 Fig, 2 Tab, 7 Ref. OWRT A-039-NEB(1).

Descriptors: *Mapping, *Irrigable land, *Land classification, *Computer models, *Nebraska, Land use, Maps, Remote sensing, Soil types, Data processing, Aerial photography, Administration, Mathematical models, Algorithms.

CMS II, a computer composite mapping system, was adapted for use on the IBM 360, Model 198 computer system at the University of Nebraska for use in developing a Nebraska map showing land that is suitable for the development of irrigation systems. The CMS-II program is written in COBOL and the memory core requires 256 K bytes. CMS-II can be used to collate many forms of maps, taped data, and tabular data; grid size can be set as fine as the basic data will allow. The CMS-II program was tested using data from Dundy County located on the western edge of Nebraska. A land use mapping process was used based on viewing each piece of land on two separate color IR aerial photos, one taken in early summer and the other in late summer. Separate computer plots were produced for each of 27 types of land use. The program was also used to develop a mathematical model that predicts the number of acres that will be developed in future years for each soil series. Advantages of the CMS system are its ability to handle both quantitative and qualitative data and its inclusion of a factor weighing algorithm. CMS-II was found to be easy to use with high potential as a tool for analyzing the effects of water allocation and management. (Seigler-IPA)

WATER RESOURCES DATA FOR WEST VIRGINIA, WATER YEAR 1978.
Geological Survey, Charleston, WV. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153307, Price Codes: Microfiche only, MF/A01. Geological Survey Water-Data Report WV-78-1, November 1979. 357 p, 4 Fig.

Descriptors: *West Virginia, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1978 water year for West Virginia consist of records of stage, discharge, and water quality of streams and springs; stage and contents of lakes and reservoirs; and water levels in wells. This report contains discharge records for 118 gaging stations, stage only records for 3 gaging stations, stage and contents for 7 lakes and reservoirs, contents for 1 reservoir, change in contents for 1 reservoir, water quality for 47 gaging stations, and water levels for 31 observation wells. Also included are 3 crest-stage partial-record stations, and 4 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements and analyses. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in West Virginia. (Kosco-USGS)

AN EXPERIMENTAL INVESTIGATION OF UPLIFT PRESSURES,
Bechtel Incorp., San Francisco, CA.
A. Prakash, C. Arumugam, and A. Jagadheesan.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 396-406, 1978. 4 Fig, 1 Tab, 6 Ref, 1 Append.

Descriptors: *Hydraulic structures, *Dams, *Uplift pressure, *Model studies, Laboratory tests, Analog models, Groundwater, Groundwater movement, Pressure, Filters, Soil filters, Wells, Structures.

Impervious floors of hydraulic structures founded on pervious soils are subjected to uplift pressures caused by the seepage of water beneath the structure floor from the upstream to the downstream side. Groundwater movement under the foundations of structures with large width-to-lenght ratios is often treated as two-dimensional. But, for structures with smaller width-to-length ratios, groundwater movement in the lateral direction from or to the underside of the structure to or from the ambient water table significantly affects the distribution of uplift pressure, and the resulting flow pattern is three-dimensional. To simulate three-dimensional seepage below hydraulic structures, an electrical analog was developed, calibrated, and verified with field-measured values. The analog was used to predict three-dimensional seepage pressures on the floors of structures with (1) end and side sheet piles, and (2) intermediate filters and relief wells. It was assumed that groundwater movement was within the Darcy range; Dupuit-Forchheimer approximations held, and steady state conditions prevailed. (See also W80-05159) (Sims-ISWS)

SURFACE FLOW IN A TWO-BAY WATER DIVERSION,
Los Angeles County Flood Control District, CA.
T. L. Tanner, and Y. C. Kim.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 407-414, 1978. 4 Fig, 4 Ref.

Descriptors: *Diversion structures, *Flow, *Canals, *Model studies, Mathematical models, Hydraulic models, Intakes structures, Diversion dams, Clogging, Diversion, Hydraulics.

Surface flow patterns in a water diversion structure were synthesized by a hydraulic model and a mathematical model. The flow patterns for a steady state flow were evaluated to determine the influence of three operational schemes on an intake clogging problem caused by floating debris. The hydraulic model was a distorted scale model of the diversion structure. The mathematical model was a three-dimensional application of a finite difference relaxation method. The models indicated that by operating the diversion structure with the water-inflated dam nearest the diversion canal lower than the other dam, the problem would be minimized. ROMAN WELLS,
Hilleary and Associates, Catonsville, MD.
J. Hilleary.
Water Well Journal, Vol 34, No 5, p 71-72, May, 1980. 1 Fig.

Descriptors: *Water wells, *Dug wells, *Shallow wells, Construction, Well casing, Water pollution, Ground water, England, History.

Hand-dug wells in England were constructed by Roman laborers in shallow, unconsolidated aquifers. A 3x3 foot square of oak planks functioned as supports and frames for side panels. Water seeped in through the sides and bottom of the well. Upon completion of the well, the pit was backfilled and a housing built over it. Water was lifted by means of a rope attached to a wooden bucket. When the wells were abandoned, they became trash collectors and contaminated newer wells dug nearby. Another style of Roman well construction was the stone and wooden well in which the stone was inserted on the bottom half of the well and oak planking installed on the upper half. Barrel casings were sometimes used as long as the barrel staves did not collapse and the well depth was less than 4 feet. Although many barrel-cased wells have been clogged for centuries the oak staves are in remarkable condition. A willow basket casing made of twigs of willow woven into a strong and coherent fabric was also used for shallow wells. (Purdin-NWWA)

MINIMUM REYNOLDS NUMBERS FOR PHYSICAL MODEL SIMILARITY,
Washington State Univ., Pullman. Dept. of Civil and Environmental Engineering.
A. F. Babb, J. Amorocho, and C. Lomax.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 61-69, 1978. 6 Fig, 4 Ref.

Descriptors: *Hydraulic similitude, *Hydraulic structures, *Reynolds number, *Hydraulic models, Model studies, Flow characteristics, Open channel flow, Surge tanks, Orifices, Siphons, Outlet works, Flow system, Free surfaces, Froude numbers, Energy loss, Gates, Conveyance structures.

This paper discussed several model investigations where minimum Reynolds numbers have been identified. The geometries tested were varied and involved flow systems of both the free surface and closed types. Included are studies of open channel warped transitions for the California Aqueduct, surge tank orifices for the Helms Pumped Storage Project in California, and siphon outlet structures also designed for use with pumping plants in the California Aqueduct. Results of tests presented give minimum Reynolds numbers for physical model similarity for some shapes not generally available in the literature. The tested shapes consisted of a warped open channel transition, a surge tank orifice, and a pump discharge line siphon outlet structure. In general, the model scales selected for the studies were large enough to permit model tests to be conducted at Reynolds numbers exceeding the minimum value for acceptable model-prototype similarity. The study on the warped transitions illustrated the importance of simulating approach conditions in the determination of energy loss coefficients. (See also W80-05159) (Humphreys-ISWS)

PHYSICAL MODEL STUDY FOR IMPROVED NAVIGATION CHANNEL DESIGN,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Hydraulics Lab.
H. O. Turner, Jr.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 265-272, 1978. 6 Fig, 5 Ref, 1 Append.

Descriptors: *Navigation, *Channels, *Ships, *Model studies, Hydraulic models, Laboratory tests, Design, Reynolds number, Waves(Water), Canals, Navigable waters, Analytical techniques, Research facilities, Hydraulic similitude, Navigation channels.

The U.S. Army Engineer Waterways Experiment Station is currently conducting a study to determine the minimum dimensions of deep-draft navigation channels. These minimum dimensions will include the various safety aspects so as to provide for safe and efficient navigation. This research study is being conducted with free running remote-controlled scale models of prototype ships. The objective of the model study is focused on the improvement of navigation channel design methods and not necessarily a study of ship maneuverability improvements. The model ships will be used as a means of evaluating the channels being tested. (See also W80-05159) (Sims-ISWS)

MATHEMATICAL MODELS FOR NAVIGATION CHANNEL DESIGN,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
C. J. Huval.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 273-279, 1978. 4 Fig, 11 Ref.

Descriptors: *Navigation, *Channels, *Ships, *Model studies, Mathematical models, Canals, Navigable waters, Design, Analytical techniques, Simulation analysis, Navigation channels.

The U.S. Army Engineer Waterways Experiment Station has recently undertaken an investigation to determine the minimum dimensions of deep-draft navigation channels compatible with the assurance of safe operating conditions. The study will provide the necessary information to improve existing channel design criteria. The research effort was initially designed to employ only a physical scale model with several types of free-running model ships navigating a variety of possible channel configurations. However, during the early phases of the project, it was thought desirable to undertake a review of potentially useful mathematical models and ship simulators. This paper summarized the study of the applicability of ship simulators, physical models, and mathematical model techniques for use in the study of navigation channel improvements and design. Neither of the three analysis methods alone can provide all the required information to design a navigation channel. Each of the three research techniques has unique capabilities and deficiencies. The three research methodologies should be used jointly in a complementary fashion. (See also W80-05159) (Sims-ISWS)

RADIAL SOURCE-SINK FLOW IN STRATIFIED OCEAN,
Cornell Univ., Ithaca, NY. Dept. of Environmental Engineering.
G. H. Jirka, and R. P. Johnson.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 311-316, 1978. 4 Fig, 4 Ref.

Descriptors: *Flow, *Water circulation, *Model studies, Mathematical models, Energy, Oceans, Stratification, Density stratification, Thermal stratification, Hydraulics, Ocean thermal energy conversion.

Ocean thermal energy conversion (OTEC) is a method of generating power using the vertical temperature gradient of the tropical ocean as an energy source. The upper layer of the ocean collects heat energy by absorbing solar radiation. The underlying water is colder due to the return flow from polar regions which occurs within the global circulation of the world ocean. Thus a temperature-stratified system is formed. The vertical salinity distribution is usually locality dependent. However, its effect on density is generally much weaker than that of temperature. In total, a stable density

stratified system is formed consisting of a thin upper layer (in the order of 100 m (300 ft)) and a deep lower layer separated by a thermocline-pycnocline with strong gradients of temperature and density. Various OTEC design options and associated problems of research and development have been described elsewhere. One of the critical problems from a hydrodynamic standpoint is the potential for recirculation. Recirculation is defined as the repeated intake of diluted water which has passed through the evaporator or condenser. Recirculation would have detrimental effects on plant efficiency due to a further reduction of the available temperature difference and possible adverse environmental impact due to the local accumulation of chemicals used in plant operation. This paper presented a schematic approach to the problem which is believed to yield realistic first-order estimates of the recirculation potential for purposes of plant design evaluation. The analytical approach was verified with laboratory experimental data. (See also W80-05159) (Sims-ISWS)

VORTEX FORMATION IN A POWERPLANT COLLECTION BASIN,
Florida Univ., Gainesville. Coastal and Oceanographic Engineering Lab.
Y-H. Wang, G. Powell, and J. B. Miller, Jr.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 335-342, 1978. 4 Fig, 2 Tab.

Descriptors: *Vortices, *Structures, *Discharge(Water), *Model studies, Hydraulic models, Pipes, Flow, Air entrainment, Water levels, Basins, Heated water, Powerplants, Hydraulics, Discharge structures.

During the design of a basin to collect hot water from three units of a southeastern utility's central power station, concern arose as to whether a vortex would form at the entrance to the discharge pipe from the basin. The collection basin and discharge pipe are being constructed in order to relocate the plant's thermal discharge from its current location in a tidal estuary to a large river approximately 3000 feet away. The maximum flow rate through the 196 inch pipe would be 569,000 gpm. This question of a vortex formation is difficult to answer due to the complicated dynamics and boundary conditions. Since this problem was not amenable to purely analytical techniques, a hydraulic model was deemed most appropriate. The objectives of the model study were to determine qualitatively: (1) whether there would be a vortex formation at the entrance to the discharge pipe capable of entraining air into the pipeline, and (2) if so, what measures could be taken to alleviate such a problem. (See also W80-05159) (Sims-ISWS)
W80-05188

COMPOUND WEIR DISCHARGE,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
F. W. Blaisdell, and C. L. Anderson.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 381-388, 1978. 4 Fig, 1 Ref, 2 Append.

Descriptors: *Weirs, *Discharge(Water), *Channels, *Model studies, Mathematical models, Design, Structures, Hydraulic structures, Flow, Orifices, Orifice flow, Erosion, Hydraulics, Compound weirs.

A weir, U-shaped in plan and compound-trapezoidal-shaped in elevation, was sized to fit a head-discharge relationship predetermined by site requirements. An imposed site limitation was a constructed channel in a wide flood plain. The initial design was a box inlet weir, U-shaped in plan and trapezoidal in elevation. The bank-full capacity of this spillway exceeded the channel capacity. This caused the approach channel water surface to drop down upstream of the spillway. To prevent overbank flow from dropping into the approach channel and eroding the banks in the vicinity of the drop structure, the drop spillway capacity at bank-full head had to be decreased to equal the bank-full channel capacity. This was accomplished by a low level weir U-shaped in plan and trapezoidal in elevation of less capacity than the original weir. To limit the head rise for floods exceeding the channel capacity, a lengthened crest was required. This was accomplished by superimposing on the low level weir a long high level weir with its crest at the flood plain level. The high level weir was also U-shaped in plan and trapezoidal in elevation. The final weir proportions met the imposed requirements. The head-discharge relationship for the compound weir was mathematically modeled by developing (straightening out or linearizing) the U-shaped crest, separating the developed crest into elements, and analyzing the elements as rectangular and triangular weirs and a triangular orifice. The analysis was verified and the discharge coefficients were evaluated by a physical model. (See also W80-05159) (Sims-ISWS)

VERIFICATION OF PROTOTYPE SPILLWAY PERFORMANCE,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
C. L. Anderson, and F. W. Blaisdell.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 389-395, 1978. 7 Fig, 1 Ref.

Descriptors: *Spillways, *Hydraulic structures, *Model studies, Hydraulic models, Flow, Discharge(Water), Structures, Laboratory tests, Hydraulics, Drop spillways, Inlet structures.

Flow phenomena which could not be explained occurred in the principal spillway of the Marsh Creek Dam of the Marsh-Kellogg Watershed Project in Contra Costa County, California. Analyses of hydrologic data recorded in January 1967 revealed differing head-discharge relationships for rising and falling stages of the outflow. Also, during the falling stage of a January 1969 runoff, significant flow was observed through the spillway even though the reservoir level was below the spillway crest level. Engineers inspecting the spillway in June 1972 had differing explanations for the spillway performance and the effect of the air vents in the drop inlet. To resolve the differences expressed by experienced engineers and to explain the unusual performance of the prototype, a model study was conducted in 1973. The prototype and its performance and the model and its reproduction of the prototype performance were described and illustrated. (See also W80-05159) (Sims-ISWS)

ANALYSIS OF SUB- AND SUPERCRITICAL DAM-BREAK FLOWS,
Michigan State Univ., East Lansing. Dept. of Civil Engineering.
D. C. Wiggert, and C. S. Martin.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 680-689, 1978. 5 Fig, 13 Ref.

Descriptors: *Dam failure, *Waves(Water), *Theoretical analysis, *Mathematical models, Flow, Model studies, Flood waves, Bores, Analysis, Floods, Methodology, Numerical analysis, Analytical techniques, Subcritical flow, Supercritical flow, Dam break, Method of characteristics.

Following a review of the analytical solution, two numerical models were adapted to model the idealized sudden dam break flow. The method of characteristics and the implicit scheme employ a fixed grid in the time-distance plane and are known to possess the ability to transmit discontinuities, or bores, of weak to moderate strength. In addition, the method of characteristics can facilitate subcritical or supercritical flows. Based on the criterion of bore height and discharge at the dam, the implicit scheme and the method of characteristics were shown to approximate the idealized dam break solution in which initial flow in the system may exist. Whereas the implicit scheme is valid only for subcritical flows, the method of characteristics can be applied to a mixed flow regime. (See also W80-05159) (Humphreys-ISWS)

VERIFICATION OF TRANSIENT MIXED-FLOW MODEL,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
C. C. S. Song.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 690-701, 1978. 6 Fig, 8 Ref.

Descriptors: *Mathematical models, *Mixing, *Flow, Model studies, Calibrations, Open channel flow, Closed conduit flow, Analytical techniques, Mathematics, Analysis, Hydraulic models, Mixed flow.

In order to optimize the use of existing or new combined sewer systems for pollution abatement, it may be necessary to make use of the in-line storage capacity as well as their capacity to convey water and sewage. Flow in such a system would undergo the change of flow regimes in a typical sequential manner, open channel-mixed-closed conduit-mixed-open channel, at a large storm event. A mathematical model capable of dealing with the unsteady variable regime flows is necessary to help design such a system. This paper explained some features and the calibration process of a model constructed for the Pure Water District of Monroe County, New York. It was demonstrated by comparing a physical model with a mathematical model that the transient flows with phase change can be satisfactorily modeled mathematically. The major problem in the mathematical model is the jump condition associated with the moving interface. (See also W80-05159) (Humphreys-ISWS)

DEVELOPMENT OF MAKEUP LINE SAFE OPERATING CRITERIA,
Bechtel Inc., Norwalk, CA.
P. K. Su, and I. Joseph.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 702-714, 1978. 8 Fig, 2 Tab, 1 Ref, 1 Append.

Descriptors: *Unsteady flow, *Pipelines, *Flow system, *Model studies, Thermal powerplants, Pressure conduits, On-site tests, Computer models, Pumping, Water delivery, Automatic control, Hydraulics, Flow, Fluctuations, Operations, Simulation analysis, Water levels, Pressure, Makeup water.

A field experiment and mathematical analysis of the hydraulic transients were performed on the makeup lines of the Navajo Generating Station. The makeup line hydraulic transient analysis was performed using Bechtel's hydraulic transient analysis program. This transient analysis was performed to calibrate the computer model in order to reproduce the field data. After adjusting the head loss coefficients of the pipeline and the shock-trap orifice in the mathematical model, the results show a satisfactory agreement between the measured and calculated transient response at the shock-traps and several points along the pipeline. The mathematical model was then used to develop system operating criteria which includes automatic control of the water levels in the shock-trap for various flow rates. The system is protected from adverse tran-

sient effects due to power interruptions. (See also W80-05159) (Humphreys-ISWS)

THE LOYALSOCK CREEK MODEL STUDY,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
A. C. Miller, R. A. Chadderton, and S. A. Brown.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 745-752, 1978. 1 Fig, 2 Tab, 9 Ref.

Descriptors: *Hydraulic models, *Bank erosion, *Streams, *Pennsylvania, Model studies, Erosion control, Bank protection, Calibrations, Backwater, Profiles, Slope protection, Floods, *Loyalsock Creek(PA).

A physical model of the Loyalsock Creek meander immediately upstream of Pennsylvania State Highway 220 (Legislative Route 1073, Section C-17) was constructed on a 1 to 90 scale, both in the vertical and horizontal dimensions. The undistorted model was constructed to achieve quantitative velocity and depth measurements for a wide range of flow magnitudes. No attempt was made to model a partially moveable boundary because of the restrictively small model scales involved. The study has progressed with testing and analysis of the undistorted, fixed bed model, Phase I. Model data and analyses presented indicate a substantial potential for further erosion of the east bank of Loyalsock Creek as the meander continues to grow. Flood flows will also create potential to erode the existing rock protection that has placed along the south bank of the Mill Creek realignment channel and the lower east bank of Loyalsock Creek. Phase I testing did not indicate any eminent danger of the highway embankment being breached from any one particular storm; however, long-term effects were not studied and will be included in the second phase of the research. UNIFIED PRESENTATION OF BUOYANT SURFACE JETS IN THREE DIMENSIONS,
McGill Univ., Montreal (Quebec). Dept. of Civil Engineering and Applied Mechanics.
R. E. Baddour, and V. H. Chu.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 811-818, 1978. 6 Fig, 8 Ref.

Descriptors: *Jets, *Buoyancy, *Flow characteristics, *Model studies, Laboratory tests, Flow, Analysis, Analytical techniques, Turbulent flow, Spatial distribution, Saline water, Heated water, Freshwater, *Surface jets, Buoyant jets, Wall jets, Two phase flow.

The paper discussed a buoyant wall jet in three dimensions. The wall jet was simulated in the laboratory by injecting saline water along a flat bottom in a tank of fresh water of lighter density. Basic properties related to the development of three-dimensional buoyant shear layers in general were discussed from the results of the wall jet experiment. These properties were used to interpret results of heated surface jets. The results presented are the first part of a larger investigation and perhaps raise more questions than can be answered. Future investigation should pay more attention to the temperature distribution in the region outside the turbulent core. The rather unusual buoyancy distribution presented has suggested a region of relatively high temperature which may occur on the two sides of the jet. (See also W80-05159) (Humphreys-ISWS)

BIFURCATION OF BUOYANT JETS IN A CROSSFLOW,
McGill Univ., Montreal (Quebec). Dept. of Civil Engineering and Applied Mechanics.
M. S. Abdelwahed, and V. H. Chu.
In: Verification of Mathematical and Physical Models in Hydraulic Engineering; Proceedings of the 26th Annual Hydraulics Division Specialty Conference, Maryland University, College Park, August 9-11, 1978, p 819-826, 1978. 10 Fig, 3 Ref.

Descriptors: *Jets, *Flow characteristics, *Model studies, Laboratory tests, Open channel flow, Analysis, Analytical techniques, Data collections, Spatial distribution, *Buoyant jets, Crossflow, Bifurcation, Two phase flow.

Bifurcated jets were simulated in the laboratory by discharging hot or cold water into an open channel crossflow through an orifice located at the channel bottom. The jet was observed first to bend over and form a pair of vortex-like turbulent elements. As the jet impinged on the free surface, it bifurcated into two separated regions; between them a clear space extended continuously. Due to restriction by the width of the crossflow channel, it has not been possible to investigate quantitatively the spreading behavior of the bifurcated jet in the far field region. But based on some qualitative observations at very low crossflow velocity, the pair of bifurcated vortex was observed in the far field region to break down into two rolls of counterrotating vortex street. The breakdown is apparently the result of suppression of vertical motion due to gravity stratification. In the course of rotating the vortex vector toward the vertical direction the vortex pair breaks down into vortex street. It is difficult to know whether entrainment would stop in a vortex street. The entrainment coefficient obtained in the present experiment was found to depend rather weakly on the Richardson number. This might be an indication that entrainment does not vanish but approaches a constant in the far field region. Further experimentation in a wider channel is obviously needed to settle this question. Observations of Mesoscale Winds in Lower Cook Inlet, Alaska - March 1978,
W80-05347 5A

Meteorology of the Alaskan Arctic Coast,
W80-05351 5C

BAYS
Verification of Finite Element Hydrodynamic Model Cafe,
W80-05202 2L

Tidal Circulation in Coastal Seas,
W80-05204 2L

BEACH
Biogenic Sedimentary Structures Produced by crabs in Lagoon Margin and Salt Marsh Environments Near Beaufort, North Carolina,
W80-05320 2I

BEACHES
Local and Shoaled Comparisons of Sea Surface Elevations, Pressures, and Velocities,
W80-05150 2L

BED LOAD
Bed Load: Definition and Measurement,
W80-05231 7B

BED LOAD SAMPLERS
Bed Load: Definition and Measurement,
W80-05231 7B

BEDS UNDER WATER
Judicial Deference in the Submerged Lands Cases,
W80-05393 6E

BENTHOS
Benthic Diversity and Substrate-Fauna Associations in Lake Superior,
W80-05267 2H

BERING STRAIT
Ice Breakout in the Bering Strait,
W80-05360 5A

BIG ISLAND WILDLIFE AREA (OHIO)
Hydraulic Properties of a Limestone-Dolomite Aquifer Near Marion, North-Central Ohio,
W80-05306 2F

BIOCHEMISTRY
A Mathematical Model for Water Quality Analysis,
W80-05190 5B

BIOINDICATORS
Transplanting Aquatic Bryophytes to Assess River Pollution,
W80-05311 5A

Accumulation of Tin by Mangrove Species in West Malaysia,
W80-05325 2I

BIOLOGICAL COMMUNITIES
Using Artificial Streams to Evaluate Perturbation Effects on Aufwuchs Structure and Function,
W80-05260 5A

BIOMASS
Benthic Diversity and Substrate-Fauna Associations in Lake Superior,
W80-05267 2H

BISCAYNE BAY (FL)
Verification of Finite Element Hydrodynamic Model Cafe,
W80-05202 2L

BOGS
Identification of Plant Fragments and Pollen from Peat Deposits in Rangitaiki Plains and Maketu Basins,
W80-05326 2I

BOREHOLES
Analysis of Borehole Infiltration Tests Above the Water Table,
W80-05108 2G

BOSSIELLA
Growth and Primary Productivity of Marine Macrophytes Exposed to Domestic Sewage Effluents,
W80-05250 5C

BOUNDARIES (PROPERTY)
Coastal Energy Impact Program Boundaries on the Atlantic Coast: A Case Study of the Law Applicable to Lateral Seaward Boundaries,
W80-05371 6E

BOUNDARY DISPUTES
Coastal Energy Impact Program Boundaries on the Atlantic Coast: A Case Study of the Law Applicable to Lateral Seaward Boundaries,
W80-05371 6E

U.S. Position on Negotiations Concerning the Great Lakes,
W80-05390 6E

BRISTOL BAY (AK)
Bristol Bay Oceanographic Processes (B-BOP),
W80-05344 5A

BRITAIN
The Occurrence of Bryophytes on British Saltmarshes,
W80-05308 2I

BUFFALO FISH
Experiments in Recycling Swine Manure in Fishponds,
W80-05333 5C

BUOYANCY
Unified Presentation of Buoyant Surface Jets in Three Dimensions,
W80-05237 8B

BUOYANT JETS
Bifurcation of Buoyant Jets in a Crossflow,
W80-05238 8B

BURROWS
Biogenic Sedimentary Structures Produced by crabs in Lagoon Margin and Salt Marsh Environments Near Beaufort, North Carolina,
W80-05320 2I

CADDO RIVER (AR)
Coliforms and Water Quality: Use of Data in Project Design and Operation,
W80-05262 5B

CALIBRATIONS
The Effect of Data Independence in Model Calibration and Model Testing,
W80-05141 7C

CALIFORNIA
The Effect of Precipitation Patterns on Surface Runoff,
W80-05233 2A

Dissolved Oxygen in Intragravel Water of Three Tributaries to Redwood Creek, Humboldt County, California,
W80-05259 5B

A Plan to Study the Aquifer System of the Central Valley of California,
W80-05296 6A

Hydrological Features of a California Coastal Fen,
W80-05310 2H

Assessment of Effects of Altered Stream Flow Characteristics on Fish and Wildlife. Part B: California, Executive Summary,
W80-05324 6G

Saving the Coast: The California Coastal Zone Conservation Act of 1972.
W80-05377 6E

Coastal Land Management in California,
W80-05378 6E

Liquefied Natural Gas Terminal Siting in the California Coastal Zone: The Scope of Permissible State Authority,
W80-05383 6E

CANADA
Point Bar and Floodplain Formation of the Meandering Beatton River, Northeastern British Columbia, Canada,
W80-05144 2J

U.S. Position on Negotiations Concerning the Great Lakes,
W80-05390 6E

Canada's Interests as Regards Protection and Regulation of the Great Lakes,
W80-05395 6E

CANALS
Surface Flow in a Two-Bay Water Diversion,
W80-05197 8A

CARBONATE ROCKS
The Silurian Salt Deposits in Eastern Lake, Northwestern Ashtabula, and Northeastern Geauga Counties, Ohio,
W80-05295 5E

CAROLINA BEACH INLET (NC)
Verification of a Numerical Flow Model for Carolina Beach Inlet, North Carolina,
W80-05203 2L

CEDAR CREEK (IND)
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation

Study for Cedar Creek, Dekalb and Allen Counties, Indiana,
W80-05302 5B

CELERITY
Applicability of Kinematic and Diffusion Models,
W80-05214 2E

CHANNEL EROSION
Estimating the Risk of Channel Erosion,
W80-05209 2J

CHANNEL MORPHOLOGY
Point Bar and Floodplain Formation of the Meandering Beatton River, Northeastern British Columbia, Canada,
W80-05144 2J

CHANNELS
A Note on Changes in Channel Geometry at Tributary Junctions,
W80-05143 2E

Physical Model Study for Improved Navigation Channel Design,
W80-05182 8B

Mathematical Models for Navigation Channel Design,
W80-05183 8B

Compound Weir Discharge,
W80-05194 8B

CHARLESTON HARBOR (SC)
A Dynamic Estuary Model of Charleston Harbor,
W80-05178 2L

CHEMICAL REACTIONS
Modern Marine Sediments as a Natural Analog to the Chemically Stressed Environment of a Landfill,
W80-05293 5B

CHEMICAL WASTES
Digital-Transport Model Study of Diisopropylmethylphosphonate (DIMP) Ground-Water Contamination at the Rocky Mountain Arsenal, Colorado,
W80-05297 5B

CHLORIDES
Simulation of Water Circulations and Chloride Transports in Lake Superior for Summer 1973,
W80-05280 2H

CHLORINATION
Virus Removal by Advanced Wastewater Treatment.
W80-05106 5D

CHLOROPHYLL
The Effect of Tidal Resuspension on the Distribution of Intertidal Epipelic Algae in an Estuary,
W80-05132 2L

Statistical Evaluation of the Relationships Between Phytoplankton Biomass, Chlorophyll A, and Primary Production in Lake Superior,
W80-05270 2H

Growth, Chlorophyll and Mineral Nutrient Studies on Phalaris Arundinaceae L. in Three Scottish Lochs,
W80-05319 2I

CHOWAN RIVER (VA
Simulation of Algal Growth in the Chowan River,
W80-05181 5C

CHOWAN RIVER (VA-NC)
Water Quality Modeling in the Upper Reaches of the Chowan River,
W80-05253 5B

CHROMATOLOGY
Concentration and Fractionation of Hydrophobic Organic Acid Constituents from Natural Waters by Liquid Chromatography,
W80-05301 1B

CIRCULATION
Time Scales in Wind-Driven Lake Circulations,
W80-05255 2H

Simulation of Water Circulations and Chloride Transports in Lake Superior for Summer 1973,
W80-05280 2H

Characterization of the Nearshore Hydrodynamics of an Arctic Barrier Island-Lagoon System,
W80-05353 5C

CITIES
Linearized Subhydrographs Urban Runoff Model,
W80-05234 2A

CIVIL ENGINEERING
Current Computer Practices Within Civil Engineering,
W80-05235 7C

CLIMATOLOGY
Environmental Climatology of Lake Superior,
W80-05284 2H

Observations of Mesoscale Winds in Lower Cook Inlet, Alaska - March 1978,
W80-05347 5A

CLINTON COUNTY (IND)
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for South Fork Wildcat Creek, Clinton County, Indiana,
W80-05299 6A

CLOUD PHYSICS
Users Guide for the Analysis and Interpretation of Satellite Imagery on the High Plains Summer Cloud and Mesoscale Systems,
W80-05111 7B

COASTS
Approximation for Salt-Water Intrusion in Unconfined Coastal Aquifer,
W80-05126 2L

Velocity Profiles Over a Rippled Bed and the Threshold of Movement of Sand,
W80-05133 2L

Temporal and Spatial Variability in Longshore Motion along the Texas Gulf Coast,
W80-05151 2L

Field Verification of Sediment Transport Model,
W80-05228 2L

The Urban Coast From a National Perspective,
W80-05363 6E

Energy Facility Siting in the Urban Coastal Zone: Compatible or Not,
W80-05365 6E

Coastal Zone Management: The First Five Years and Beyond,
W80-05366 6E

Coastal Land Management in California,
W80-05378 6E

Problems and Prospects of Coastal Zone Management: An Environmental Viewpoint,
W80-05379 6E

COLD REGIONS
Wastewater Treatment in Cold Regions by Overland Flow,
W80-05112 5D

COLIFORMS
Coliforms and Water Quality: Use of Data in Project Design and Operation,
W80-05262 5B

COLORADO
Irrigator Involvement in the Implementation of Agricultural Nonpoint Source Pollution Control Programs,
W80-05257 5G

COMBINED SEWERS
Optimum Alternatives for Controlling Combined Sewage Overflows--A Case Study,
W80-05170 6B

COMMERCIAL FISHING
Fishermen's Contingency Fund (Final Regulations).
W80-05385 6E

COMMUNICATION
International Straits, Global Communications, and the Evolving Law of the Sea,
W80-05394 6E

COMPENSATION
Fishermen's Contingency Fund (Final Regulations).
W80-05385 6E

COMPUTER GRAPHICS
A Graphical Computation System for Three-Dimensional Lake Circulation and Contaminant Dispersion,
W80-05205 7C

COMPUTER MODELS
Mapping Model for Determining Land Suitable for Irrigation,
W80-05246 7C

Contribution of Groundwater Modeling to Planning,
W80-05300 6A

COMPUTER PROGRAMS
A Graphical Computation System for Three-Dimensional Lake Circulation and Contaminant Dispersion,
W80-05205 7C

Current Computer Practices Within Civil Engineering,
W80-05235 7C

COMPUTERS
Current Computer Practices Within Civil Engineering,
W80-05235 7C

CONFERENCES
Verification of Mathematical and Physical Models in Hydraulic Engineering.
W80-05159 2A

CONSERVATION
Saving the Coast: The California Coastal Zone Conservation Act of 1972.
W80-05377 6E

CONTINENTAL SHELF
Coastal Energy Impact Program: Regulations to Establish the Outer Continental Shelf (OCS) State Participation Grant Program (Final Rules).
W80-05384 6E

Fishermen's Contingency Fund (Final Regulations).
W80-05385 6E

Rational Development of Outer Continental Shelf Oil and Gas,
W80-05386 6E

Comparative National Legislation on Offshore Pollution,
W80-05391 6E

COOLING POND
Investigations of Sparging as a Method for Promoting Cooling Pond Heat Transfer,
W80-05152 2H

COOLING WATER
Investigations of Sparging as a Method for Promoting Cooling Pond Heat Transfer,
W80-05152 2H

Field Verification of a Hydrothermal Model,
W80-05187 5B

CORALLINA
Growth and Primary Productivity of Marine Macrophytes Exposed to Domestic Sewage Effluents,
W80-05250 5C

CORN
The Economic Consequences of Irrigating Corn on Fine Textured Soils in the Humid Midwest,
W80-05102 6B

CRABS
Biogenic Sedimentary Structures Produced by crabs in Lagoon Margin and Salt Marsh Environments Near Beaufort, North Carolina,
W80-05320 2I

CROSS-SECTIONS
Composite Roughness of Natural Channels,
W80-05165 2E

CRUSTACEANS
Crustacean Zooplankton of Lake Superior,
W80-05269 2H

CURRENTS (WATER)
Temporal and Spatial Variability in Longshore Motion along the Texas Gulf Coast,
W80-05151 2L

Verification of a Numerical Flow Model for Carolina Beach Inlet, North Carolina,
W80-05203 2L

Data Processing and Analysis from H-F Radar Data Obtained in Cook Inlet Alaska During Summers 1977 and 1978,
W80-05337 5A

A New Technique for Measuring Tidal Currents Using a Two-Site HF Doppler Radar System,
W80-05338 5A

Current Measurements in Possible Dispersal Regions of the Beaufort Sea,
W80-05342 5A

Northwest Gulf of Alaska Shelf Circulation,
W80-05343 5A

Bristol Bay Oceanographic Processes (B-BOP),
W80-05344 5A

Modeling of Tides and Circulations of the Bering Sea,
W80-05350 5A

Beaufort and Chukchi Sea Ice Motion. Part 1: Pack Ice Trajectories,
W80-05358 5A

DAM FAILURE
Analysis of Sub- and Supercritical Dam-Break Flows,
W80-05223 8B

DAMAGES
Fishermen's Contingency Fund (Final Regulations).
W80-05385 6E

DAMS
An Experimental Investigation of Uplift Pressures,
W80-05196 8A

DATA COLLECTIONS
Hydrologic Characteristics of Australian Streams,
W80-05120 2E

DATA PROCESSING
Smoothed Data and Gradients Using Sliding Polynomials with Optional Controls,
W80-05140 7C

Phytoplankton-Zooplankton Associations in Lake Superior: A Statistical Approach,
W80-05268 2H

Data Processing and Analysis from H-F Radar Data Obtained in Cook Inlet Alaska During Summers 1977 and 1978,
W80-05337 5A

DATING
An Appraisal of Cultural and Paleontological Resources Within Sections 1 and 2 of the Proposed Mirdan Canal Project, Garfield and Valley Counties, Nebraska,
W80-05109 6B

Final Report on Sampling and Evaluation of Archaeological and Historical Sites in or Near Bureau of Reclamation's Authorized Salmon Falls Division, Twin Falls and Cassia Countries, Idaho,
W80-05113 6B

DECISION ANALYSIS
Applications and Evaluation of Decision Analysis in Water Resources Planning,
W80-05104 6A

DECISION MAKING
Applications and Evaluation of Decision Analysis in Water Resources Planning,
W80-05104 6A

Optimum Alternatives for Controlling Combined Sewage Overflows--A Case Study,
W80-05170 6B

Comparison of Stormwater Detention Policies,
W80-05241 2A

DEGRADATION (DECOMPOSITION)
Experimental Degradation of Detritus made from the Salt Marsh Plants Spartina Alterniflora Loisel., Salicornia Virginica L., and Juncus Roemerianus Scheele,
W80-05321 2I

DEGRAY RESERVOIR (AR)
Coliforms and Water Quality: Use of Data in Project Design and Operation,
W80-05262 5B

DEKALB COUNTY (IND)
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for Cedar Creek, Dekalb and Allen Counties, Indiana,
W80-05302 5B

DELAWARE RIVER
Report of the River Master of the Delaware River for the Period December 1, 1977 -- November 30, 1978,
W80-05292 6D

DELAWARE RIVER MASTER
Report of the River Master of the Delaware River for the Period December 1, 1977 -- November 30, 1978,
W80-05292 6D

DEPOSITION (SEDIMENTS)
A Small Cliff-Bound Estuarine Environment: Sandyhaven Pill in South Wales,
W80-05146 2L

DESCHUTES RIVER (WA)
Deschutes River Basin Suspended Sediment Transport Study,
W80-05153 2J

DETENTION RESERVOIRS
Water Quality Trap Efficiency of Storm Water Management Basins,
W80-05139 5G

Comparison of Stormwater Detention Policies,
W80-05241 2A

DETRITUS
Experimental Degradation of Detritus made from the Salt Marsh Plants Spartina Alterniflora Loisel., Salicornia Virginica L., and Juncus Roemerianus Scheele,
W80-05321 2I

DIFFUSION
An Application of Brutsaert's and Optimization Techniques to the Nonlinear Diffusion Equation: The Influence of Tailing,
W80-05136 2G

Effects of Equation Averaging on Model Verification,
W80-05200 2E

Northwest Gulf of Alaska Shelf Circulation,
W80-05343 5A

DIGITAL TRANSPORT MODEL
Digital-Transport Model Study of Diisopropylmethylphosphonate (DIMP) Ground-Water Contamination at the Rocky Mountain Arsenal, Colorado,
W80-05297 5B

DIISOPROPYLMETHYLPHOSPHONATE
Digital-Transport Model Study of Diisopropylmethylphosphonate (DIMP) Ground-Water Contamination at the Rocky Mountain Arsenal, Colorado,
W80-05297 5B

DISCHARGE (WATER)
Hydrologic Characteristics of Australian Streams,
W80-05120 2E

Vortex Formation in a Powerplant Collection Basin,
W80-05188 8B

Compound Weir Discharge,
W80-05194 8B

DISPERSION
Two-Dimensional Tidally Averaged Estuarine Model,
W80-05251 2L

Turbidity Dispersion in Lake Superior Through Use of Landsat Data,
W80-05278 2H

Current Measurements in Possible Dispersal Regions of the Beaufort Sea,
W80-05342 5A

Northwest Gulf of Alaska Shelf Circulation,
W80-05343 5A

DISSOLVED OXYGEN
Dissolved Oxygen in Intragravel Water of Three Tributaries to Redwood Creek, Humboldt County, California,
W80-05259 5B

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for South Fork Wildcat Creek, Clinton County, Indiana,
W80-05299 6A

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation

Study for Cedar Creek, Dekalb and Allen Counties, Indiana,
W80-05302 5B

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for Wildcat Creek, Howard County, Indiana,
W80-05303 5B

DISTILLATION
Concentration and Fractionation of Hydrophobic Organic Acid Constituents from Natural Waters by Liquid Chromatography,
W80-05301 1B

DISTRIBUTION PATTERNS
The Effect of Precipitation Patterns on Surface Runoff,
W80-05233 2A

Stochastic Analysis of Annual Rainfall Affected by Urbanization,
W80-05331 2B

DIVERSION
Sediment Model Verification for Small Diversions,
W80-05230 2J

DIVERSION STRUCTURES
Surface Flow in a Two-Bay Water Diversion,
W80-05197 8A

DRAWDOWN
Computationally Efficient Polynomial Approximations Used to Program the Theis Equation,
W80-05121 6A

Determination of Aquifer Parameters from Step Tests and Intermittent Pumping Data,
W80-05125 2F

DROUGHTS
Empirically Derived Probability Estimates of Drought Parameters for Western United States Back to 1700 A.D.,
W80-05247 2B

DUG WELLS
Roman Wells,
W80-05245 8A

DULUTH BASIN
Benthic Diversity and Substrate-Fauna Associations in Lake Superior,
W80-05267 2H

E. COLI
Quantitatively Tracing Bacterial Transport in Saturated Soil Systems,
W80-05252 5B

ECONOMIC FEASIBILITY
The Economic Consequences of Irrigating Corn on Fine Textured Soils in the Humid Midwest,
W80-05102 6B

ECONOMIC IMPACT
A Dynamic Regional Impact Analysis of Federal Expenditures of a Water and Related Land Resource Project -- The Boise Project of Idaho, Part II: Secondary Economic Impacts of the Boise Project of Idaho, 1947-1970,
W80-05243 6B

Federal Control of Water Pollution - An Ounce of Prevention is Worth a Pound of Cure,
W80-05374 6E

ECONOMICS
Lake Superior in the 21st Century,
W80-05265 6B

ECOSYSTEMS
Verification of a York River Ecosystem Model,
W80-05180 5C

Sources, Transport Pathways, Depositional Sites and Dynamics of Sediments in the Lagoon and Shallow Marine Region, Northern Arctic Alaska,
W80-05354 5C

EDWARDS AQUIFER (TX)
Calibration of the Edwards Aquifer Model,
W80-05167 2F

EFFECTS
Assessing Land Use Changes With an Urban Runoff Model,
W80-05239 2A

EFFICIENCIES
Experimental Degradation of Detritus made from the Salt Marsh Plants Spartina Alterniflora Loisel., Salicornia Virginica L., and Juncus Roemerianus Scheele,
W80-05321 2I

EFFLUENTS
Measuring Effluent Plumes,
W80-05162 5A

ENERGY
Energy Facility Siting in the Urban Coastal Zone: Compatible or Not,
W80-05365 6E

Unresolved Issues of Coastal Zone Management,
W80-05368 6E

Geothermal Development and Western Water Law,
W80-05372 6E

ENERGY BUDGET
Energy Budget and Monthly Evaporation Estimates for Lake Superior, 1973,
W80-05282 2D

ENERGY CONSERVATION
Irrigation Management -- A Mechanism for Saving Energy and Water,
W80-05249 3F

ENERGY CONVERSION
Photosynthetically Active Radiation in a Stand of Phragmites Communis Trin. IV. Stochastic Model,
W80-05314 2H

ENGLAND
A Comparative Study of Nitrate Levels at Three Adjacent Ground-Water Sources in a Chalk Catchment Area West of London,
W80-05128 2F

ENGLAND COAST
Velocity Profiles Over a Rippled Bed and the Threshold of Movement of Sand,
W80-05133 2L

ENVIRONMENTAL EFFECTS
Water and the Environment -- A Scottish Solution,
W80-05117 6G

Modern Marine Sediments as a Natural Analog to the Chemically Stressed Environment of a Landfill,
W80-05293 5B

Oil Spill Vulnerability, Coastal Morphology, and Sedimentation of Kotzebue Sound,
W80-05339 5C

EQUATIONS
Estimating the C Factor in the Universal Soil Loss Equation for Landscaped Slopes,
W80-05147 2J

Estimating the C Factor in the Universal Soil Loss Equation for Landscaped Slopes: A Field Rating System,
W80-05148 2J

Effects of Equation Averaging on Model Verification,
W80-05200 2E

EQUIPMENT
Modifying Automated Pumping Samplers for Use in Small Mountain Streams,
W80-05256 5A

EROSION
Estimating the C Factor in the Universal Soil Loss Equation for Landscaped Slopes,
W80-05147 2J

Estimating the C Factor in the Universal Soil Loss Equation for Landscaped Slopes: A Field Rating System,
W80-05148 2J

Surface Mining and the Hydrologic Balance,
W80-05334 4C

Bottom and Near-Bottom Sediment Dynamics in Lower Cook Inlet,
W80-05349 5B

EROSION CONTROL
Hydroseeding Forest Roadsides in British Columbia for Erosion Control,
W80-05149 4D

EROSION RATES
Reconnaissance Assessment of Erosion and Sedimentation in the Canada de Los Alamos Basin, Los Angeles and Ventura Counties, California,
W80-05305 2J

ESTIMATING
Estimating the Risk of Channel Erosion,
W80-05209 2J

ESTUARIES
Comparative Nutrient Dynamics of a Marsh-Mudflat Ecosystem,
W80-05131 5B

The Effect of Tidal Resuspension on the Distribution of Intertidal Epipelic Algae in an Estuary,
W80-05132 2L

A Small Cliff-Bound Estuarine Environment: Sandyhaven Pill in South Wales,
W80-05146 2L

Comparison of Verified Physical and Mathematical Model,
W80-05177 2L

Verification of an Estuarine Model for Apalachicola Bay, Florida,
W80-05179 2L

Verification of a York River Ecosystem Model,
W80-05180 5C

Verification of Finite Element Hydrodynamic Model Cafe,
W80-05202 2L

Verification of Fixed-Bed Estuarine Models,
W80-05211 2L

Two-Dimensional Tidally Averaged Estuarine Model,
W80-05251 2L

ESTUARINE ENVIRONMENT
A Small Cliff-Bound Estuarine Environment: Sandyhaven Pill in South Wales,
W80-05146 2L

EVALUATION
Final Report on Sampling and Evaluation of Archaeological and Historical Sites in or Near Bureau of Reclamation's Authorized Salmon Falls Division, Twin Falls and Cassia Countries, Idaho,
W80-05113 6B

Reconnaissance Snow Surveys of the National Petroleum Reserve in Alaska, April 1977 and April-May 1978,
W80-05294 2C

EVAPORATION
Energy Budget and Monthly Evaporation Estimates for Lake Superior, 1973,
W80-05282 2D

Simple Models for Calculating Evaporation from Dry and Wet Tundra Surfaces,
W80-05316 2I

EVAPORATION ESTIMATES
Energy Budget and Monthly Evaporation Estimates for Lake Superior, 1973,
W80-05282 2D

EVAPOTRANSPIRATION
Comparison Between Measured and Simulated Plant Water Potential During Soil Water Extraction by Potted Ryegrass,
W80-05138 2G

EXTRATROPICAL CYCLONES
The Response of Coastal Winds at Albatross Banks, Lower Cook Inlet, and Hinchinbrook Entrance to a Passing Synoptic Disturbance - Preliminary Analysis,
W80-05348 5A

FACILITIES
Evaluation of Membrane Processes and Their Role in Wastewater Reclamation,
W80-05105 5D

Energy Facility Siting in the Urban Coastal Zone: Compatible or Not,
W80-05365 6E

Unresolved Issues of Coastal Zone Management,
W80-05368 6E

FALLOUT
Reactor-Released Radionuclides and Fine-Grained Sediment Transport and Accumulation Patterns in Barnegat Bay, New Jersey and Adjacent Shelf Waters,
W80-05130 5B

FARM WASTES
Experiments in Recycling Swine Manure in Fishponds,
W80-05333 5C

FISH HATCHERIES
Availability of Supplemental Water Supplies at Salmonid Fish-Propagation Stations in Wisconsin,
W80-05304 6D

FISHERIES
Management of Living Resources in the Northeast Pacific and the Unilateral Extension of the 200-Mile Fisheries Zone,
W80-05382 6E

FLOOD FORECASTING
NWS Operational Dynamic Wave Model,
W80-05198 2E

FLOOD PLAIN INSURANCE
Flood Hazard Identification and Flood Plain Management on Alluvial Fans,
W80-05264 2E

FLOOD PLAINS
Point Bar and Floodplain Formation of the Meandering Beatton River, Northeastern British Columbia, Canada,
W80-05144 2J

FLOOD ROUTING
The Numerical Dispersion of the Muskingum Method,
W80-05215 2E

FLOOD WAVES
Subcritical Kinematic Streamflow,
W80-05213 2E

Applicability of Kinematic and Diffusion Models,
W80-05214 2E

FLORIDA
Verification of an Estuarine Model for Apalachicola Bay, Florida,
W80-05179 2L

Upper St. Johns River Basin Water Management Model,
W80-05227 2A

Growth Inhibition of Hydrilla Verticillata by Selected Lake Sediment Extracts,
W80-05258 2H

A Digital Overlay Technique for Evaluation of Potential Infiltration and Recharge,
W80-05261 4A

Water in the Pensacola, Florida, Area.
W80-05298 2A

FLOW
Radial Source-Sink Flow in Stratified Ocean,
W80-05186 8B

Model Verification Using the Plug-Flow Technique,
W80-05193 5B

Surface Flow in a Two-Bay Water Diversion,
W80-05197 8A

Effects of Equation Averaging on Model Verification,
W80-05200 2E

Verification of Transient Mixed-Flow Model,
W80-05224 8B

Ice Breakout in the Bering Strait,
W80-05360 5A

FLOW CHARACTERISTICS
Hydraulics of Flow in the Kaskaskia River,
W80-05166 2E

Unified Presentation of Buoyant Surface Jets in Three Dimensions,
W80-05237 8B

Bifurcation of Buoyant Jets in a Crossflow,
W80-05238 8B

Regional Stochastic Generation of Streamflows Using an Arima (1,0,1) Process and Disaggregation,
W80-05291 2E

FLOW CONTROL
Control of Unsteady Free-Surface Flow With Gates,
W80-05232 2E

FLOW SYSTEM
Development of Makeup Line Safe Operating Criteria,
W80-05225 8B

FLUVIAL SEDIMENT
A Factor Analysis of Elemental Associations in the Surface Microlayer of Lake Michigan and Its Fluvial Inputs,
W80-05254 2H

FOLIAR APPLICATION
Nitrogen Fertilizer Management of Vigorous Lemons and Nitrate-Pollution Potential of Groundwater,
W80-05103 5B

FORECASTING
Prediction of River Stages,
W80-05206 2E

FOREIGN COUNTRIES
Comparative National Legislation on Offshore Pollution,
W80-05391 6E

FRANCE
France: Where the Meter is 'Universal',
W80-05118 6C

GASES
Rational Development of Outer Continental Shelf Oil and Gas,
W80-05386 6E

GATES
Control of Unsteady Free-Surface Flow With Gates,
W80-05232 2E

GEOCHEMISTRY
A Factor Analysis of Elemental Associations in the Surface Microlayer of Lake Michigan and Its Fluvial Inputs,
W80-05254 2H

Modern Marine Sediments as a Natural Analog to the Chemically Stressed Environment of a Landfill,
W80-05293 5B

GEORGIA
Regulation of Sulfate Concentrations and Methanogenesis in Salt Marsh Soils,
W80-05134 2L

Petrography and Paleoecology of Holocene Peats from the Okefenokee Swamp-Marsh Complex of Georgia,
W80-05315 2H

GEORGIA COAST
Regulation of Sulfate Concentrations and Methanogenesis in Salt Marsh Soils,
W80-05134 2L

GEOTHERMAL STUDIES
Geothermal Development and Western Water Law,
W80-05372 6E

Geothermal Leasing,
W80-05388 6E

GHYBEN-HERZBERG LENS
Hawaiian Waste Injection Practices and Problems,
W80-05157 5E

GLEN LYN (VA)
Invasion, Population Dynamics and Elemental Accumulation of Corbicula Fluminea in the New River at Glen Lyn, Virginia,
W80-05332 5C

GOVERNMENT FINANCE
Effects of Rural Water Systems on Local Government Revenues and Expenditures in Selected Counties of South Dakota,
W80-05242 6B

GOVERNMENTAL INTERRELATIONS
State-Local Relations In Coastal Zone Management Implications For Change,
W80-05381 6E

Coastal Energy Impact Program: Regulations to Establish the Outer Continental Shelf (OCS) State Participation Grant Program (Final Rules).
W80-05384 6E

GRANTS
Coastal Energy Impact Program: Regulations to Establish the Outer Continental Shelf (OCS) State Participation Grant Program (Final Rules).
W80-05384 6E

GRAVELS
Dissolved Oxygen in Intragravel Water of Three Tributaries to Redwood Creek, Humboldt County, California,
W80-05259 5B

GREAT LAKES
Phytoplankton of Lake Superior 1973,
W80-05271 2H

Characteristics of the Thermal Regime of Lake Superior,
W80-05283 2H

Environmental Climatology of Lake Superior,
W80-05284 2H

Lake Superior Basin and Its Development,
W80-05287 2H

U.S. Heavy Metal Loadings to the Great Lakes: Estimates of Point and Nonpoint Contributions,
W80-05335 6A

Phosphorus Control Strategies at Municipal Wastewater Treatment Plants in the U.S. Great Lakes Basin,
W80-05336 5D

U.S. Position on Negotiations Concerning the Great Lakes,
W80-05390 6E

Canada's Interests as Regards Protection and Regulation of the Great Lakes,
W80-05395 6E

GROUND WATER MOVEMENT
Perturbation Solutions for Water-Table Aquifers,
W80-05158 2F

GROUNDWATER
Ground-Water Modeling: An Overview,
W80-05123 2F

Influence of Regolith Properties on Migration of Septic Tank Effluent,
W80-05124 5B

Aquifer Occurrence in the Fort Payne Formation,
W80-05127 2F

A Comparative Study of Nitrate Levels at Three Adjacent Ground-Water Sources in a Chalk Catchment Area West of London,
W80-05128 2F

Requirements of State Regulatory Agencies for Monitoring Ground-Water Quality at Waste Disposal Sites,
W80-05129 5A

An Evaluation of Illinois Laws and Regulations Related to the Quality of Ground Water.
W80-05154 6E

Calibration of the Edwards Aquifer Model,
W80-05167 2F

Steady State vs. Transient Parameter Estimation in Groundwater Systems,
W80-05168 2F

Groundwater Simulation for Koeberg Power Station,
W80-05174 2L

A Hybrid Computer System for Groundwater Modeling,
W80-05175 2F

Quantitatively Tracing Bacterial Transport in Saturated Soil Systems,
W80-05252 5B

Water Resources Data for West Virginia, Water Year 1978.
W80-05288 7C

Water Resources Data for Arizona, Water Year 1978.
W80-05289 7C

Water Resources Data for Montana, Water Year 1978.
W80-05290 7C

A Plan to Study the Aquifer System of the Central Valley of California,
W80-05296 6A

Digital-Transport Model Study of Diisopropylmethylphosphonate (DIMP) Ground-Water Contamination at the Rocky Mountain Arsenal, Colorado.
W80-05297 5B

Contribution of Groundwater Modeling to Planning,
W80-05300 6A

GROUNDWATER AVAILABILITY
Availability of Supplemental Water Supplies at Salmonid Fish-Propagation Stations in Wisconsin,
W80-05304 6D

GROUNDWATER MOVEMENT
Nitrogen and Phosphorus Hydrochemistry in Las Vegas Wash,
W80-05107 5C

Influence of Regolith Properties on Migration of Septic Tank Effluent,
W80-05124 5B

GROUNDWATER RECHARGE
A Digital Overlay Technique for Evaluation of Potential Infiltration and Recharge,
W80-05261 4A

GROUNDWATER RESOURCES
Water in the Pensacola, Florida, Area.
W80-05298 2A

GROWTH RATES
Growth and Primary Productivity of Marine Macrophytes Exposed to Domestic Sewage Effluents,
W80-05250 5C

GULF OF ALASKA
Circulation and Water Masses in the Gulf of Alaska,
W80-05345 5A

GULF OF MEXICO
Temporal and Spatial Variability in Longshore Motion along the Texas Gulf Coast,
W80-05151 2L

HABITAT IMPROVEMENT
The Stochastic Variation of Instream Values in Rivers,
W80-05217 5C

HALOPHYTES
Environmental Factors in Relation to the Salt Content of Salicornia Pacifica Var. Utahensis,
W80-05327 2I

HARBORS
Verification of a Storm Tide Model for Boston,
W80-05173 2L

A Dynamic Estuary Model of Charleston Harbor,
W80-05178 2L

An Electronic Model of Harbor Waves,
W80-05210 2H

HAWAII
Sediment Movement in a Small Humid Watershed,
W80-05220 2J

HAZARDOUS WASTES
EPA Sets Rules on Hazardous Wastes,
W80-05322 5G

HAZARDS
Dynamics of Near-Shore Ice,
W80-05341 5A

Bristol Bay Oceanographic Processes (B-BOP),
W80-05344 5A

HEAT
Characteristics of the Thermal Regime of Lake Superior,
W80-05283 2H

HEAT TRANSFER
Investigations of Sparging as a Method for Promoting Cooling Pond Heat Transfer,
W80-05152 2H

HEATED WATER
Field and Model Results for Multiport Diffuser Plume,
W80-05160 5B

Hydrothermal Analyses Using Computer Modeling and Field Studies,
W80-05161 5A

Invasion, Population Dynamics and Elemental Accumulation of Corbicula Fluminea in the New River at Glen Lyn, Virginia,
W80-05332 5C

HEAVY METALS
Limestone Liner for Landfill Leachates Containing Beryllium, Cadmium, Iron, Nickel, and Zinc,
W80-05137 5E

U.S. Heavy Metal Loadings to the Great Lakes: Estimates of Point and Nonpoint Contributions,
W80-05335 6A

Sources, Transport Pathways, Depositional Sites and Dynamics of Sediments in the Lagoon and Shallow Marine Region, Northern Arctic Alaska,
W80-05354 5C

HISTORY
Final Report on Sampling and Evaluation of Archaeological and Historical Sites in or Near Bureau of Reclamation's Authorized Salmon Falls Division, Twin Falls and Cassia Countries, Idaho,
W80-05113 6B

Petrography and Paleoecology of Holocene Peats from the Okefenokee Swamp-Marsh Complex of Georgia,
W80-05315 2H

Identification of Plant Fragments and Pollen from Peat Deposits in Rangitaiki Plains and Maketu Basins,
W80-05326 2I

Turn This Water Into Gold The Story of the Newlands Project,
W80-05328 6E

HOWARD COUNTY (IND)
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for Wildcat Creek, Howard County, Indiana,
W80-05303 5B

HUDSON RIVER
Sediment and PCB Transport Model of the Hudson River,
W80-05219 2J

HYDRAULIC MODELS
Verification of Mathematical and Physical Models in Hydraulic Engineering.
W80-05159 2A

Minimum Reynolds Numbers for Physical Model Similarity,
W80-05164 8B

Verification of Fixed-Bed Estuarine Models,
W80-05211 2L

The Loyalsock Creek Model Study,
W80-05229 8B

HYDRAULIC PROPERTIES
Hydraulic Properties of a Limestone-Dolomite Aquifer Near Marion, North-Central Ohio,
W80-05306 2F

HYDRAULIC SIMILITUDE
Minimum Reynolds Numbers for Physical Model Similarity,
W80-05164 8B

HYDRAULIC STRUCTURES
Field and Model Results for Multiport Diffuser Plume,
W80-05160 5B

Minimum Reynolds Numbers for Physical Model Similarity,
W80-05164 8B

Verification of Prototype Spillway Performance,
W80-05195 8B

An Experimental Investigation of Uplift Pressures,
W80-05196 8A

HYDRAULICS
Verification of Mathematical and Physical Models in Hydraulic Engineering.
W80-05159 2A

A Dynamic Estuary Model of Charleston Harbor,
W80-05178 2L

Introduction to Numerical Methods,
W80-05184 2E

HYDRODYNAMICS
A Mathematical Model for Water Quality Analysis,
W80-05190 5B

Verification of Finite Element Hydrodynamic Model Cafe,
W80-05202 2L

Characterization of the Nearshore Hydrodynamics of an Arctic Barrier Island-Lagoon System,
W80-05353 5C

HYDROGEOLOGY
Aquifer Occurrence in the Fort Payne Formation,
W80-05127 2F

A Comparative Study of Nitrate Levels at Three Adjacent Ground-Water Sources in a Chalk Catchment Area West of London,
W80-05128 2F

Groundwater Simulation for Koeberg Power Station,
W80-05174 2L

Hydraulic Properties of a Limestone-Dolomite Aquifer Near Marion, North-Central Ohio,
W80-05306 2F

HYDROGRAPH ANALYSIS
Linearized Subhydrographs Urban Runoff Model,
W80-05234 2A

HYDROLOGIC ASPECTS
Hydrological Features of a California Coastal Fen,
W80-05310 2H

HYDROLOGIC BUDGET
Major Ion Loadings to Lake Superior,
W80-05277 2H

Water Budgets for Lake Superior and Whitefish Bay,
W80-05281 2H

HYDROLOGIC DATA
Water Resources Data for West Virginia, Water Year 1978.
W80-05288 7C

Water Resources Data for Arizona, Water Year 1978.
W80-05289 7C

Water Resources Data for Montana, Water Year 1978.
W80-05290 7C

HYDROLOGIC SYSTEMS
Application of COSSARR Model in Central Java,
W80-05226 2A

HYDROLOGY
Hydrologic Characteristics of Australian Streams,
W80-05120 2E

The Effect of Data Independence in Model Calibration and Model Testing,
W80-05141 7C

Surface Mining and the Hydrologic Balance,
W80-05334 4C

HYDROSEEDING
Hydroseeding Forest Roadsides in British Columbia for Erosion Control,
W80-05149 4D

HYDROTHERMAL STUDIES
Hydrothermal Analyses Using Computer Modeling and Field Studies,
W80-05161 5A

A Three Dimensional Thermal Plume Model,
W80-05163 5A

ICE
Meteorology of the Alaskan Arctic Coast,
W80-05351 5C

ICE COVER
Oil Pooling Under Sea Ice,
W80-05356 5A

The Transport and Behavior of Oil Spilled in and Under Sea Ice,
W80-05357 5A

Beaufort and Chukchi Sea Ice Motion. Part 1: Pack Ice Trajectories,
W80-05358 5A

Beaufort and Chukchi Sea Ice Motion. Part 2: Onset of Large Scale Chukchi Sea Ice Breakout,
W80-05359 5A

ICE FLOW
Beaufort and Chukchi Sea Ice Motion. Part 2: Onset of Large Scale Chukchi Sea Ice Breakout,
W80-05359 5A

Ice Breakout in the Bering Strait,
W80-05360 5A

ICE TRAJECTORIES
Beaufort and Chukchi Sea Ice Motion. Part 1: Pack Ice Trajectories,
W80-05358 5A

IDAHO
Final Report on Sampling and Evaluation of Archaeological and Historical Sites in or Near Bureau of Reclamation's Authorized Salmon Falls Division, Twin Falls and Cassia Countries, Idaho,
W80-05113 6B

A Dynamic Regional Impact Analysis of Federal Expenditures of a Water and Related Land Resource Project -- The Boise Project of Idaho, Part II: Secondary Economic Impacts of the Boise Project of Idaho, 1947-1970,
W80-05243 6B

ILLINOIS
Water-Management Planning for Illinois Communities,
W80-05115 6B

An Evaluation of Illinois Laws and Regulations Related to the Quality of Ground Water.
W80-05154 6E

Hydraulics of Flow in the Kaskaskia River,
W80-05166 2E

IMPOUNDMENTS
Model Predictions of Effects of Impoundment on Particulate Organic Matter Transport in a River System,
W80-05116 2J

INDIAN RESERVATIONS
Reclamation and the Red Man: Relationships on the Truckee-Carson Project, Nevada,
W80-05329 6E

Indian Reserved Water Rights: The Winters of our Discontent.
W80-05369 6E

Aboriginal Water Rights,
W80-05398 6E

Considerations and Conclusions Concerning the Transferability of Indian Water Rights,
W80-05399 6E

INDIANA
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for South Fork Wildcat Creek, Clinton County, Indiana,
W80-05299 6A

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for Cedar Creek, Dekalb and Allen Counties, Indiana,
W80-05302 5B

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for Wildcat Creek, Howard County, Indiana,
W80-05303 5B

INDUSTRIAL WASTES
Ultrafiltration Treatment of Poultry Processing Wastewater and Recovery of a Nutritional By-Product,
W80-05330 5D

INFILTRATION
Analysis of Borehole Infiltration Tests Above the Water Table,
W80-05108 2G

A Digital Overlay Technique for Evaluation of Potential Infiltration and Recharge,
W80-05261 4A

INJECTION WELLS
Programmable Hand Calculator Programs for Pumping and Injection Wells: II--Constant Pumping (Injection) Rate, Single Fully Penetrating Well, Semiconfined Aquifer,
W80-05122 6A

Hawaiian Waste Injection Practices and Problems,
W80-05157 5E

INLETS (WATERWAYS)
Verification of a Numerical Flow Model for Carolina Beach Inlet, North Carolina,
W80-05203 2L

INPUT-OUTPUT ANALYSIS
A Dynamic Regional Impact Analysis of Federal Expenditures of a Water and Related Land Resource Project -- The Boise Project of Idaho, Part II: Secondary Economic Impacts of the Boise Project of Idaho, 1947-1970,
W80-05243 6B

INSTRUMENTATION
Water-Manometer Tensiometers Installed and Read from the Land Surface,
W80-05307 2G

INTERNATIONAL COMMISSIONS
Environmental Law - A Survey of International Marine Pollution Control: Prelude to Geneva,
W80-05396 6E

INTERNATIONAL WATERS
Controlling Marine Pollution - World Task or National.,
W80-05389 6E

INTERTIDAL ZONE
Airborne Multispectral Survey of Intertidal Vegetation in Alaska,
W80-05313 2I

INTRAGRAVEL WATER
Dissolved Oxygen in Intragravel Water of Three Tributaries to Redwood Creek, Humboldt County, California,
W80-05259 5B

INVASION
Invasion, Population Dynamics and Elemental Accumulation of Corbicula Fluminea in the New River at Glen Lyn, Virginia,
W80-05332 5C

IONS
Major Ion Loadings to Lake Superior,
W80-05277 2H

IRRIGABLE LAND
Mapping Model for Determining Land Suitable for Irrigation,
W80-05246 7C

IRRIGATION
The Economic Consequences of Irrigating Corn on Fine Textured Soils in the Humid Midwest,
W80-05102 6B

Irrigator Involvement in the Implementation of Agricultural Nonpoint Source Pollution Control Programs,
W80-05257 5G

Reclamation and the Red Man: Relationships on the Truckee-Carson Project, Nevada,
W80-05329 6E

IRRIGATION CANALS
Final Report on Sampling and Evaluation of Archaeological and Historical Sites in or Near Bureau of Reclamation's Authorized Salmon Falls Division, Twin Falls and Cassia Countries, Idaho,
W80-05113 6B

IRRIGATION DESIGN
Irrigation Management -- A Mechanism for Saving Energy and Water,
W80-05249 3F

IRRIGATION DISTRICTS
Turn This Water Into Gold The Story of the Newlands Project,
W80-05328 6E

IRRIGATION EFFICIENCY
Irrigation Management -- A Mechanism for Saving Energy and Water,
W80-05249 3F

IRRIGATION SYSTEMS
A Dynamic Regional Impact Analysis of Federal Expenditures of a Water and Related Land Resource Project -- The Boise Project of Idaho, Part II: Secondary Economic Impacts of the Boise Project of Idaho, 1947-1970,
W80-05243 6B

ISOTHERMS
A Three Dimensional Thermal Plume Model,
W80-05163 5A

JAMES RIVER ESTUARY (VA)
Mathematical Modeling of Sediment and Contaminant Transport in the James River Estuary,
W80-05185 2J

JAVA
Application of COSSARR Model in Central Java,
W80-05226 2A

JETS
Unified Presentation of Buoyant Surface Jets in Three Dimensions,
W80-05237 8B

Bifurcation of Buoyant Jets in a Crossflow,
W80-05238 8B

JUDICIAL DECISIONS
Judicial Deference in the Submerged Lands Cases,
W80-05393 6E

JUNIATA RIVER BASIN (PA)
Regional Stochastic Generation of Streamflows Using an Arima (1,0,1) Process and Disaggregation,
W80-05291 2E

JURISDICTION
Management of Living Resources in the Northeast Pacific and the Unilateral Extension of the 200-Mile Fisheries Zone,
W80-05382 6E

KASKASKIA RIVER (IL)
Hydraulics of Flow in the Kaskaskia River,
W80-05166 2E

LABORATORY TESTS
Sediment Transport in Migrating Bed Forms,
W80-05207 2J

Using Artificial Streams to Evaluate Perturbation Effects on Aufwuchs Structure and Function,
W80-05260 5A

LAFAYETTE RIVER (VA)
Comparison of Verified Physical and Mathematical Model,
W80-05177 2L

LAKE BREEZES
Time Scales in Wind-Driven Lake Circulations,
W80-05255 2H

LAKE CHICOT (AR)
Turbid Reservoir Stratification Modelling,
W80-05172 2H

LEMONS
Nitrogen Fertilizer Management of Vigorous Lemons and Nitrate-Pollution Potential of Groundwater,
W80-05103 5B

LIFE CYCLES
Life Cycle, Ecology, and Management Considerations of the Green Filamentous Alga, Pithophora,
W80-05101 5C

LIMESTONES
Limestone Liner for Landfill Leachates Containing Beryllium, Cadmium, Iron, Nickel, and Zinc,
W80-05137 5E

Hydraulic Properties of a Limestone-Dolomite Aquifer Near Marion, North-Central Ohio,
W80-05306 2F

LIMNOLOGY
Benthic Diversity and Substrate-Fauna Associations in Lake Superior,
W80-05267 2H

Phytoplankton-Zooplankton Associations in Lake Superior: A Statistical Approach,
W80-05268 2H

LININGS
Limestone Liner for Landfill Leachates Containing Beryllium, Cadmium, Iron, Nickel, and Zinc,
W80-05137 5E

LIQUID CHROMATOGRAPHY
Concentration and Fractionation of Hydrophobic Organic Acid Constituents from Natural Waters by Liquid Chromatography,
W80-05301 1B

LITHOTHRIX
Growth and Primary Productivity of Marine Macrophytes Exposed to Domestic Sewage Effluents,
W80-05250 5C

LITTORAL
The Littoral Vegetation of Nordbytjernet, a Small Lake in South-East Norway,
W80-05318 2I

LOCAL GOVERNMENTS
The Lost Waterfront of New York,
W80-05364 6E

State-Local Relations In Coastal Zone Management Implications For Change,
W80-05381 6E

LOCK 7 (NY)
Sediment and PCB Transport Model of the Hudson River,
W80-05219 2J

LONG ISLAND (NY)
Water-Manometer Tensiometers Installed and Read from the Land Surface,
W80-05307 2G

LOYALSOCK CREEK (PA)
The Loyalsock Creek Model Study,
W80-05229 8B

MANGROVE SWAMPS
Fungi Associated with the Roots of Red Mangrove, Rhizophora Mangle,
W80-05312 2I

Accumulation of Tin by Mangrove Species in West Malaysia,
W80-05325 2I

MANNINGS EQUATION
Composite Roughness of Natural Channels,
W80-05165 2E

MANOMETERS
Water-Manometer Tensiometers Installed and Read from the Land Surface,
W80-05307 2G

MAPPING
Mapping Model for Determining Land Suitable for Irrigation,
W80-05246 7C

A Digital Overlay Technique for Evaluation of Potential Infiltration and Recharge,
W80-05261 4A

MARINE ALGAE
Growth and Primary Productivity of Marine Macrophytes Exposed to Domestic Sewage Effluents,
W80-05250 5C

Airborne Multispectral Survey of Intertidal Vegetation in Alaska,
W80-05313 2I

MARSH PLANTS
Photosynthetically Active Radiation in a Stand of Phragmites Communis Trin. IV. Stochastic Model,
W80-05314 2H

Vegetational Development and the Effect of Geese on Vegetation at La Perouse Bay, Manitoba,
W80-05317 2I

Growth, Chlorophyll and Mineral Nutrient Studies on Phalaris Arundinaceae L. in Three Scottish Lochs,
W80-05319 2I

Experimental Degradation of Detritus made from the Salt Marsh Plants Spartina Alterniflora Loisel., Salicornia Virginica L., and Juncus Roemerianus Scheele,
W80-05321 2I

MARYLAND
Runoff Simulation Model: Application and Verification,
W80-05240 2A

Water Quality Projections: Preimpoundment Case Study,
W80-05263 5B

MASSACHUSETTS
Verification of a Storm Tide Model for Boston,
W80-05173 2L

MATHEMATICAL MODELS
A Simple Numerical Solution for the Vertical Flow Equation of Water Through Unsaturated Soils,
W80-05135 2G

The Effect of Data Independence in Model Calibration and Model Testing,
W80-05141 7C

Estimating the C Factor in the Universal Soil Loss Equation for Landscaped Slopes,
W80-05147 2J

Estimating the C Factor in the Universal Soil Loss Equation for Landscaped Slopes: A Field Rating System,
W80-05148 2J

Models and Methodologies in Multi-Objective Water Resources Planning,
W80-05156 6A

Verification of Mathematical and Physical Models in Hydraulic Engineering.
W80-05159 2A

The Optimization of Pumping Operations in the El Socorro Aquifer by Mathematical Modelling,
W80-05176 2F

Introduction to Numerical Methods,
W80-05184 2E

Mathematical Modeling of Sediment and Contaminant Transport in the James River Estuary,
W80-05185 2J

NWS Operational Dynamic Wave Model,
W80-05198 2E

Effects of Equation Averaging on Model Verification,
W80-05200 2E

Stochastic Aspects of Watershed Sediment Yield,
W80-05208 2J

Subcritical Kinematic Streamflow,
W80-05213 2E

Applicability of Kinematic and Diffusion Models,
W80-05214 2E

The Numerical Dispersion of the Muskingum Method,
W80-05215 2E

The Stochastic Variation of Instream Values in Rivers,
W80-05217 5C

Stochastic Water Quality Model,
W80-05218 5B

A Sediment Yield Routing Model,
W80-05221 2J

Analysis of Sub- and Supercritical Dam-Break Flows,
W80-05223 8B

Verification of Transient Mixed-Flow Model,
W80-05224 8B

MATTOLE RIVER (CA)
The Effect of Precipitation Patterns on Surface Runoff,
W80-05233 2A

MECHANICAL EQUIPMENT
Reconnaissance Assessment of Erosion and Sedimentation in the Canada de Los Alamos Basin, Los Angeles and Ventura Counties, California,
W80-05305 2J

MEMBRANE SYSTEMS
Reverse Osmosis Technical Manual.
W80-05155 3A

METALS
A Copper Anomaly in Western Lake Superior,
W80-05275 2H

Accumulation of Tin by Mangrove Species in West Malaysia,
W80-05325 2I

METEOROLOGY
Comparison of Generalized Estimates of Probable Maximum Precipitation with Greatest Observed Rainfalls,
W80-05114 2B

Near-Shore Meteorology,
W80-05346 5A

Meteorology of the Alaskan Arctic Coast,
W80-05351 5C

METHANE
Regulation of Sulfate Concentrations and Methanogenesis in Salt Marsh Soils,
W80-05134 2L

MICROENVIRONMENT
The Influence of Thick Floating Vegetation (Water Hyacinth: Eichhornia Crassipes) on the Physico-Chemical Environment of a Fresh Water Wetland,
W80-05309 2I

MINERAL INDUSTRY
The Rights and Liabilities of a Mineral Owner Concerning the Use of Water,
W80-05392 6E

MINERAL REQUIREMENTS
Growth, Chlorophyll and Mineral Nutrient Studies on Phalaris Arundinaceae L. in Three Scottish Lochs,
W80-05319 2I

MISSISSIPPI
Prediction of River Stages,
W80-05206 2E

MIXING
Verification of Transient Mixed-Flow Model,
W80-05224 8B

MODEL STUDIES
Analysis of Borehole Infiltration Tests Above the Water Table,
W80-05108 2G

Model Predictions of Effects of Impoundment on Particulate Organic Matter Transport in a River System,
W80-05116 2J

Computationally Efficient Polynomial Approximations Used to Program the Theis Equation,
W80-05121 6A

Programmable Hand Calculator Programs for Pumping and Injection Wells: II--Constant Pumping (Injection) Rate, Single Fully Penetrating Well, Semiconfined Aquifer,
W80-05122 6A

Ground-Water Modeling: An Overview,
W80-05123 2F

Determination of Aquifer Parameters from Step Tests and Intermittent Pumping Data,
W80-05125 2F

Approximation for Salt-Water Intrusion in Unconfined Coastal Aquifer,
W80-05126 2L

An Application of Brutsaert's and Optimization Techniques to the Nonlinear Diffusion Equation: The Influence of Tailing,
W80-05136 2G

Comparison Between Measured and Simulated Plant Water Potential During Soil Water Extraction by Potted Ryegrass,
W80-05138 2G

The Effect of Data Independence in Model Calibration and Model Testing,
W80-05141 7C

An Interactive Simulation of Pumped Storage Reservoir Systems,
W80-05142 4A

A Note on Changes in Channel Geometry at Tributary Junctions,
W80-05143 2E

A Physical Model for the Transport and Sorting of Fine-Grained Sediment by Turbidity Currents,
W80-05145 2J

Models and Methodologies in Multi-Objective Water Resources Planning,
W80-05156 6A

Verification of Mathematical and Physical Models in Hydraulic Engineering.
W80-05159 2A

Field and Model Results for Multiport Diffuser Plume,
W80-05160 5B

A Three Dimensional Thermal Plume Model,
W80-05163 5A

Calibration of the Edwards Aquifer Model,
W80-05167 2F

Steady State vs. Transient Parameter Estimation in Groundwater Systems,
W80-05168 2F

An Optimization Technique for a Mathematical Urban Runoff Model,
W80-05169 4C

An Analysis of Total Phosphorus Transport in River Systems,
W80-05171 5B

Turbid Reservoir Stratification Modelling,
W80-05172 2H

Verification of a Storm Tide Model for Boston,
W80-05173 2L

Groundwater Simulation for Koeberg Power Station,
W80-05174 2L

Comparison of Verified Physical and Mathematical Model,
W80-05177 2L

A Dynamic Estuary Model of Charleston Harbor,
W80-05178 2L

Verification of an Estuarine Model for Apalachicola Bay, Florida,
W80-05179 2L

Verification of a York River Ecosystem Model,
W80-05180 5C

Simulation of Algal Growth in the Chowan River,
W80-05181 5C

Physical Model Study for Improved Navigation Channel Design,
W80-05182 8B

Mathematical Models for Navigation Channel Design,
W80-05183 8B

Radial Source-Sink Flow in Stratified Ocean,
W80-05186 8B

Field Verification of a Hydrothermal Model,
W80-05187 5B

Vortex Formation in a Powerplant Collection Basin,
W80-05188 8B

Examples of Propagation Problems,
W80-05189 2E

A Mathematical Model for Water Quality Analysis,
W80-05190 5B

Water Quality Modeling Using Hydrocomp Simulation Programming (HSP),
W80-05191 5B

Calibration of Urban Nonpoint Pollution Loading Models,
W80-05192 5B

Model Verification Using the Plug-Flow Technique,
W80-05193 5B

Compound Weir Discharge,
W80-05194 8B

Verification of Prototype Spillway Performance,
W80-05195 8B

An Experimental Investigation of Uplift Pressures,
W80-05196 8A

Surface Flow in a Two-Bay Water Diversion,
W80-05197 8A

Planning Implications of Waste-Load Assimilative Capacity of Coleman Creek and Flat Creek, Mecklenburg County, Virginia,
W80-05199 5B

Mathematical Thermal Model for Pumped-Storage,
W80-05201 2H

Verification of Finite Element Hydrodynamic Model Cafe,
W80-05202 2L

Verification of a Numerical Flow Model for Carolina Beach Inlet, North Carolina,
W80-05203 2L

Tidal Circulation in Coastal Seas,
W80-05204 2L

Prediction of River Stages,
W80-05206 2E

An Electronic Model of Harbor Waves,
W80-05210 2H

Verification of Fixed-Bed Estuarine Models,
W80-05211 2L

Sediment and PCB Transport Model of the Hudson River,
W80-05219 2J

Sediment Movement in a Small Humid Watershed,
W80-05220 2J

Field Test of a Distributed Sediment Yield Model,
W80-05222 2J

Development of Makeup Line Safe Operating Criteria,
W80-05225 8B

Application of COSSARR Model in Central Java,
W80-05226 2A

Upper St. Johns River Basin Water Management Model,
W80-05227 2A

Field Verification of Sediment Transport Model,
W80-05228 2L

Sediment Model Verification for Small Diversions,
W80-05230 2J

Bed Load: Definition and Measurement,
W80-05231 7B

The Effect of Precipitation Patterns on Surface Runoff,
W80-05233 2A

Linearized Subhydrographs Urban Runoff Model,
W80-05234 2A

On the Scaling of Laboratory Oxygenation Studies,
W80-05236 5G

Unified Presentation of Buoyant Surface Jets in Three Dimensions,
W80-05237 8B

Bifurcation of Buoyant Jets in a Crossflow,
W80-05238 8B

Assessing Land Use Changes With an Urban Runoff Model,
W80-05239 2A

Runoff Simulation Model: Application and Verification,
W80-05240 2A

Two-Dimensional Tidally Averaged Estuarine Model,
W80-05251 2L

Water Quality Modeling in the Upper Reaches of the Chowan River,
W80-05253 5B

Water Quality Projections: Preimpoundment Case Study,
W80-05263 5B

Simulation of Water Circulations and Chloride Transports in Lake Superior for Summer 1973,
W80-05280 2H

Regional Stochastic Generation of Streamflows Using an Arima (1,0,1) Process and Disaggregation,
W80-05291 2E

A Plan to Study the Aquifer System of the Central Valley of California,
W80-05296 6A

Digital-Transport Model Study of Diisopropylmethylphosphonate (DIMP) Ground-Water Contamination at the Rocky Mountain Arsenal, Colorado,
W80-05297 5B

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for South Fork Wildcat Creek, Clinton County, Indiana,
W80-05299 6A

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation

Study for Cedar Creek, Dekalb and Allen Counties, Indiana,
W80-05302 5B

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for Wildcat Creek, Howard County, Indiana,
W80-05303 5B

Photosynthetically Active Radiation in a Stand of Phragmites Communis Trin. IV. Stochastic Model,
W80-05314 2H

Modeling of Tides and Circulations of the Bering Sea,
W80-05350 5A

Beaufort and Chukchi Sea Ice Motion. Part 2: Onset of Large Scale Chukchi Sea Ice Breakout,
W80-05359 5A

MONITORING
Requirements of State Regulatory Agencies for Monitoring Ground-Water Quality at Waste Disposal Sites,
W80-05129 5A

MONTANA
Water Resources Data for Montana, Water Year 1978.
W80-05290 7C

MOSSES
The Occurrence of Bryophytes on British Saltmarshes,
W80-05308 2I

Transplanting Aquatic Bryophytes to Assess River Pollution,
W80-05311 5A

MOVEMENT
A Stochastic-Dynamic Approach to the Foundations of Solute Transport in Porous Media,
W80-05216 5B

Dynamics of Near-Shore Ice,
W80-05341 5A

The Transport and Behavior of Oil Spilled In and Under Sea Ice - Task 1,
W80-05362 5A

MULTIPLE OBJECTIVES
Models and Methodologies in Multi-Objective Water Resources Planning,
W80-05156 6A

MUNICIPAL WASTES
U.S. Heavy Metal Loadings to the Great Lakes: Estimates of Point and Nonpoint Contributions,
W80-05335 6A

NATIONAL PETROLEUM RESERVE IN ALASKA
Reconnaissance Snow Surveys of the National Petroleum Reserve in Alaska, April 1977 and April-May 1978,
W80-05294 2C

NATURAL GAS
Liquefied Natural Gas Terminal Siting in the California Coastal Zone: The Scope of Permissible State Authority,
W80-05383 6E

NATURAL STREAMS
Composite Roughness of Natural Channels,
W80-05165 2E

NAVIGATION
Physical Model Study for Improved Navigation Channel Design,
W80-05182 8B

Mathematical Models for Navigation Channel Design,
W80-05183 8B

NEBRASKA
An Appraisal of Cultural and Paleontological Resources Within Sections 1 and 2 of the Proposed Mirdan Canal Project, Garfield and Valley Counties, Nebraska,
W80-05109 6B

Mapping Model for Determining Land Suitable for Irrigation,
W80-05246 7C

NEVADA
Turn This Water Into Gold The Story of the Newlands Project,
W80-05328 6E

NEW ENGLAND
Comparative Nutrient Dynamics of a Marsh-Mudflat Ecosystem,
W80-05131 5B

The Effect of Tidal Resuspension on the Distribution of Intertidal Epipelic Algae in an Estuary,
W80-05132 2L

Tidal Circulation in Coastal Seas,
W80-05204 2L

NEW JERSEY
Reactor-Released Radionuclides and Fine-Grained Sediment Transport and Accumulation Patterns in Barnegat Bay, New Jersey and Adjacent Shelf Waters,
W80-05130 5B

Trends in Environmental Litigation: A Survey of 1976 New Jersey Judicial Decisions,
W80-05387 6E

NEW RIVER (VA)
Invasion, Population Dynamics and Elemental Accumulation of Corbicula Fluminea in the New River at Glen Lyn, Virginia,
W80-05332 5C

NEW YORK
The Lost Waterfront of New York,
W80-05364 6E

NEW ZEALAND
Identification of Plant Fragments and Pollen from Peat Deposits in Rangitaiki Plains and Maketu Basins,
W80-05326 2I

NITRATES
Nitrogen Fertilizer Management of Vigorous Lemons and Nitrate-Pollution Potential of Groundwater,
W80-05103 5B

A Comparative Study of Nitrate Levels at Three Adjacent Ground-Water Sources in a Chalk Catchment Area West of London,
W80-05128 2F

NITROGEN
Nitrogen Fertilizer Management of Vigorous Lemons and Nitrate-Pollution Potential of Groundwater,
W80-05103 5B

Nitrogen and Phosphorus Hydrochemistry in Las Vegas Wash,
W80-05107 5C

NITROGEN FIXING BACTERIA
Nitrogen Fertilizer Management of Vigorous Lemons and Nitrate-Pollution Potential of Groundwater,
W80-05103 5B

NORFOLK (VA)
Comparison of Verified Physical and Mathematical Model,
W80-05177 2L

NORTH CAROLINA
Simulation of Algal Growth in the Chowan River,
W80-05181 5C

Verification of a Numerical Flow Model for Carolina Beach Inlet, North Carolina,
W80-05203 2L

Phosphorus Dynamics in a North Carolina Piedmont Reservoir,
W80-05244 2H

Second Homes in North Carolina: An Analysis of Water Resource and Other Consequences of Recreational Land Development,
W80-05248 6B

Biogenic Sedimentary Structures Produced by crabs in Lagoon Margin and Salt Marsh Environments Near Beaufort, North Carolina,
W80-05320 2I

POROUS MEDIA
A Stochastic-Dynamic Approach to the Foundations of Solute Transport in Porous Media,
W80-05216 5B

PORT WASHINGTON (WI)
An Electronic Model of Harbor Waves,
W80-05210 2H

POULTRY PROCESSING
Ultrafiltration Treatment of Poultry Processing Wastewater and Recovery of a Nutritional By-Product,
W80-05330 5D

POWERPLANTS
Invasion, Population Dynamics and Elemental Accumulation of Corbicula Fluminea in the New River at Glen Lyn, Virginia,
W80-05332 5C

PRECIPITATION (ATMOSPHERIC)
Users Guide for the Analysis and Interpretation of Satellite Imagery on the High Plains Summer Cloud and Mesoscale Systems,
W80-05111 7B

Comparison of Generalized Estimates of Probable Maximum Precipitation with Greatest Observed Rainfalls,
W80-05114 2B

The Effect of Precipitation Patterns on Surface Runoff,
W80-05233 2A

Water Budgets for Lake Superior and Whitefish Bay,
W80-05281 2H

PRIMARY PRODUCTIVITY
Statistical Evaluation of the Relationships Between Phytoplankton Biomass, Chlorophyll A, and Primary Production in Lake Superior,
W80-05270 2H

PRIOR APPROPRIATION
Res Judicata - Will It Stop Instream Flows from Being the Wave of the Future.,
W80-05400 6E

PROBABILITY
Empirically Derived Probability Estimates of Drought Parameters for Western United States Back to 1700 A.D.,
W80-05247 2B

PROBABLE MAXIMUM PRECIPITATION
Comparison of Generalized Estimates of Probable Maximum Precipitation with Greatest Observed Rainfalls,
W80-05114 2B

PROJECTIONS
Lake Superior in the 21st Century,
W80-05265 6B

PUBLIC ACCESS
The Urban Coast From a National Perspective,
W80-05363 6E

PUMPED STORAGE
An Interactive Simulation of Pumped Storage Reservoir Systems,
W80-05142 4A

Mathematical Thermal Model for Pumped-Storage,
W80-05201 2H

PUMPING
Programmable Hand Calculator Programs for Pumping and Injection Wells: II--Constant Pumping (Injection) Rate, Single Fully Penetrating Well, Semiconfined Aquifer,
W80-05122 6A

Determination of Aquifer Parameters from Step Tests and Intermittent Pumping Data,
W80-05125 2F

RADAR
An Investigation of Satellite-Radar Correlation Functions,
W80-05110 7B

Data Processing and Analysis from H-F Radar Data Obtained in Cook Inlet Alaska During Summers 1977 and 1978,
W80-05337 5A

A New Technique for Measuring Tidal Currents Using a Two-Site HF Doppler Radar System,
W80-05338 5A

RADIOACTIVE WASTE DISPOSAL
The Silurian Salt Deposits in Eastern Lake, Northwestern Ashtabula, and Northeastern Geauga Counties, Ohio,
W80-05295 5E

RADIOISOTOPES
Reactor-Released Radionuclides and Fine-Grained Sediment Transport and Accumulation Patterns in Barnegat Bay, New Jersey and Adjacent Shelf Waters,
W80-05130 5B

RAINFALL
An Investigation of Satellite-Radar Correlation Functions,
W80-05110 7B

Comparison of Generalized Estimates of Probable Maximum Precipitation with Greatest Observed Rainfalls,
W80-05114 2B

Stochastic Analysis of Annual Rainfall Affected by Urbanization,
W80-05119 2B

RAINFALL DISPOSITION
Stochastic Analysis of Annual Rainfall Affected by Urbanization,
W80-05331 2B

REAERATION
On the Scaling of Laboratory Oxygenation Studies,
W80-05236 5G

RECHARGE
Computationally Efficient Polynomial Approximations Used to Program the Theis Equation,
